No 54653

Extract from the Political Code.

SECTION 2296. Books may be taken from the Library by the MEMBERS OF THE LEGISLATURE, DURING THE SESSIONS THEREOF, and by other State officers at any time.

SEC. 2298. The Controller, if notified by the Librarian that any officer has failed to return books taken by him within the time prescribed by the Rules, and after demand made, must not draw his warrant for the salary of such officer until the return is made, or three times the value of the books, or of any injuries thereto, has been paid to the Librarian.

SEC. 2299. Every person who injures or fails to return any book taken is liable to the Librarian in three times the value thereof.

No person shall take or detain from the General Library more than two volumes at any one time, or for a longer period than two weeks. BOOKS OF REFERENCE SHALL NOT BE TAKEN FROM THE LIBRARY AT ANY TIME.—[Extract from the Rules.]

☞The foregoing Regulations will be strictly enforced.☜

INV. 1893.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, JULY 2, 1881.

VOLUME XLIII Number 1.

Prospectors as Trustees.

The practice of outfitting prospectors and paying their expenses while they are engaged in exploring, has been a common one on this coast. It has fallen of late somewhat into disuse, however. It was formerly a common thing for men in this city to keep prospectors at work in different sections of country for months at a time. This was specially the case in new regions where "excitements" prevailed. A certain class of miners lived for years in this way. They were clothed, fed, had a little pocket money, and sometimes small wages. In return for this they were to "locate" their patron in all claims discovered by them.

The practice, though still in vogue, is not nearly so much so as it used to be, since the men were not always proved worthy of the confidence bestowed upon them. They would locate their patron in several dozen claims, but when they found a first-class ledge they would not be so particular. We speak now of the class of "prospectors" who would come to the city for just such opportunities, and who cared more really for a steady "grub stake" than for doing any very hard work.

Suit has been commenced in the Superior Court in this city which will prove, in all probability, how far prospectors are liable for agreements they enter into to locate those who pay their expenses in the claims they find. The suit is by Joseph S. Emery against Guadalupe Mason, executrix of the estate of Charles G. Mason, deceased, *et al.*, on a complaint which alleges that Charles G. Mason died July 29, 1878; that in August, 1863, plaintiff and deceased entered into a contract whereby plaintiff furnished deceased $500 in money, tools and provisions for a prospecting tour, to locate, buy and become interested in mines of gold and silver, in consideration for which advance he was to give to plaintiff one-half of all the proceeds of such tour; that deceased proceeded to the Florence mining district, Pinal, Arizona Territory, and located and took up the Silver King mine, with others, his interest being one-half the mine; that in February, 1877, he returned and sold his interest to James M. Barney for property on Market street, near Ellis, valued at $200,000. Plaintiff alleges that under the contract all the acts of deceased were performed as trustee for plaintiff, and asks judgment for an order decreeing a transfer of one-half the property, and for $18,200, as by an alleged accounting of rents and profits of the property, found to be due plaintiff.

Sutter's Mill.

The accompanying illustration will call to the minds of many pioneers of California pleasant reminiscences of those favored and long to be remembered days, the "days of '49." It represents Sutter's mill, where the first practical discovery of gold was made, which led to the "excitement" of 1849, and the immense influx of people from all parts of the world to our shores, ultimately resulting in the opening of the gold fields of the Sierras, the civilization and settlement of our State; the discovery of the unbounded field of mineral country on the Pacific Coast; and the development of the numberless resources of much-famed California, as well as adjacent States and Territories.

Sutter's mill was situated on the South Fork of the American river, in El Dorado county, for a time known as the Empire county of the State. The site was in a pleasant valley, as the engraving shows. The mill, we believe, was never completed, and the sketch shows it as it was left at that time. Among the persons who were there at the time of the discovery of gold were J. W. Marshall, E. Pierson, John Weimer, Peter Weimer, W. H. Scott, A. Stephens, H. Bigler and C. Bennett. The engraving of this historic locality was made from a painting by the late Charles Nahl, which was from a sketch made by him in 1851. The painting formerly belonged to A. Roman, Esq., but is now the property of Mr. Julius Jacobs of this city.

At the time of the discovery, Coloma contained a double log cabin and about 18 persons, exclusive of Indians. Of the history of the discovery of gold, by J. W. Marshall, we have spoken frequently, and have given a good deal of the discussion relative to the question connected with the event. It is not, therefore, necessary to repeat the facts or their reasons. The picture we give is a historical one, worthy of place in every miners' cabin.

SUTTER'S MILL, WHERE GOLD WAS FIRST DISCOVERED IN CALIFORNIA, JANUARY 19, 1848. FROM A PAINTING BY NAHL.

MINING ACCIDENT.—A very sad accident took place recently at the Delano mine, Tulare county, by which the son of Louis Latroadec, of this city, narrowly escaped with his life. The young man was employed as machinist at the mine, and had descended into the shaft for the purpose of oiling the machinery. This done he came to the surface, and in walking across the plank placed at the mouth, it turned and precipitated him to the bottom of the shaft, a distance of 96 ft. Both his legs were broken by the terrible fall.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

Proofs of the Existence of at Least Two Inter-Mercurial Planets.

Editors Press:—You probably havs seen a long communication the *Alta California* kindly puhlished for me, Friday, Jnne 10th, relative to inter-Mercurial planets. The accompanying article is a kind of condsnsation and extsnsion of it to Vnlcan's position, May 17, 1882, during the total solar eclipss as well. The letter rsfers to a correspondence witb M. Aymer de la Baume, in Paris, who is preparing a work on intsr-Mercurial planets. His proofs of the existence of at least two. His distinction of the Lsscarbault-Lsverrier planet of March 26, 1859, from the Lichtenburg planet of November 19, 1762, and its re-observance by Mr. W. G. Wright, October 24, 1876, at San Bsrnardino, Califoruia, and identity with Hofmann's planst, 1764, Scott, June, 1847, and Ritter and Schmidt, June 11, 1855. Want of dates or periods of apparent revolutions in M. Baume's letter. My computations of what they may be to harmonize the whole series, ahout 33.785 days. Also, with the late Prof. Watson's observations, regarded by M. Gaillot near its inferior conjunction during the total solar eclipse of July 29, 1878. The computation continned to a possible transit next September 19th, at 4:31 A. M., (say six honrs duration before and after), but more probably October 22d, 11:21½ P.M., or not until April 9th, 5:45 A. M., 1882. Position of Wright's Vulcan or the Litchtenberg Vulcan of Novemher 19, 1762, on or at May 17, 1882, during the next solar total eclipse, probahly ahout four and a half days past its inferior conjunction, but hetter situated than when observed hy Prof. Watson, July 29, 1878.

While M. de la Baume has no hesitation in coupling Mr. Wright's California observance of October 24, 1876, with Lichtenhurg's, Novemher 19, 1762, as well as Hofmann, May, 1764 (withont specifying date) and Scott and Wray, June, 1847 (also without date), and Ritter and Schmidt, Jnne 11, 1855, he regards it as impossible to unite them with the series of Fritsh, Octobar 10, 1802; De Cuppis, Octoher 2, 1839; Lescarbault, Marcb 26, 1859, or Lummis, March 19, 1862, justly remarking that the planet was evidently at or near one of its nodes in each case, and would he again about six months before and after. Leverrier, I believe, laid down that rnle in regard to Lescarbault's planet, March 26, 1859, the corresponding date being September 24, 1859 or 1860, for a prohable transit then. He adds that "it is true that transits can occur when the planet is not quite at its nodes, bnt the distance cannot he very great, otherwise the Vulcanian orbit would he scarcely inclined upon the ecliptic, and then the transits would become so common that they ought to be frequently observed. M. Baume also remarks that to make the observations of 1859 aud 1876 agree, we must admit that in 17 years the displacement has been 30 days, or from September 24th to October 24th, which is hardly admissible, considering that Mercury and Venus can't produce such a perturbation in the inter-Mercurial planet's motion. Venus only shifts its nodes one day per century. The other transits of supposed inter-Mercurial planets lead us to think that the nodes are shifted *backward* instead of *forward*, as the following table will show, he thinks:

Date.	Observer.	The planet at the Nodes.
1802, Oct. 10,	Fritsh	Oct. 10 and April 11.
1839, Oct. 2,	DeCuppis	Oct. 2 " April 3.
1859, March 26,	Lescarbault	Sept. 24 " March 26.
1862, March 19,	Lummis	Sept. 17 " March 19.

"So that in 1876 the transit ought to occur before Sept. 17th or hefore March 19th to be identified with Lummis' and Lescarbault's observations." M. de la Baume may he right about that, but the amount of displacement is not quite so clear, for, as we may observe that from March 26, 1859 to March 19, 1862 there is absolutely *seven* days in *three* years. How much might there he in 17 years, or from 1859 to 1876? Instead of only 30 days it seems to make 39.666 days. I do not wish to intimate that it may he so. But then again observe that from 1802 to 1839 the displacement is from October 10th to Octoher 2d, which is seemingly backward only eight days in 37 yeare, but if forward, is 357 days in 37 years, while three years as above seemed to call for seven days displacement in the Lescarhault-Lummis interval.

The same proportion would require 86½ days displacement in 37 years, instead of 357 days, which the dates make it. That inquiry evidently requires some other explanation, therefore; hut however iuteresting to students, it rather led me away from the object of my letter to the *Alta California*, which was to *show the apparent period of Vulcan's revolutions*. I therefore omitted all reference to the seeming discrepancy ahout the displacement. I mean the apparent period in connection with the Lichtenhurg, Hofmann, Scott and Scbmidt observations, bronght down to Wright's observation of transit, Oct. 24, 1876, and if possihle to Prof. Watson's, of July 29, 1878. As a Californian I felt proud, as I did in 1876, of Mr. Wright's success, and now again that the Frcnch astronomer recognized tbat it supplied one of the links in the series heginning with Lichtenburg, 114 years ago; M. Leverrier indssd traced a series hack to soms time in 1750. (I never conld find ont what date, although, perhaps, taking some of his hypothetical periods, I might have compnted it.) Iu the present consideration of M. de la Bsume's remarks, I preferred to see what results I ond obtain from the data he affordsd me, and I proceedsd as follows: I first noticed the long interval from November 19, 1762, to Schmidt, June 11, 1855, which I made ahout 33,784 days, and then from Jnne 11, 1855, to M. Wright's, at San Bernardino, Octohsr 24, 1876, making 7,806 days; hut not having the clock time in 1762 or 1855, and as it was not likely to be identical, and it was desirahls for the psriods to accord as nearly as possible in working np the two intervals, I assnmed the long one at about 33,785 days, and shorter one at 7,805 days. Then the formsr might he divisible by apparsnt periods of 33.785 days, and the latter by 33.787878 days. Such a prssumption did not sesm unlikely in view of ths prohable fact that rather irregular periods may bs caused by Mercury's perturbations.

The next point was to gct the Hofmann interval, but here I was at a loss for date, so, taking periods of 33.785 days from Novemher 19, 1762, it gave me May 11 or 12, 1764, for Hofmann. If that shonld happen to be near correct, it will he highly satisfactory. I took 16 periods for the trial. Then with regard to Scott's transit, my notes from the *American Journal of Science* for 1860, Vol. 29, page 296, gave *about mid-summer* for the date in June, 1847. Now, while June 24th is regarded as mid-summer in England, 86 periods of 33.785 days each, backed from June 11, 1855, would take us to Jnne 27 or 28, 1847, which again may he nearly correct; and in that case, of conrse, just as satisfactory as Hofmann. But in either case some allowance may be prohably due for irregularity of Vulcanian periods. Assuming therefore, that 33.785 days might approximately fit these several intervals, I proceeded to try it npon the interval from Wright's observation to Prof. Watson's, or from Oct. 24, 1876, to July 29, 1878. And here again I fonnd approximate accord in the apparent position Prof. Watson found the planet, ahout 2° from the snn, provided we may incline to Gaillot's interpretation of the Lsverrier formula, requiring the planet to be *near the inferior conjunction*, instead of *superior* conjunction, as Prof. Watson supposed it was at the time. I have not yet, of course, seen the detailed report which be or his representatives submitted to Washington recently, but my present hypothesis would put the planet a little more than one day past the inferior conjunction. (The report I see affirms two new planets).

The same periods would make a conjunction to have occnrred a few days since June 9th or 10th, and carry us on to next September 19th or October 22d for possible transit, or not until April 9, 1882. In my computation I have assumed that Mr. Wright's transit was about central at 2 P. M., October 24, 1876. His observation was not made until 3 P. M., and again at 5 P. M.; but at 3 P. M. the diagram in the *Scientific American*, of November 18, 1876, shows the planet had passed the center of the sun at—say ahout 2 P. M., which would make the clock-time for September 19th, 4h. 31m. A. M., or October 22d, 11h. 21½m. P. M.—the latter heing so near the 24th or Wright's anniversary of transit, makes it the most prohable interval for a transit if it can occur this year. [Note.—*Nature* of October 26, 1876, said Leverrier considered a transit possihle in September or October, 1881, (see Paris Academy of Sciences), or not until 1883 or 1885,—see also, *Scientific American*, November 18, 1876.] I make the clock-time for April 9th, 5h. 45m. A. M., San Bernardino time, or six hours hefore and after duration of transit, if a transit at all, or rather csntral one, May 17, 1882, is, I believe, the time for the next total solar eclipse, althongh the nautical almanacs not having reached the State Library, I have seen no particulars of it or diagram, which I am anxiously waiting for. At that date, however, my hypothesis makes the planet to have passed its 60th revolntion from October 24, 1876, ahout four and one-half days, which should afford a better observation than Prof. Watson obtained during the total solar eclipse of July 29, 1878; but, as yet, I bave not learned where the total eclipse will be visible best. [Note.—*Nature*, June 2, 1881, says at Teheran, Egypt, at the Indo-European telegraph offices.] I trust the State Library will soon receive the almanacs, which are long overdue. Of course tbese remarks do not pretend to he conclusive, hut they indicate very satisfactory accord with 119 years of records, or if extended to the year 1750, would make whole periods agree with any of the following dates: December 13th, Novemher 10th, October 7th, September 3d, August 1st, June 27th, May 25th, April 21st, March 18th, February 12th or Jannary 9th. Probably November 10th, or May 25th would best accord with the planet's nodes in connection with the assumed periods of 33.785 days. I would like very much to know what date in 1750 Leverrier had reference to, which was noticed in the *Scientific American* of Octoher 21, 1876. Indeed, I would he very glad to see the details of the 30 observations there alluded to about which time Leverrier computed revolutions of 28.00774 days sidereal, I presume, and with reference to Lescarbault's planet of March 26, 1859.

A. F. Goddard.

Sacramento, June 13, 1881.

Note on Treeless Prairies.

At a late meeting of the Academy of Sciences, of Philadelphia, Mr. Thomas Meehan remarksd that the absence of timhsr or arborescent growth on the grassy prairies of America still continued to hs a matter of controversy, hut he bslieved that in the light of accumulating evidencs we might now come to a positive decision in regard to the question. The most prevalent hslief had been that tress would not grow on these prairies, and we have had theories relating to soil or climate to show why they could not grow. Then tbere were others who believed that trees did grow there in ancient times, but had been burnt off, and kept burnt off by annual fires.

Mr. Meehan considered in detail the anthors who had propounded various thsories, and the distinguished men who had advocated them, and said that it was evidsnt climate could have nothing to do with the question, because in these prairie regions there were oftsn large belts of timber lands, projected like hnge arms into the grassy rsgions, with prscisely the same climatal conditions ovsr both. That the soil was not unfavorable, was proved now by the artificial plantations everywhere snccessful, and that the soil was unfavorable to the germination of tree seed, as suggested by Prof. Whitney, was on the face of it untenable, from tbe fact that it requnired bnt the same conditions for the seed of trees as for those of herbaceous plants, the number of species of which on tbe prairies was well known to be very large. Another great gain to our present knowledge was that since the annual firing of the grassy prairies had been discontinued by tbe advance of civilization, the timber was everywhere encroacbing on them. Among the facts wbich he offered in proof of this, was a reference to page 505 of tbe seventh "Report of the Geological Survey of Indiana," where Dr. Schenck shows how land which was once grassy prairie is now covered with a luxuriant growth of forest trees; to the evidence of Major Hotchkiss, Geologist of Staunton, Vir., that the Shenandoah valley, now heavily timbered, was clear of trees in the early history of Virginia; to the discovery of buffalo bones in caves near Stroudsburg, Pa., by Dr. Josepb Leidy, now a timbered region, the huffalo ouly existing in open, grassy countries;* and to various traditions of settlers in some valleys now timbered that the land was originally clear of trees. He pointed out that in all known parts of the United States at the present time, except the arid regions, where only drought-loving plants could exist, the natural result of freedom was the succession of forest growth. Seeds were scattered by winds or animals over acres of cleared land. If sucb land became neglected, these, again seeding in time, extended the forest area continually. The tallest growing vegetation, like trees, crowded out the weaker, and the forest naturally crowded out the lower growing and weaker herbaceous plants. He illustrated this by reference to the neglected cotton-fields of the Southern States.

From all this, tbe speaker said that it was evident that there was nothing in nature, either now or in the past, to prevent the gradual encroachment of the forest over the grassy plains; till long before the white man came here the whole would have been completely covered by arborescent growth. Were there any artificial causes equal to the exclusion of trees, and yet permitting an herbaceous growth? If we were to sow a piece of land in the autmnn with some tree-seed and some seeds of annuals, the latter would be up, flower, mature and scatter their seed to the ground before the next autumn, and many of these seeds would he washed into the earth, or drawn into the earth by insects or small animals. But tree-seed would make young trees, which would not again produce seed for 10 or more years. If now, at the end of this first season, a fire swept over the tract, the seeds of the annuals which had found a slight earthly protection would come up again the next summer, again seeding and extending the area. The trees wonld he burned down, and, though perhaps many would sprout, successive burnings would keep them confined to one place. In short, under annual burnings, herbaceous plants could still increase their area annually, but trees conld never get far beyond the line they had reached when the annual fire first commenced. There could be no doubt that an annual burning in a tract destitute of forest growth, would certainly prevent the spread of timber, or of any plant that required more than a year to mature seed from the time of sowing. Now, if we look at the actnal facts, we find that the Indians did annually fire the prairies.

Father Hennepin, the earliest writer on Indian habits, noted that it was the practice in his time. There is little doubt but this practice of annual burning bas been one extending long into the past. What object had they in these annnal burnings? They must have known that the buffalo and other animals on which they were largely dependent for a living, throve only on huge grassy plains, and that it was to their interest to preserve these plains by every means in their power. Low as their power of reasoning may be, they could not hut have perceived that while grassy herbage throve in spite of fires, perhaps improved under the fiery ordeal, tress could not follow on hnrned land. What could he more natural than that they would hurn the prairies with the object of retaining food for their wild animals? If we have no difficnlty in reaching a positive conclnsion so far, we may now take a glance at the early gsological times. Mr. Meshan then referred to the researches of Worthen, Whittlesley and others, in Ohio, Illinois and other prairie regions. On the retrsat of ths great glacier, ths higher land and drift formation were probahly high and dry long hsfore the immsnss lakes formsd from the melting and turhid waters ceased to he.

It was tolerably well understood tbat many spscies of tress and other plants which required a tempsrate atmosphere, retreated southwardly with the advance of the glacier, and advancsd to higher latitudes on the glacier's retreat. Thus thsss bigher ridgss would become timbered long hsfore the lower lands became dry. Evidsnce accumulates that man existed on this continent, in the far west, not long after the glacier retreated, though "not long," in a geological sense, may msan many hundreds of years. The lakes of glacial water would gradually become shallowsr from highor land, from ths wearing away of rocky brsastworks as in Sonth pass, Illinois, as well as from the opsnings which would continnally occur from nature's over varying plan of streams under ground. In all events, the drying of these lakes would bs from their outward edges first. Aquatics would give way to marsh grasses, and these to vegstation snch as we now find gensrally spread over the prairie region. If now we can conceive of human hsings such as we know the Indian races to be, already in more southern latitudes—haviug learned the fact that firing would keep down trees and aid in the preservation of the chase—following the retreat of the glacier to the higher lands, and still as they advanced northwardly, firing the plains up to the water's edge, it would certainly account for the absence of arboreal vegetation from these immense lacustrine lands from the very beginning of their formation. Of conrse with this view we should have to look for some evidences of man's existence, both on the lands which were once under water, as well as those which were timher lands at his first appearance there. He did not know how many such evidences have heen or may he found. Man's traces in the past are at hest but rare, and they would naturally be much more scarce in the lacustrine regions than in lands dry at the same epoch. At any rate, this part of his remarks, he said, must be taken as mere speculation; but, as we could see on the basis of sound scientific investigation why there could be no trees on these grassy prairies within the range of indubitable history, it was a fair inference that some such cause had continued from the heginning; namely, that annual firee had ever been the reasou why arborescent vegetation bad never had an existence there.

* Since these remarks were made, it has been brought to the attention of the author, that the bones may have belonged to the wood huffalo.

Our Northern Counties.

Our inland exchanges are talking a good deal of railroad just now, but there is one idea that they seem entirely to overlook—a cross country railroad, conuecting the northern end of California with Humholdt bay. While railroad connection with the metropolis is desirable, perhaps, beyoud all other internal improvement, yet we are deeply impressed with the very important matter of opening a more intimate commnnication hetween our Northern California counties. And there is a principal involved that should earnestly engage the minds of all progressive and enterprising men whose interests permanently lie in the seven northern counties of California, namely, Del Norte, Siskiyon, Modoc, Lassen, Shasta, Trinity, and Humholdt, and to a certain extent, the adjoining territory of Oregon and Nevada. So long as these counties remain simply segregated tributaries of the metropolis of San Francisco, their progress and prosperity will be limited to the mere habit of tributary provinces. To connect with San Francisco will he good in many things, but when the people of the iuland counties become subject to a single line of transportation, the exactions of a single and great corporation, they will learn that there must be an offset to halance, an outlet which will he an alternative, and which will govern and regnlate the power of the carrying traffic. Humboldt bay offers far better advantagss as a shipping port tban any point on the California Coast outside of San Francisco, and while we do not wish it for a moment to be understood that we suggest it as a rival for San Francisco, yet we do suggest and propose it as a secondary port, for the use, convenience, and accommodation of this great northern couutry. We see nothing to prevent the feasihility of such a theory, and everything to urge in its favor. The carrying out of intercommunication would at once make our northern counties mutnal in their intercsts and retro-active in their influence upon one another. The area comprises a territory of fertile valleys and wooded mountains. It contains rich mines and navigable rivers, and while it is the healthiest part of the globe, and is productive in the highest degres, yet the lack of intercommunication leaves each little locality, however rich within itself, in comparative isolation. Northern California must awaken to the fact that she is posessed of all that could he required to make a community great, hut that iu order to develop we mnst cultivate a mutual sympathy, interest, and relationship between our different sections and counties and propose and demonstrate some mutnal scheme for advancement and development.—*Eureka Standard.*

MECHANICAL PROGRESS.

Malleable Cast Iron.

Malleable cast iron is cast iron simply heated to a limited degree, the heat continued for a greater or less time—from 2 to 8 days, according to the thickness of the castings and the perfectness of the work desired—and then allowed to cool very gradually.

The first authentic recognition of malleable iron was at the fair of the Franklin institute, in the summer of 1828, where a general assortment of buckles, bits and some other small articles were shown as "annealed cast iron." Since that time the business has grown rapidly and become one of great mechanical and commercial value.

Wrought iron is sometimes annealed, as when designed for special purposes; but the heat for such purpose is not continued so long, or the cooling done so gradually. The harder the cast iron the longer the heat must be continued to soften it. An imperfect process is practiced, much after the manner of annealing glass, by simply placing the articles in the hottest end of a long furnace, and gradually drawing them to the cooler extremity. But a thorough process of annealing cast iron is by packing it in iron boxes, with ordinary quartz sand, in such a way that no one article can come in contact with another. The heat must not be sufficient to fuse the sand, nor even the sharp corners of the metal subjected to the annealing process.

The only known office of the sand is that of a vehicle whereby the heat is communicated to the iron, and to retain the same at an equitable temperature. Yet, when, in addition to softening and rendering malleable the iron, it is desired to effect certain changes in its texture and workable qualities, forge scales must be used instead of sand. Why so is among "The Mysteries of Metals" elsewhere alluded to in these columns. Forge scales are oxide of iron; but oxide of iron produced by "rust" will not answer the purpose any more than will sand.

"The explanation of the process of annealing depends upon the theory of heat which may be adopted. According to the immaterial theory, the particles of iron or glass are placed by the high temperatures of preparation in a peculiar condition, opposed to the attraction of cohesion; the cohesive force being restored by the modified application of heat in the annealing and tempering process."

It is sometimes claimed by manufacturers of annealed iron articles that they are tougher than those made of steel, and not as much affected by cold or jarring as that metal.

Malleable cast iron is confined to articles of only a moderate thickness. A piece of cast iron six in. in diameter could not be rendered malleable to the depth of over one and one-half in. at most; so that, practically, malleable cast iron is confined to a thickness of only about two in.

Time was when much more was claimed for the possibilities of malleable iron than is now admitted. Experience has proven that it trenches very little on the province of wrought iron; but that it has somewhat enlarged and considerably improved the uses of cast iron. It has been claimed that it could be forged and welded—even to steel. This may be in part true, but has never become economical. The possibilities of iron, in all of its forms, are still far from being fully known.

STRAIGHTENING SHAFTS.—A correspondent of the *Blacksmith and Wheelwright* asks how he can straighten a lathe-finished shaft, four inches in diameter and three ft. long, without damaging it by hammer blows. The editor of that journal answers as follows: "I would try this way: I would get a hard-wood plank or timber the length of my shaft, heat the shaft as hot as I could and not scale it; lay it on the piece of hard-wood plank or timber, crowning side up; take another smaller piece of hard wood and put it on the shaft, end up, and then let some one strike with the sledge hammer on the end of the small piece." Another correspondent of the same journal suggests the following method: "Let him get his bent four-inch shaft red hot, rest it horizontally level by pieces placed under each end, and apply water to the rounding side of it. This will contract that side. When the shaft is black hot about one inch deep, get it red hot again as before and repeat the operation, and so on. This is a wrinkle worth knowing, for it will straighten a shaft of any diameter without damaging it by blows."

NEW TELEPHONES.—A new acoustic telephone has been recently introduced by E. F. Edgecomb, of Mechanics Falls, Maine. When in connection with the compound wire, of three strands, which is also made by Mr. Edgecomb, conversation can be easily carried on. The ticking of a clock 20 ft. from the instrument can be heard at the other end of the wire, the diaphragm of the instrument is so sensitive. We also learn from a Boston journal that Prof. Dolbear, of Tuft's College, Medford, Mass., has invented a telephone that promises a great improvement over those in general use, and immunity from many of the chronic disorders of present systems.

Balancing Car Wheels.

In a recent issue of the *Railroad Gazette* attention is called to the importance of

Balancing Car Wheels,

And the following example is given to show the effect which follows if car wheels are out of balance: On the Philadelphia, Wilmington and Baltimore railroad, some time ago, one of the cars was a frequent subject of complaint on account of its irregular motion or "rough riding." The springs were examined, and, we believe, replaced with others; at any rate no fault could be found with them, and no improvement resulted in their change. Finally the wheels were taken out and new ones made by a different maker put under, when, to the surprise of everyone, the motion of the car from being very rough became very smooth. This led to an investigation by Mr. Lungren, the master car builder of that line, when it was discovered that the old wheels were very much out of balance, whereas the new ones were in an almost perfect state of equilibrium. This led him to make the following experiment.

He constructed a rectangular wooden frame large enough to take a pair of wheels inside of it. On each side he put a set-screw with a point like a lathe center, which was screwed into the center of an angle so that the latter could revolve freely. The pair of wheels and axle to be tested were placed in this frame and held by the set-screws described. The frame was then placed on rollers, about 2 or 2½ inches in diameter, which rested on a fixed frame. A rope was then wound around the axle, and a number of men then took hold of this and pulled it rapidly, as in spinning a top, so as to cause the wheels and axle to revolve rapidly. When the whole rope was thus unwound and the wheels were revolving with a speed of about 150 revolutions per minute, it was found that the degree of unbalancement—to coin a word—was indicated by the horizontal oscillations of the frame on the rollers. If the wheels are in equilibrium, the frame remains stationary when the former are revolving. There can be very little doubt that unbalanced wheels have very much to do with the smoothness of the motion of cars, and probably if car builders would repeat the experiments described above the fact would be impressed upon their minds as it could not be in any other way. It seems to be quite as important to test the equilibrium of cast iron wheels as it is to "pair" them, or measure their diameters, so as to get wheels of the same size in the same axle. The *Railroad Gazette* suggests that the experiment could be made more satisfactory if the movable frame, instead of resting horizontally on the rollers, was suspended vertically, so as to swing freely, like a pendulum. The rope could be carried over a pulley attached to the floor immediately under the wheels, and when the former was unwound the frame could swing with perfect freedom.

PHOTOGRAPHY IN MECHANICS.—Seal skin leather and leather manufactured from the boa and alligator, and goat skin is coming into considerable demand. The leather of the alligator presents a patchwork of raised squares; that of the boa, net work of diamonds, while that of goat skin presents corrugated lines crossing at acute angles. But this last surface is produced by a mechanical process called "pebbling." The leather from seal skin has a fine arabasque surface, very attractive and much employed in the manufacture of such fancy articles as pocket books, diaries, etc.; but as the genuine article is very expensive, the photograph has been called into use to assist in the manufacture of a similar material from ordinary leather. A photograph of the surface of the finished seal skin is taken upon a zinc plate, the plate submitted to etching acids, and the etchings deepened and dressed by the graver, when the plate and the imitation leather are passed between rolls and the imitation completed.

INDUSTRIAL INNICATIONS.—The arrival of gold in the United States from Europe is as great in proportion as is the arrival of immigrants from the same quarter. The United States have such vast resources of production that we are fast draining Europe of her surplus gold and of her best blood and muscle. We have cotton, which must be used to clothe toiling millions, and of late years we have been supplying food in immense quantities from the Western States and from the Pacific coast. Every year now but makes more manifest the grand destiny which is in store for the inhabitants of the most favored people in the world.

FIRE PROOF MATERIAL.—There is practically no such thing as a fire-proof building. Brick comes nearer to being a fire-proof material than any other substance. Iron is treacherous and almost worthless in many places where it is used. A good oak pillar is far better as a support in case of fire than iron. None of the building stone generally in use is of any value in case of severe fire, and granite is the worst, or least reliable.

TO REMOVE GEAR WHEELS.—To get a gear wheel off a shaft, upon which it has been shrunk, take it to the foundry and pour some melted iron around the hub, and it will heat and expand so quickly there will be no time for the shaft to get hot, and the gear will come off easily.

TELEPHONES.—It is stated that there are now over 200,000 telephones in use in this country. At the beginning of 1879 there were only 12,000; a year later, 50,000.

SCIENTIFIC PROGRESS.

The Mysteries of Metals.

Notwithstanding the wonderful progress that has been made during the last half century in regard to the constitution and working of the useful metals, there is yet a vast deal to be learned. The metals when pure are commonly supposed to be simple elements, yet there are some reasons for supposing that it may yet be proven that at least some of them are compounds. Even the great Faraday gave utterance to the thought that the dreams of the alchemists might yet be realized—that gold and other metals might be found to be compounds and that means might be devised whereby those compounds might be seperated, and afterwards so differently re-united that the baser metals might be converted into precious.

The changes which are wrought in iron and steel by converting, annealing and hardening processes are far from being understood by the most advanced metallurgists of the present day. The mysteries of hydrogen gas and its intimate relations with iron are as much a puzzle as they were 50 years ago, and the theory advanced by Graham that hydrogen itself is a metal is still maintained by many chemists.

It is only a few years since that absolutely pure iron became known to scientists; and it is now shown to be a metal almost as "unstable as water," and still found only in the laboratory as a great curiosity. What had previously been known as pure iron, was shown by Jacobi to be a compound of iron and hydrogen. He first separated the two so-called elements. During the process the iron increased in volume, changed from a dark to a silver white substance, very ductile and so soft as to be nearly as readily cut as lead. This experiment proved that hydrogen played an important part in hardening and tempering steel—as much so as carbon—but how or why none know to this day.

It is said that much more difficulty is found in rolling, and otherwise manipulating, gold in a factory where much electricty is generated by the action of machinery than in a room where no machinery is in operation, and where, consequently, frictional electricity is absent. The trouble is manifested in a disposition of the edges of the plates or thin bars to crack.

Many other peculiarities, already known, might be mentioned, and there is no doubt that closer observation will still largely increase the number of curious and as yet inexplicable phenomena connected with the working and general characteristics of the metals, both useful and precious.

SOUND FROM INTERMITTENT LIGHT.—Prof. Graham Bell and Mr. Sumner Tainter have continued their researches in this new field of inquiry, and, stimulated by the results obtained in Europe by Messrs. Rontgen, Tyndall, Mercadier and Preece. They have just submitted to the National Academy of Arts and Sciences a most interesting paper. They endeavor to sustain their original proposition that sonorousness, under the influence of intermittent light, is a property common to all matter, and have verified all the facts obtained independently in Europe, proving further that color has a marked influence on the effects. They have reproduced speech by the action of radient energy on lamp-black, using the powerful rays of the Washington sun. They have also replaced selenium in the photophone by a peculiar form of lamp-black cell. Moreover, they have introduced a new instrument called a "spectrophone," by which absorption spectra can be examined in the ultra-red region as well as throughout the whole spectrum by means of the ear, instead of by means of the eye, as in spectroscope. Although the ear cannot compete with the eye in the examination of the visible part of the spectrum, it becomes invaluable in examining the visible parts. The new instrument is a very promising addition to the physicist's laboratory.

ALCOHOL IN NATURE.—A paper on the presence of alcohol in the earth, in water and in the air, was recently read before the French Academy of Sciences. The author, M. Muntz, has developed the method depending as the change of alcohol into iodoform, so that one-millionth of alcohol in water can be detected. Alcohol is found in all natural waters except very pure spring water, and in greater quantity in snow. Rain water and the water of the Seine contain about one gramme per cubic metre. Alcohol, no doubt, also exists as vapor in the atmosphere. In soils, especially those which are very rich in organic matter, there is a considerable quantity. The wide diffusion of alcohol in nature is due to the destruction of organic matter by various agents of fermentation.

VIBRATIONS FROM MACHINERY.—The French society for the encouragement of national industry, which offered a prize of $400 for the invention of a means for deadening the shocks and vibrations to buildings caused by steam hammers and other heavy machinery, awarded one-fourth the amount for a device which consisted of introducing India rubber plates between the foundation of the machine and the floor.

Mind and Brain.

Aristotle regarded the heart as the seat of the "rational soul." The brain was looked upon by this prince of philosophers as a comparatively useless organ, whose only function was to cool the heart. According to the latest opinion of scientific authorities, the functions of the mind are performed in the rim of gray matter of which the outermost layer of the brain consists. There sensation ends and thought begins. There are the "end-stations" where the messages from the outside world are delivered, and whore volitions originate. But though anatomists have succeeded in following the trail thus far, and have, so to speak, cornered the mind and driven it into close quarters, they seem as far as ever from seeing the mind itself or from learning what it is.

Mental science is as distinct from physical science to-day as it ever was. The nerves are excited by motions. These motions are delivered to the brain, and there become transformed into things as different from the motions in which they originate as light is from darkness. The nerve of the eye when excited causes the sensation of light. This excitation may be produced by undulations of the luminiferous ether, by electricity, by congestion, or by a blow on the head; in every case the message along the nerve is, in the brain, translated into the sensation of light. The messages delivered by the nerve of the ear are translated into the sensation of sound. But these various sensations are altogether different from the physical excitements producing them. So also are the thoughts and volitions radically different from the sensations.

WHAT WE EAT.—Prof. Leidy, in a communication to the Philadelphia *Ledger* of April 9th, on the subject of "Trichinæ, Disease Germs," etc., gives, as appropriate to the subject, the following: "Some years ago, while in Charleston, S. C., at an entertainment, among other dishes served was one of the tail of a drum fish, in nicely browned slices. The writer was helped to a piece, said to be particularly gelatinous and delicate. These qualities seemed to depend on a jelly-like substance imbedded in the flesh. Curious to know its meaning, the next day a drum fish was procured from the market, and on dissection of the tail, it was found to be due to a huge parasitic worm, coiled into a mass nearly as large as a hen's egg." Prof. Leidy was the first to discover the trichinæ parasite in the hog, which discovery he announced in 1846. He discovered it in some meat upon a portion of which he had dined. His attention was attracted to a curious looking minute spot which he saw upon a slice of meat upon his plate. He laid the meat one side, and a microscopic examination led to the important discovery. The discovery of the parasite in man was made by the English surgeon, Hilton, in 1833, and the worm was subsequently named by Owen.

BURSTING POWER OF ICE.—Ed. Hagenbach experimented, during the past severe winter, upon the bursting force exerted in the expansion of water when freezing. Two interesting experiments were made with cast-iron hand grenades. The outer diameter was 5.9 inches, the inner diameter 5.04 inches. The shells were filled with water, closed with a screwed iron plug, and exposed to the cold. Both shells were broken, and a curved thread of ice was projected, by means of an ice column, from the upper surface. One of the plugs was evidently thrown out with great violence, and to such a distance that it could not be found. The curvature in that case was bent upward.

COLORING VEGETABLES GREEN.—M. Wurtz, the well-known French savant, describes a simple process for coloring vegetables green. It consists in the use of an excess of chlorphyl obtained from spinach, which holds in its cells a large amount of coloring matter. A watery solution of this, rendered alkaline by soda, is added to the boiling vegetable, which is slightly acidulated with hydrochloric acid. The chemical result is common salt and a deposit of coloring matter on the organic tissue. There cannot now be any possible temptation for the unwarrantable dyeing of preserved vegetables by salts of copper or the employment of adulterants for obtaining a vivid coloring.

ABSORPTION OF THE SUN'S RAYS BY THE CARBONIC ACID OF THE ATMOSPHERE.—H. Ernst Lecher, by means of observations with a thermo-electrical apparatus in connection with observations with a pyrheliometer, arrives at the conclusion that the amount of carbonic acid which has been proved to exist in the air is sufficient to cause the absorption which has generally been attributed to aqueous vapor alone. He believes also that his method is better adapted for obtaining the amount of carbonic acid in different layers of the atmosphere than the chemical methods hitherto adapted. — *Annal. der Phys. u. Chem.*

MEASURING STELLAR LIGHT.—An apparatus has been described by M. Janssen for measuring the intensity of the light received by us from the stars. It is, of course, necessary for comparative purposes that the photographs of different stars should be taken under identical conditions. M. Janssen hopes to be able shortly to obtain by this method additional data for ascertaining the relative dimensions and distances of the stars, and also additional evidence concerning the phenomena which take place in them.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

PHIL SHERIDAN CON. M. CO.—June 29. Capital, $10,000,000. Directors—John A. Robinson, G. W. Bennett, Arthur F. Carmody, Cortlaud G. Walker, John F. Hennessey.

HOWARD SPRINGS IMPROVEMENT.—The proprietress, Mrs. Carrie Hiesch, is having a large dwelling house completed, near the hotel, for the accommodation of the increasing patronage of these favorably-known aprings, near Lower Lake.

THE accommodations at Siegler aprings are to be increaed by the addition of a commodious office and reading saloon.

Lo! the poor Indians now make roads for tbe wheels of progress, in Lake county.

MINING SHAREHOLDERS' DIRECTORY.

Mining Share Market.

There is nothing specially now to report of the mining share market, other than our tables give. On the Comstock, on Wednesday, the hydraulic pumps started up, and were working well and smoothly at last accounts. The general feeling is that these pumps will now give no more trouble. They have been strengthened in every part where subjected to extra strain, and more air chambers have been added to reduce the shock occasioned by the closing of valves when the pumps are in motion. Nothing has been left undone that human foresight has been ahle to provide against. As yet there is no change of material in the Sierra Nevada crosscuts that is worthy of note.

It will be interesting to our mining stock friends to learn who are the new officers of the New York Mining Stock Exchange. They are as follows: President, S. V. White; Treasurer, John Stanton, Jr.; Chairman, A. W. Peters; Secretary, E. A. Wood; and Assistant-Secretary, R. H. Gallagher, Jr. Following is a full list of the governing committee, and the term for which each member is to serve: To serve one year, R. K. Cook, E. L. Clarkson, Geo. Phipps, H. Dunham, R. Weston, C. H. Badeau, H. S. Stanton, Jno. F. Scott, and G. W. Hoagland. To serve two years: P. K. Dickinson, G. B. Satterlee, J. A. McPherson, R. M. Shaw, R. P. Loonsherry, Louis Haight, W. W. Hanley, A. L. Seton, and P. P. Rohinson. To serve three yeare: R. McJimsey, Brayton Ives, J. H. Tucker, Geo. F. Mann, E. J. Munroe, E. P. Mitchell, C. F. Wood, W. C. Budd, and W. E. Cox. E. J. Mann was elected trustee of the gratuity fund, to serve five years.

MINERS' UNION.—The following officers have been elected hy the Gold Hill Miners' Union to serve the ensuing six months: President, E. O. Leermo; Vice-President, Thomas Fraser; Recording Secretary, J. D. Campbell (re-elected); Financial Secretary, Thomas Burke (re-elected); Treasurer, J. R. Connors (re-elected); Conductor, M. Murphy (re-elected); Warden, John Sullivan; Finance Committee, J. A. Judeska, M. Flannery, M. Buckley; Trustees, P. H. Gillooly (re-elected), H. W. Stokes (re-elected), T. Stephens, Edward Dougherty and Edmund Wolsh (re-elected).

THE Sierra Nevada mine produced 300 tons ore laet week, assaying $22 per ton. No dividends in that.

A STEAMER is building at Linkville for Big Klamath lake. It will he a screw propeller of 35-horse power, 60 ft. long and 12 ft. beam.

Mechanics' Fair.

On Tuesday evening another meeting of the Board of Managers of the coming Mecbanics' fair was held, and from the reports of the various committees a most satisfactory showing for the success of the exhihition was made. The announcement that $1,000 would be paid for the first successful trip of a flying-machine around the pavilion, carrying a man, has had the effect of hringing to light a numher of wonderful inventions, and an eminent professor of aeronautics has exhihited a perfect model, from whicb a large machine will at once be constructed. The identifying season ticket used this year will be desigued hy A. R. Wells, a member of the Board, and used so successfully at previons fairs. The prices of admission this year will be: Double season, $5; single season, $3; single admission, 50 cents. The display of agricultural and mining machinery in operation, combining the latest improvements in those two important elements of our prosperity, will be a special feature, for which a large and inclosed space has heen set apart. Another new triumph of California, from invention and manufacture, will he shown for the first time hy an improved steam fire-engine and a rotary engine of novel constrnction. We have been told of a number of mining appliances which are to be exhihited, more especially in the line of ore crushers and concentratore. It is to he hoped that our foundrymen will show enterprise enough to exbihit artioles of whicb they make a specialty. All these things go to make up a successful exhihition, and to attract the attention of the puhlic to our bome resources and industries.

Bullion Shipments.

We quote shipments since our last, and shall he pleased to receive further reports:

Germania, June 23d, $2,060; Hanauer, 23d, $1,580; Frisco, 23d, $4,584; Bullionville, 23d, $1,957; Ontario, 23d, $9,034; Horn Silver, 21st, $2,500; Ontario, 21et, $18,120; Hanauer, 21st, $1,550; Germania, 21st, $1,850; Christy, 22d, $1,776; Germania, 22d, $1,050; Hanauer, 22d, $5,280; Frisco, 22d, $4,222; Bullionville, 22d, $7,337; Ontario, 22d, $9,255; Horn Silver, 24th, $12,500; Frisco, 24th, $2,293; Ontario, 23d, $24,995; Germania, 24th, $2,900; Mayflower, 24th, $5,625; Germania, 24th, $1,990; Hanauer, 24th, $1,600; Christy, 24th, $1,817; Indian Queen, 21st, $4,195.58; Northern Belle, 22d, $6,852.22; Mt. Diahlo, 24th, $7,592.80; Western, 25th, $10,601.50; Bodie Con., 27th, $7,586; Standard Con., 27th, $39,298.70; Northern Belle, 27tb, $7,674.61.

MINING SUMMARY.

The following is mostly condensed from journals puhlished in tbe interior, in proximity to tbe mines mentioned.

CALIFORNIA.

AMADOR.

AMADOR GRAVEL M. Co.—Amador *Ledger*, June 24: The property of this company, which bas heen tied up by attachment suits for two months past, in the interest of the employees and other creditors, was released this week, and mining operations are to be renewed at an early date. I. Bluxome, Supt. of the company, came up Friday evening, and settled all the outetanding indehtedness, and the suite have been withdrawn.

MISCELLANEOUS.—The Pacific Gravel M. Co. is the name of an incorporated company recently organized to work a gravel deposit situated one mile north of Volcano. A strike of fine-looking rock is reported at the Fogus mine, Volcano, at the 200 level running north. The mill was started up this week. The small mill lately huilt by R. Stewart on the Amador side of the Mokelumne river, uearly opposite West Point, is expected to commence operations next week. The Volcano Gold Gravel M. Co. keeps a few hands employed in shovelling gravel into sluice-boxes, and running a small head of water. This plan will likely be continued tbrough the summer months while the scarcity of water lasts. It is thought tbat the yield from this process will he fully as satisfactory as the first clean-up with a full stream of water.

JACKSON.—Amador *Sentinel*, June 22: The mining interest has at all times been large, though it may not be in as flourishing a condition to-day as in times past. The Zeile mine is the principal one in operation. It employs about 100 men, has a fine hoisting works, a 40-stamp mill which is the equal of any in the State, and a chlorination works. We understand that 100 tons or more are crusbed per day, the rock paying fairly. The Kennedy mine, on the north side of town, is again in operation, under the superintendency of P. Reichling. The character of the rock now being taken out ie good. Considerable mining, hoth quartz and placer, is being carried on between here and tbe Mokelumne river. The veins are mostly small, hut of exceeding richness. Morgan & Co. and Nash & Co, are operating quite extensively in this district. L. N. Dewitt is also largely operating in this district, with encouraging results. The great bane of mining around Jackson, and the same may be said of other towns of the county, has been in the operations of irresponsible parties, who, hsving honded a mine on the strength of "big talk," run thousands of dollars in debt and then jump the town. Mining has so far proved the ruin of all small capitalists who have attempted to fly before their wings were festhered.

DOWNS.—R. C. Downs stated briefly that prospects never looked any brigbter. "I have," he said, "made the first run of rock from the 400 level, and find tbo results exceeingly gratifying. In fact richer than the 300 level. I employ at present between 20 and 30 men and keep 20 stamps going constantly. The length of the vein is 285 ft, with an average width of 4 ft." "Do you intend to develop it further?" "Certainly; I intend sinking a double-compartment shaft next fall and get heavy machinory.'

BUTTE.

SOLD.—Croville *Mercury*, June 24: The Loring & Leavitt claim, near Elizsbettbown, was sold last week to E. A. Corbin and party, of Philadelphia. We understand that the price was $50,000. If that amount was peld, tbe Eastern gentlemen have got their bands full.

A GENTLEMAN who has purchased a one-half interest in the Hyatt & Hughes claim will put it down to bedrock, when rich developments will probably be made. All the drift mines at Spanish peak are working in rich gravel. The Chinese claims are paying the best. All the hydraulic mines there that have water are running on full time and expect to make a big clean-up. The Monte Christo gravel mine is shut down at present. Mr. Murpby, the Supt., is absent, and the acting Supt. refuses to allow anyone to go into the mine. The great secrecy about this mine strongly suggests that there is a cat in the meal, and that something is wrong. There is probably going to be another deal in Chicago or New York soon. Chas. Cotterell, who has been running a drift under Mt. Ararat, Plumas county, says he has struck very good pay dirt. The drift gravel claims owned by Thos. Johnson and others at Buckeye, has been bonded to San Francisco parties. Terms, private. The Miocene Co. have finished cleaning up, and the Supt., Mr. Harris, informs us that it paid about as well as the first. Tuesday the men placed the riffles back into the flume, put the claim in order, and that night were discharged. There is now about 200 inches of water running through the ditch and flumes. The big tunnel in the Spring Valley mine at Cherokee is now in 400 ft. John Hyde and John Martin, of Bidwell's bar, are putting one of Martin's elevators in on Stringtown bar, and will probably be at work next week.

CALAVERAS.

INCREASING WATER SUPPLY.—Calaveras *Chronicle*, June 25: We understand tbat the owners of the North Hill mine, near Milton, are so much pleased with the workings of their new ditch recently completed, and the present outlook of their claim, that they are now having plans and estimates prepared by A. B. Beauvais for increasing their water supply by raising the dam at Salt Spring valley reservoir.

UPPER COUNTRY MINING NOTE.—Champion mine running 700 level on rich rock. Mill running steadily night and day. Rose & Jenkins are sinking the main shaft in the Henry mine under good prospects. Present depth, 100 ft. The lode shows plenty of gold to the naked eye. Furgeson & Co have commenced to sink the shaft on the Colorado mine another 100 ft as a prospect. A compressed air drill is being used in the mine. The Lone Star mine is being worked by its owners, Messrs. Reed & Hillery. Congdon & Reed are still sinking the main shaft of the Tom Payne mine, with rich quartz in the bottom of the shaft. Cross switch & Co. have crushed 10 tons of quartz from tbe Scorpion mine, which averaged $65 per ton. Staeger & Co. have struck rich rock in the Dunna mine.

WEST POINT.—Our mines continue to bold about the same. All of the present companies now working have good quartz and plenty of it. I don't hear of any complaints, on the contrary all of our Supts. are highly pleased with their prospects, and are confident tbat the West Point mining district is as yet in its infancy. Under the head of new strikes we have two, Mr. C. Reitz and Mr. L. Morse, both having found new ledges a short distance from town which prospect well. The latest feature in tbis district is the discovery of an excellent granite rock. The Colorado mine has the honor of its first use in West Point, and before long other mines of note will follow in its wake. The river beds are as usual, annually turned over by John Chinaman in search of gold, the exact proceeds of which would be hard to determine.

BRYAN MINE.—Proceeding from the Boston mine in a northerly direction at a distance of a half mile lies the Bryan, one of the best prospects of the country. This ledge was discovered by the present Supt. some time ago, but there had not been work done on it to amount to anything until recently. The work done consists of a shaft now down about 40 ft, showing a ledge 3 ft wide and rich. A drift at the bottom running west shows rock calculated to pay $75 per ton. A tunnel is being run to tap the ore body at a depth of 150 ft. Grading for a mill was commenced on Friday last, and the machinery for running 20 stamps will leave San Francisco as soon as it is necessary. A splendid two-story building has been erected on the works, to be used as an office for the Supt., clerk and foreman of the mine.

EL DORADO.

WATER.—Georgetown *Gazette*, June 24: T. F. Lewis, of Spanisb Flat, has been for sometime trying to bring about a concert of action among the miners of that camp for bringing water upon the ridge there to work a large

extent of seam and gravel ground lying above the ditch and known to contain gold in paying quantities. It will require about 9,000 ft of 22-inch pipe, besides some ditching, to supply that section with water should it prove anything like what is anticipated. The Co. propose that those interested put through a 9-inch second-hand pipe of their own, as a temporary arrangement, when water will be furnished free to test the value of the leading claims, after which, if satisfactory, the company agree to put through a large pipe and supply all the mines with water at the usual rates. The ridge in question is favorably situated in a good belt, and it is not extravagant to presume that the working of that ridge would result in the opening of a mine equal to the Nagler, Crane's Gulch, Parsons or Beattie mines. It is high time our people were laying asi de their indifference and personal disagreements in the camps all along the line, and possessing themselves with a spirit of enterprise to develop our hidden wealth, the out-croppings of which are plainly visible on all sides. We can announce that the Eureka mine of this place is a success. The developments up to this writing give us every assurance that the Eureka is one of the best quartz mines in the State. The clean-up of 50 tons of rock crushed at the Greenwood mill is being made at this writing, and experienced men who have been inspecting the crushing daily are united in their enthusiasm of favorable results. About 30 tons of the rock was from the ledge in the second level, taken from the north drift out of the lode where it was 25 or 30 ft wide, and considered to be the lowest grade ore in the mine, and tha remaining 20 tons was taken just as it laid from the dump. The value of tha sulphurata has already been determined to Mr. Baird's satisfaction, which is about $30 per ton, and the percentage of sulphurets is large. Rock now being taken from out of the mine frequently shows free gold.

GOPHER AND BOWLDER.—Mountain *Democrat*, June 25: Preparations are active for operations on a large scale at the Gopher and Bowlder mines, Kelsey District, during the present season. In addition to the work of erecting the mill, explorations of the ledge are in progress from several different points. A tunnel will be run to a point at the foot of the hill, due east of the shaft on the Gopher, from which 500 tons were recently taken, and crushed at the Chapparal mill with satisfactory results. It is safe to calculate that the capacity of the mill will be rapidly increased, and that before the first of January it will be running 40 stamps night and day on Gopher and Bowlder ore.

MARIPOSA.

MINES.—Mariposa *Gazette*, June 25: Some two miles above Hite's Cove, on the north bank of the river, is what is called Simm's Cave. In the neighborhood of a mile north of Simm's Cove, upon the mountain, is the El Carmin mine. This cove, which is situated opposite where Devil's gulch empties into the river, will probably be the spot upon which the company will construct their principal works for crushing rock by water-power taken from the river above, by means of a flume or ditch, and terminating at this point. Mr. Lyall says as soon as preliminaries can be arranged they expect to commence a tunnel at the base of the mountain, bordering upon the river, and run for the El Carmin mine, a distance of about 3,000 ft. In the course of the tunnel as contemplated, the chances of cutting blind lodes is exceedingly favorable. The Hite mine, which is at present the "astonisher" of that section and of the county generally, will in due course of time be equaled in importance by what is yet undeveloped in this gold-producing mountain.

THE FERGUSON mine and works are in running order again. Owing to a breakage of some sort, work was at a stand-still for a few days, a short time back.

NEVADA.

THE MURCHIE.—*Transcript*, June 22: The new 10-stamp mill of the Murchie will probably be started up to-morrow, as the finishing touches are now being put upon it. The mine is in a first-class condition, and under Supt. Schuyler's efficient management is being conducted in a manner that will secure the best possible results to the stockholders.

THE CHAMPION MINE.—*Free Lance*, June 20: The Champion mine is working at Nevada City, on the north side of Deer creek. The ground of this company is located between the Wyoming ground and the Merrificld mine. The Champion's tunnel is now in 1,700 ft, and last Wednesday the miners began to crosscut. It is positively known that the crosscutting will strike three or four large and rich ledges within a very few days. Work in running the tunnel has been going on for the past four years.

THE LOSS ESTIMATED.—Nevada *Transcript*, June 24: The North Bloomfield, the Milton and the Blue Tent hydraulic mines are all at a stand-still on account of Judge Keyser's injunction, produce altogether about $3,000 worth of gold bullion a day when in operation. Their loss in the matter of water, which is now going to waste, is not less than $1,000 a day. Supposing that only 60 days elapses from the time they shut down till they can start up again, what an enormous sacrifice results, to say nothing of hundreds of men with large families to support being idle all that time! And yet these are only 3 mines out of a dozen equally productive ones, and as many more small ones, that are similarly affected.

PLACER.

THE GLD SALSIG.—Placer *Herald*, June 25: Some time ago Adam Holden secured a lease of the old Salsig quartz mine, located a short distance north of town, and for several weeks he has been engaged in sinking a new shaft 150 ft west of the old works. He is down about 25 ft, and from top to bottom he has found the rock of an encouraging character. He showed us a large piece of ore the other day that fairly glittered with gold, and says that all the rock he has taken out, whether it shows free gold or not, prospects rich.

MIDDLE FORK.—There is considerable mining going on on the Middle Fork, and on the north and south branches of it. On the South Fork, at Alabama bar, Hazlett & Co. have a large force—all Chinese. At Rector's bar Kasloski & Co have a gang of Mongolians; Wilson, on Horseshoe, is running a crowd of the pests; Stuart, at Stumps bar, ditto. The Mitchell mine, on El Dorado canyon, is paying well. He has a large force of white men at work.

PLUMAS.

PAYING LIVELY.—Plumas *National*, June 24: The Loring & Leavitt claims at Elizabethtown, recently purchased by Corbin, Manson & Co., are paying at a rate that is astonishing. We give a few figures to show what is being done there, with only a few men at work—probably not more than four picks running at once. For the week ending on the 17th inst., they cleaned up about $1,600. From the 18th to the 21st, $1,200, and since that time they have been making big pay but we have no figures. For the week ending the 10th, they cleaned up $2,100, or a few dollars over that amount.

NELSON POINT.—In company with some friends we took a look through the Willow ranch country on Wednesday, and found things looking prosperous. Metcalf & Co., whose hydraulic claims are situated directly opposite Pauley's hotel, have had a big run of water this spring, and have improved the opportunity, too. They have piped off a large lot of gravel, and are now cleaning up, with good results. On Wednesday one of the workmen picked up a nugget weighing some $15, showing that the gold is coarse, and the evidences are plenty that they will make a splendid season's work. They have acres of good hydraulic ground in front of them—more than they can wash away in years to come. The Blue Gravel mine is still idle, but there is some reason to believe that active operations will commence there before the season is over. Nelson Point and vicinity is one of the old-time rich spots of earth.

A GRAND MINING COUNTY.—Plumas *National*, June 24: Every day shows our county in a better light as a mining country. Prospecting is going on lively in every direction, and the work is bowe more clearly, every day, that Plumas has undeveloped riches which will put her in the front before long, and make her noted all over the world as a mining center. A large scope of undeveloped mineral land lies to the south of Meadow Valley, and several locations have been made there, but, as yet, but little work has been done toward opening the immense body of gold-bearing gravel which the mountain contains. Spring Hill, owned by Bone & Phelps, is the only place where work has been done tending to show the wealth of the lead, and at this company's claims the showing, for the amount of work done, is very flattering, the gravel being beautiful and rich, and the small opening proving that it is extensive. The tunnel run by the company is some hundred ft into the mountain, and a raise from it of some 75 ft put it into gravel. The rim shows plainly at this point, and the upper drift followed it for a hundred ft more when it pitched back rapidly, and work was stopped. The gravel on this rim is rich. Lying to the east and north of Spring Hill are several locations which promise to be very valuable.

SAN BERNARDINO.

LAWSUIT.—San Bernardino *Index*, June 24: R. J. Whitton, the mining expert who has been in San Bernardino for several weeks past, has lately had assays made at different depths on the Lawshe mine, at Pinacarte. There are two 50 ft inclines, one drift 32 ft south, and another 130 ft north. A sample of 13 lbs. of ore was taken from each 10 ft of this distance, giving an average of $81.86 to the ton. A more complete test of the real richness of the mine could not have been made, and it is far above what the owners anticipated. There were shipped from here yesterday, per Wells, Fargo & Co.'s express, four bars, containing gold and silver. They were from the Gunsight mine, Resting springs, and were consigned to a firm in San Francisco. The total value of the four bars was about $7,000. The Pinacarte mill is shut down at present, awaiting some additional machinery. A short run was made last week of 5 tons, yielding $151 50.

SIERRA.

THE RAINBOW BONANZA.—Nevada *Transcript*, June 22: The Rainbow mine at Chips flat, Sierra county, made famous this spring by one of the richest deposits of gold ore being found therein that there is any record of in the history of California, continues to pay as well as during the early stages of the development. The remarkable chute is not as conveniently worked from the present shaft as could be wished, and a new one situated further to the north will shortly be put down. In the meantime a cage has been sent up to be used in the place of the bucket which has formerly done service in the old shaft. To Supt. J. O. Groves' intelligent management of the Rainbow is due much of that claim's phenomenal success.

TRINITY.

A WIDE CHANNEL.—Trinity *Journal*, June 24: From Mr. P. M. Paulsen, who visited the Oregon Gulch Mountain mine of the Trinity gold mining company this week, we learn that the mine is looking well and is now opened in splendid shape. Mr. Paulsen measured the channel on the bottom and found it to be 207 ft in width, with plenty of rich gravel. With anything like a favorable water season next year, this mine will give out a large yield.

NEW RIVER.—The derrick lately put up by Boles & Co. is doing good work; it easily raises and swings out of the way bowlders that weigh as much as three tons. This is a step in the right direction, and I wonder at people wasting so much labor breaking rocks when $100 invested in a derrick would save all that labor. The Portuguese company made a run of eight days through the cut they have been blasting last winter, and they cleared 13 ozs. from the ground sluice. This is from the gravel only, as they leave the bedrock till summer when water is too low to ground sluice. From a run of 20 days they took 27 ozs., or nearly one and one-half ozs. per day from another cut; this also without touching the bedrock. This is conceded to be doing well. Work is stopped on Slide Creek and Eagle Creek claims for want of water. Messrs. Sherwood and Mills are working away at the ledge at the head of Pony creek. Healy, the discoverer of another ledge on Eagle creek, is running a tunnel to strike his ledge 20 or 30 ft below the surface. Carson and Donald on North Fork are reported as doing well. On Virgin creek there are six or seven men working in the bed of the stream. The river is quite low and wingdams are now in order, with prospects of doing well.

NEVADA.

WASHOE DISTRICT.

MEXICAN.—Virginia *Enterprise*, June 26: On the 2500 level the joint Union Consolidated winze has been sunk and timbered 10 ft, and the joint Ophir east winze 11 ft. At the 2400 level of this winze a tank station is being cut out. On the 2700 level the east drill hole has been extended 105 ft.

CON. VIRGINIA.—On the 2300 level the joint Con. Virginia and Best and Belcher east drift has been advanced 14 ft. On the 2500 level we are cutting out a station for a winze joint with the California Co.

SIERRA NEVADA.—On the 2500 level the joint Sierra Nevada and Union Con. winze has been sunk and timbered 12 ft. During the week 310 tons of ore, assaying $22 per ton, have been extracted on the 2400 level.

CALIFORNIA.—During the week we have extracted and sent to the mills 69 tons and 600 pounds of ore, taken from the 2000 level. On the 2500 level we are cutting out a station for the joint California and Con. Virginia winze.

OPHIR.—On the 2500 level the joint California winze has been sunk and timbered 14 ft, and the joint Mexican east winze has been sunk and timbered 11 ft.

SIERRA—DEVIL'S GATE.—The machinery has recently been overhauled and is in good working order. Work has been resumed in the south drift, where we have a very promising vein from two to three ft wide, carrying streaks of rich ore, assaying all the way from $70 to $400 to the ton.

ALTA.—Since the last report we have sunk and timbered the shaft 27 ft; total depth, 2,004 ft. The bottom of the shaft is in a mass of barren quartz, which does not blast very well. No change in other respects.

UNION CON.—On the 2500 level the joint Mexican winze has been sunk and timbered 10 ft, and the joint Sierra Nevada winze 12 ft.

UTAH.—During the past week the incline has been sunk and timbered 17 ft. The north drift on the 400 level has been extended 45 ft.

UNION SHAFT.—Are cutting out the station at the 2700 level and easing timbers at the 1000, 2200, 2400 and 2500 levels.

SUTRO TUNNEL.—The small sub-drain, leading from the Combination connection to the intersection of the south lateral, has been extended 50 ft. The main tunnel drain boxes are being braced down to prevent the water running in the sub-drain from displacing them. The other shift (removed from the main tunnel), have commenced securing the ground between the Hale and Norcross and Julia connections. The south header is now 164 ft from the south line of the Yellow Jacket claim. The flow of water from the tunnel is equal to 4,476,400 gallons for 24 hours.

DUN GLEN DISTRICT.

HOISTING WORKS.—*Silver State*, June 22: Vance M. Nelson arrived from Dun Glen last evening, on his way to Spring city, to attend to his mining interests. He says hoisting works are to be erected on the Lang-Syne mine, and it is supposed that Dr. Loomis has gone to San Francisco to purchase the machinery.

EUREKA DISTRICT.

WALES CON.—Eureka *Sentinel*, June 22: From the Supt. we learn that the Wales Con Co. owns 11 claims. The total length of the mine, embracing the entire group of locations, is about 4,200 ft., situated between the Richmond and Albion end lines and the Silver Lick Con. Co.'s property. The improvements on the Wales Con. (erected since the fire six months ago, which reduced everything to ashes), include the shaft and engine house (over 50 ft long) and several outhouses. The new steam hoisting works, which have been running smoothly for some weeks past, include a double-acting and double-cylinder sinking-station engine, with double reels, and having a capacity to hoist 2,000 ft, perpendicular depth. During the last three years a great amount of work has been done on the property.

LEWIS DISTRICT.

THE CAMP.—Cor. Eureka *Sentinel*, June 25: Lewis, Lander county, is a mining town of about 800 or 900 inhabitants. There are two 10-stamp mills in operation at present, and one 40-stamp mill under construction, which will be finished and running by Aug. 1st. There are 4 or 5 saloons and 2 hotels. The principal mines in the district are the Star & Grove, Betty O'Neil and the Morgan, which employ some 200 men. The Morgan mine has recently been sold to a New York company for $20,000. Miners' wages are $4 per day; mill men get from $3 to $5 per day; common laborers, $3. There is considerable lot jumping going on. Lots sell from $200 to $1,500 each. Lumber is scarce, owing to the railroad not being able to haul it.

RAILROAD DISTRICT.

COPPER.—*Times-Review*, June 22: The sale made to Wilde & Co is being utilized, and the mine is producing about eight tons of copper bullion per day. This is the Blue Bell mine. The same firm of Wilde & Co. have also purchased the Bald Mountain Chief, and as soon as the tunnel is completed they will take out ore enough to keep the smelter steadily at work. Mr. Hatch has bought some fine galena prospects at Railroad district. The ore assays from $50 to $110 per ton, and carrying the required fluxing elements. The ores can be sold for two-thirds of their assay value at Eureka, and several of similarly reported mines are about to extract ores and sell them in the Eureka market. On the whole the camp has a fine outlook.

SAN JUAN DISTRICT.

WORK.—Reese River *Reveille*, June 20: A very considerable amount of work is quietly going on in this and surrounding mining districts. Tolyabe range of mountains, especially, is being looked after by the knowing ones—those who are familiar with the country. We learn that a very fine prospect has been encountered in the Tiger mine, located in San Juan canyon, somewhere about 40 miles up Reese river from Austin, and in the Tolyabe range. The character of the ore is said to be carbonate or galena. Those who have seen the mine speak enthusiastically of the prospect in sight. There is doubtless a good mineral belt in the region of the canyon referred to.

WALKER LAKE DISTRICT.

MOUNT GRANT.—Carson *Times*, June 21: Matters at Mount Grant, 7½ miles from Hawthorne, would seem to be in a flourishing condition. Those interested in that capital of Walker Lake district will be pleased to know that an 8-stamp quartz mill is on its way from San Francisco, and will soon be at work at Mount Grant. The mill will begin crushing $200 ore. They have plenty of wood and water near the mine, and expect to be able to work the rock for $5 per ton. It is almost certain that three or four good mines in that vicinity will be disposed of within a few weeks in San Francisco, so that work may soon be begun on an extensive scale. Mount Grant promises soon to be a lively mining camp. It is close to the line of the Carson and Colorad railroad; within a few hours' ride of Carson and Bodie; the climate is fine, and everything seems favorable for an extensive prosecution of mining enterprises there.

ARIZONA.

KLARA CAMP, SILVER DISTRICT.—Cor. *Arizona Journal*, June 23: The silent mine, in the contract drift of 100 ft from the 90-ft level of the vertical shaft, is showing excellently, and the work being pushed rapidly. The hoisting works are in successful operation.

THE Pacific mine is being investigated by the contract shaft of 150 ft, and the result is the augmenting of the sacked pile of high-grade carbonate ore on the dump. Geo. W. Taylor, a Nevada mining superintendent of enviable reputation, has arrived, and will take charge as superintendent of the workings of the Boston Co.'s property (late Hughes group, and $175,000 purchase).

THE Silver Glance tunnel is on the wall of their ledge, work progressing favorably in the shaft, and preparations under way for deep mining.

THE Klara mine continues in favorable ore-bearing, live quartz. The crosscut is now in 20 ft of solid ledge matter.

BISBEE DISTRICT.—Cor. *Arizona Journal*, June 24: From present appearances our camp is soon about to enjoy another success in the way of a bullion producer. We have made the inquiry in regard to what has made the change, and find that all the claims that work is being done on are looking exceedingly well. New and rich strikes are being made every day, and the future of the camp has never looked brighter than it does to-day. On the northern copper belt the Copper Queen is hard at work, unearthing the vast body of ore and turning it into bullion and shipping it away to be used to the advantage of man and his welfare. There are now working at this mine and furnace over 00 men. In the mine the west drift of the second level is showing up well, the ore being rich in red oxides. The south drift on the 3d level has reached a distance of 47 ft, all in ore. They have started another drift on the east on the same level; it is all in ore. The mine never looked better than it does to-day. They are now grading for a place to move their crusher nearer to the mine. They have worked this month, so far, 592 tons of ore, yielding 116 tons of bullion; on the 18th they made their largest run, having worked within 20 lbs of 40 tons of ore.

SINCE my last letter they have made a very important strike on the Neptune mine, showing that the assertion that there is but one mine in this camp is absurd. They are now working a cut 70 ft in length, showing a ledge of high-grade ore, assays averaging 40% copper. In this cut they have a 10-ft shaft, all in ore, and in no place is the ledge less than 7½ ft, and from that on up to 10 ft in width. The smelter and machinery are now on the road from San Francisco, having been shipped the early part of last week.

THE Keystone mine joins the Neptune on the south. There is now a shaft 38 ft in depth; the ledge from top down being copper ore, assaying an average of 22%.

THE Black Prince lies southwest of the Twilight. It has a 10-ft shaft, showing well. Work is being pushed along by the owners.

CHLORIDE KING.—*Pinal Drill*, June 25: The Chloride King is in Rogers district, Pinal county. It belongs to Messrs. Pickering & Benson, was located in July, 1880. The lowest sample assay taken from the 18-ft shaft was $346. Where that was taken the pay streak runs up to 18 inches in width.

THE EASTLAND M. Co.'s PROGRESS.—Mr. McGowan, under whose immediate charge the work on the Tilden mine is done, reports that they have struck a 10-inch streak of ore in the shaft at a depth of 140 ft that assays 700 ounces. It is black sulpburet ore containing native silver. This pay streak is in white porphyry encased in black syenite, and is the third strata passed in the shaft of that character of ore.

THE WINDSOR CON. Co.—Nearly all the tailings at the Windsor Co.'s mill, Pinal, have been worked, and produced over $10,000 in bullion. When the new roaster is in place, they will commence with a fresh supply of chemicals on $200 ore which they are bringing from their Mount View mine.

SOUTH PIONEER.—*Silver Belt*, June 18: The South Pioneer has stepped to the front in public estimation, and is prospectively regarded as without a peer in Arizona, except the King, which is conceded to be the "boss mine" of North America. The now famous Mack Morris, when no more developed than the South Pioneer is at present, is dwarfed by a comparison. Mack Morris, one of the most intelligent prospectors of the Pacific coast, an original locator and half owner of the South Pioneer, repeatedly expressed his regret to the writer that pressing necessity forced him to part with his interest. We rejoice that all difficulties with the Scotts' and South Pioneer Co. have been amicably settled.

COLORADO.

LOOKING UP.—Bowlder *News and Courier*, June 19: Mining matters are now looking up very materially; new claims are daily being located, and old abandoned ones, and those which for want of funds have been lying idle, are being worked once more. The Golden Age mine is again developing into a great producer, having uncovered in a crosscut what all parties agree to be a marvelous body of free gold. The work of one man for one month realized $1,500. Since writing the above, we learn that from one sack of this ore 29 ozs. of gold were extracted, or $580 from about 70 lbs. of ore. Capt. Coan and J. L. Haff are putting in new sluice boxes, and getting ready to operate their placer claim in South Bowlder canyon. In a few hours Mr. Haff says he panned $20 in gold dust from these diggings recently. The Van Vleet mill at Balarat will this week ship 5 tons of concentrates of Smuggler ore. C. Frantz, forsman of the last-named mine, says that a foot of rich ore has been uncovered in the lower workings. Mr. Gill, Pres. of the Buena, is at Jamestown, and says that that property will shortly be the scene of life and activity. A. J. McCorkle has sold to Boyd, Cheney & Co. an interest in the Newcomb mine, situated near Gold lake, above the John Jay.

IDAHO.

CUSTER.—*Idaho Herald*, June 18: The Custer mill is turning out more bullion than any other mill on the continent of its size. Owing to trouble from surface water operations in the Montana mine will be suspended for a short time.

BAY HORSE.—The smelter is running right along, reducing ore from the Hood and Sky Lark, owned by the company. Large quantities of fine bullion is being turned out. The Ram's Horn is working about 00 men, and the mine is looking better than ever before. Considerable ore is being extracted from the Silver Wing, and there is a large quantity in sight. A large force of men has been put to work on the Post Boy, from which mine a good road has just been completed to the smelter. A large force is also at work on the Beardsley, and ore is being shipped daily to the smelter for reduction.

BOISE COUNTY.—The large chimney known to exist in the Wolverine has been struck. Much richer ore than was expected has been found. The Elmira Co. will put on a large force in 2 weeks. The placer mining season is about over in the basin. The Sub Rosa, in Gambrinus district, is looking first-rate, also the Forest King.

FOREST KING.—Cor Yankee Fork *Herald*, June 18: This mine, in Gambrinus district, is showing up finely, and the owners are very much elated over their success. The rock is fairly speckled with gold. Mr. Lockwood is busy putting up his 1-stamp mill on the Golden Fleece mine, near Centerville. The ledge is a good one. His operations are watched anxiously by many miners, and if the new mill does as represented many more of them will be put up in Boise county. The Canyon creek mines are showing up better than ever, and a good deal of rich ore is being taken out. The richest strike ever made in Boise county was made a few days ago, at Banner, by Jim Irwin. The new discovery is situated about 30 ft north of the Panamint, owned by Irwin & Co. Some of the ore is so rich that it can be whittled with a knife, and it is said that the surface showing is the greatest ever found in Banner. The latest news is that Jim Monroe has also struck it big in the Silver Chief. The ledge is narrow, but is very rich, and the proprietors are very much excited. Plowman's mill has been running for some time at Shaw's mountain with very good results, I am told. Several mines are working and are looking first-rate. Very little placer mining is going on this season. K. P. Plowman has leased his claims on Bear Run to a Chinese company, who are doing very well.

MONTANA.

STRIKE IN THE MOULTON.—*Inter-Mountain*, June 22: In the face of the 200 ft south crosscut of the Moulton, a ledge was struck this morning. The face of the crosscut is 138 ft from the shaft. Mr. J. R. Clark has come down from the mine and reports the ore body 3 ft wide, the ft wall not having been encountered. The quartz, Mr. Clark says, it is not exceptionally high grade, though the outlook for a fine ledge is very promising.

THE MORNING STAR.—Sinking operations on the Morning Star are delayed on account of the non-arrival of the machinery recently ordered. In the meantime the ore product has considerably decreased.

THE Eureka mine, near Jefferson, has been recently sold to New York Capitalists, who intend at once to begin extensive operations on the property. The new company will probably purchase the Helena reduction works for the treatment of Eureka ore. The amount for which the mine sold is not stated.

BONSER.—Inter-Mountain *Freeman*, June 19: Last Friday, Messrs. Longmaid & Sherrard bonded to Albert and Karl Kleinschmidt and James Ryan, the Katie, Buster and Judith quartz lodes, mill sites and placer ground at Basin City, for the sum of $100,000. The several properties will be vigorously developed. The Kleinschmidt Bros are the largest merchants in Montana.

THE PARROT.—The engine of the Parrot Smelting Co., has left Dillon, and by the middle of July the works will be in operation. The company will obtain ore from the Parrot mine, which they are now sinking on with that view. They will also purchase custom ore. If the story about J. Horst having sold a mine at Red Mountain for $120,000 be true, that insures the mule tramway from here to Helena, being built by Red Mountain, as the trail by that route is but 45 miles long.

OREGON.

ITEMS.—The Wood River excitement seems to be flattening out. Cleaning up is still progressing at the Sterling mine with big results. Logg & McDonnell, of Jackass creek, are still engaged in cleaning up, and doing well. Carson & Co., of Waldo precinct, made an excellent run last season, all things considered. Several miners are now prospecting in the vicinity of Palmer creek, some of whom are setting sluices. The various Chinese companies in different parts of the county have about cleaned up, and are making their appearance in town. They are becoming fewer every year.

JOHN BOLT, the genial Applegate merchant, was in town Saturday, who informs us that Jack Layton is washing off dirt at his mines with a 32-inch pipe in a manner that is wonderful to see. Mr. Layton expects to make a good clean-up, despite his mishaps of the forepart of the year.

QUARTZ.—Messrs. Seybert, Anderson, Mullen & Springstead are interested in a quartz ledge on the Wagner creek hills that promises handsomely. It is well defined and the ore is of an excellent character. S. M. Robinson informs us that some excitement exists in that section in consequence of this discovery.

APPLEGATE.—Another clean-up was made at the Applegate Gravel Co.'s mines recently, which proved satisfactory. Dan Silva, an experienced miner, has leased these diggings and will run them on his own account hereafter, commencing work immediately. The Chinese connected with the enterprise were invited to go, and they went.

OUR Leland correspondent, under date of the 19th, says: The Josephine M. Co., of Portland, of which John Salmon is superintendent, is putting up one of Wm. Salmon's late improved quartz mills on Tom East creek, about 2 miles from the Esther quartz mill. The mill will be ready to run in about 3 weeks. The company will first test the ledge between Cayote and Grave creeks, known as the Hopkins, Ford & Buck ledge. Mr. Salmon is putting the mill in the building formerly used by Hopkins & Co. for their arastra, and will he run with water power. Wm. Ruble, on Coyote creek, has about finished cleaning up, with good results.

UTAH.

PARK CITY NOTES.—Salt Lake *Tribune*, June 23: The shaft of the Utah is being sunk with as much speed as possible. The new shaft at the Lady of the Lake is down over 60 ft, being worked by a whim. New hoisting works will follow. There is talk of Pinedo sinking a shaft on one of the claims north of the McHenry—probably the Wilson & Barrett. The McHenry remains shut down, to the disadvantage of every one. The mines are all looking well. At the Jones Bonanza a drift to cross the vein is being run on the 300 level. Kidneys of rich ore are found throughout the country rock, indicating what may be expected when the vein is cut. The carpenters, under the charge of J. D. McKenzie, are busy framing the timbers for the new hoisting works at the Ontario.

Village Improvement.

The idea of improving California villages and rural towns is taking deep root in the minds of the people and we expect tbe futnre will show most pleasing results. The pioneer improvement society of this coast at Bsrkelsy, Alameda county, celebrated the occasion of its annual meeting hy an open air picnic and literary exercises, which were a pleasnre to all who attended. The plan of the meeting was very simple and can hs commsnded to othsr organizations. Each msmher of the society arranged to picnic his own non-resident frisnds and eacb entertained a part of the invited guests of the society. Thns the gronnds were dotted with little picnic parties, each heneath its own oak tres, and the sounds of merriment showed tbat the meetings and rsfreshments were enjoyed. By this arrangemsnt of small groups the lahor of preparing the repast was distrihuted through the wbole msmhership of the society, and the effect was far hetter than if a large union tahle, as in old-styls picnics, had heen attsmpted. The coming together of ths townspeople and their friends did much to make the efforts at improvement more widely known and will aid the enterprise in the fnture.

Chief of the literary exercisss was the annnal report of Prssident G. D. Dornin, which included many points calculated to awaken villagers everywhere to nnited efforts to heautify their surroundinge. In this intereet we present some of the leading ideae and facts from Mr. Dornin's report.

There wae much to he done. The village had just been evolved from the raw conditione of a farming community; primitive ranch fencee here and there presented an unsightly tumhledown condition as obstructions in the highways; the etreets and nnenclosed lands were used as common pasturage for cattle to the detriment and destruction of the trees which enterprising property ownere might have planted. It wae essential that a ehowing should he made dnring the present season to give the work a proper impluse; there was a great deal of inertia or indifference to overcome; much misnnderstanding of the purposs of the promotere, and some covert opposition. But these have heen in a measure corrected and gradually overcome; the large proportion of land owned hy non-residents, and made a common hy lack of fences, has to a considerable extent heen brought under fence, defining the etreet linee, and giving an orderly appearance to the town. In every direction tbe eye rests upon new trees, neatly etaked, and presenting a diversification to the ecenery.

The first attention of the association wae given to the introduction and planting of shade trees; to this end, certain trees were recommended for certain streets, heet adapted for their growth, and were procured in quantities to enahle the association to furnish those who deeired them at low prices.

The universal hlue-gum, broken and twisted in many places hy vagrant cattle and lack of proper attention, has in many instancee been uprooted and given place to the graceful maple, linden, elm, ash or poplar. Nor is it the intention of the Association to be eatiefied with this limited range of varietiee. Acting upon the snggestions of our worthy Professor of Agriculture, and with the advantages of the proximity of the experimental farm of the Univereity, it is hoped that we may introduce along our avenues species of graceful trees yet comparatively unknown to our State; that our Berkeley hilleide may be representative of the flora of many portions of the world.

While mnch has heen done, we are yet in the infancy of our village improvement association. The work of tree planting which has heen already accomplished will make it easier to extend next season; the now vacant epaces will he filled, and along every avenne leading into our town will be presented parallel rows of graceful trees; our little park at Dwight way etation will eoon form a fitting introdnction to our pleasant village; the grading of Dwight way hy the enterprise of the neighhors under the inspiration of our association, will necessitate similar work in the adjoining streets. The man who was indifferent to the condition of his nnsightly fence will feel rehuked if hie is the only one among the many neatly repaired and painted or whitewashed fences on the street or, if he is indifferent, his wife and daughters will prove thorns in the flesh until the neceseary repairs are made. The unsightly keroeene can, or discarded hottle will be more obstructive, hecanse of the growing public opinion which condemne them as out of place on the street or on the adjoining lot.

There is a great deal to he done, and we most need individual action; the great work of this association is not to he done directly hy the association or its officers; it muet come from the spirit of improvement, acting in each individual memher of the community, man, woman and child. Nor should we wait nntil each of our neighhors is ready to act; two or three perεons (neighhors) can inaugurate the necessary improvements in their proximity, and hy a eteady pressure may in due time hring all into the plan; if the ohetinate or indifferent one be found, the good work ehould not etop, hut he apportioned among the more willing, liberally disposed, and public-epirited neighhore; the compensation will he had in the gratifying reults of our lahors.

A CONFLICT between the Russians and Chinese in Kashgar is said to he inevitahle.

Esmeralda District.

One of tbe best posted men on the mines of Esmsralda conuty, writes the following lstter to the Virginia *Enterprise*: "Now I am going to give some reminiscences of the past and present of Esmeralda connty in my simple way, making this lettsr a compendium of facts. Early in the spring of 1863, I hecame a citizen of Aurora. I was attracted to Nsvada hy the flattering acconnts given hy the pnblic press of the inexhanstihls hodies of rich gold and silver ore. Virginia city was in a fnll hlaze of excitement at the time, as was also Anstin and Aurora. I have watched the latter town in its snccess nntil $8,000,000 or $9,000,000 of the precious metals were poured into the stream of commercs within the space of three years. Aurora mnst become, some day, the attraction again.

"The old minss have nevsr hsen worked over 150 ft. perpendicular on an average, which is no mineral test, hut mere hen scratching. The monntains majestically rise one above the other like a series of steps—Hnmholdt, Martinez, Last Chance, Middle and Silver Hill—a large mineral helt passing througb tbe ridges for two miles, whicb is interspersed with hnndreds of ledges, pointing to the sonthwest and northeast and dipping to the south, imbedded witb granite and a species of mixed slate. The country does not seem to be hlistsred and hroken np hy volcanic or other internal physical causes, like some other parts of Nevada. What the camp wants ie a liheral distribution of capital in its numerous mines, with a judicioue and honest management. With a thorough exploration it will repay and redound to the honor of ite name. Aurora means the Goddess of Light or the rising light of the morn. The monntaine are rihhed with gold veins that have worked $1.50 to the ponnd. She mnst take her position among her eister mining towns again in a large output of rich ores. The place mnst hecome one of the financial levere of streugth to this State. It has all the natural surronndinge, with an ahundance of wood and water. Among the most noted mines of the past is the Del Monte. This mine was in 1863 a magnificent piece of property, disbnreing a heavy percentage of all the hullion yielded here.

"At preseut there is the Empire mine, owned hy rich capitalists; the Garihaldi mine, witb a government patent; the Crocket and Sam Patch lie adjoining these rich ore veins. Humboldt hill has among ite noted mines the Humholdt East and West. These mines are owned hy men of considerahle experience, and will, at some time in the fntnre, greatly add to the importance of Esmeralda mining district. Middle hill is fartber to tbe west of both of the last named mountains, and contains a great number of quartz veins—the Dnrand, Young Americn and Grand Trnnk, which noted ledge can he traced into Last Chance hill, where ite name is the Thanksgiving. Not far from this ie the Rothschild. All of these mines have large croppings and rich ores, with a prosperous fnture. Silver hill ie eituated at the westerly end of these mountains, and has among ite succossful ore-prodncing minee tbe St. Lonis, Antelope, Centennial, Poor, Cortez, Utah and a number of others that must eventually swell the bnllion yield, if eucceesfnlly developed to great depth. To the north of Anrora, 16 miles, is a mining district known as Elhow, which has flattering prospects of good gold and silver veins. This is not very far from the Sweetwater valley and ite beantifnl mountains; it and Smith's valley are surrounded hy mineral hills, which, I think, will be the scene of successful mining enterprises. The people of the two valleys are kind and conrteone."

Abandonment and Re-Locations.

In reply to a Montana inqnirer, the Commissioner of the General Land Office says: If John Doe ewears that a claim of which he wae at one time part owner, wae originally located in 1875, as yon state, and that during the years 1878 and 1879 no work was performed or improvemente made on the claim by the former locators or their grantees, and Richard Roe ewears in effect that no expenditures were made upon the original location eince September 20, 1878, the Depa tment does consider the evidence efficient to prove abandonment, Roe's affidavit is worthlese in that it doee not show that the required expenditnres were not made npon the claim hefore the 20th of September, 1878, to enable the owner to hold his location for that year, and if such expenditures were made at any time dnring that year, the claim would not have been snbject to re-location hefore Jannary 1st, 1880, for failnre to work the same to the neceseary entent, and in ench case a re-location in Decemher, 1879, mnst necessarily he void.

Under date of August 27, 1879, the Commissioner of the General Land Office held that where a re-location is had npon the ahandonment of a prior locator, the applicant is reqnired to furnish proof of snch fact hy affidavits of himself and other creditahle partiee who are pereonally acquainted with the facts, and that "euch affidavite should state the facts with all poesihle particnlarity, giving dates of occupation and ahandonment, with circnmstances attending the same." In accordance with this ruling the applicant muet supplement the evidence of John Doe with that of his own affidavit and that of one or more creditahle witnesses having knowledge of the faots constituting the alleged ahandonment.

The Pinal County Black Diamond Coal Fields.

Mr. Jake Schneider hrougbt in a big specimen of coal from the fields in Pinal county, situated ahout 40 miles from Pinal, southeasterly. The road runs hy the way of the Bowman mine to Riverside, and thence to Dser cresk. The coal fields extend from the Dripping springs west to the head of Deer creek, an extent of 10 to 12 miles in width. Thess fields are all located. Mr. Schneider's location is near the center, and is celled the Mountain Visw. The layer of coal is from five to sevsn feet in tbickness where the work is, and he has only gone down ahout ten ft. The claim is 160 acres, and it has been prospected in varions places, to ascsrtain the fact that this layer extends all over the claim, and fonr miles further np to the head of Deer creek. The layer of coal dips to the sonth and runs from east to west. Andsrson Lilley & Co. have made great dsvslopments, and have sunk several shafts. There is about 100 tons of coal on the Bonanza dump. The coal contains over 90% carhon, and very little sulphnr. These coal fields are all in Pinal connty, and are called the Black Diamond coal fields.

The country is rolling, and is sasily accessihle from Pinal and the Gila river. The conntry is wsll timhered with pine and csdar, sxsllent for all mining pnrposes and railroad ties, etc., the trees are generally from one to two feet in diameter, and 25 to 40 ft. high, and in many places the forest is so dense that it is hard to pase through it. The timher extends about eight milee square, and the coal fields are under and close to this forest. Tbere is plenty of running water. The coal fielde are ahout 12 miles sontheasterly from the Gila river, up Deer creek.

In near proximity to these coal fields are the silver mines on Saddle mountain, called the Hayes mine, the Goldcn Eagle, Mayhell, Blackspar and othere about eight miles northerly. On the Hayes there is a shaft of 80 ft., carhonate ore, the pay streak two and a half to four ft. wide, asays from $30 to $600. The Golden Eagle has a shaft of 75 ft. and 26 ft. crosscnt; ore, carhonate, carriee also gold, assaye $100 in gold and $80 in silver. Mayhell has a 60-ft. shaft, carhonate ore, assays average $100. The Blackspar has a 40-ft. shaft; two ft. pay streak average assay $100. There are 15 or 16 locations, all ehowing good ore on the top. The camp is lively and prosperous. At the month of San Pedro they are now erecting a five-etamp mill, for custom work.—*Pinal Drill.*

Chinese Placer Mining.

A gentleman who has been examining the methods of the Chinese who are engaged in placer mining on Gold canyon, helow Silver City, eays they excel white miners in saving fine gold under difficultios. In the gravel of gold canyon is an immense amount of hlack sand and great qnantities of iron stones and pehhles.

The eand and etones settle to the bottom of the slnices, and there hecome eo compact that the gold cannot reach the quicksilver, hut is carried away and lost. The Chinese have their slnicee so arranged that all the material passing throngh them falls into a large shallow tank, the hottom of whicb is floored with iron pierced with holes. From this is ehoveled or forked all the material that is too coaree to pass through the screen.

The material that falls through the screen with the water is carried out npon hroad slnicee covered with hlankets, and the process then employed is very similar to that nsed in ordinary hlanket slnicing.

By the nse of the screen in the etart they greatly reduce the hnlk of the material to he handled in after operations, and at once get rid of all coarse, heavy and tronblesome etones and gravel. The earth and light material of all kinds float away with the water, and gives no more tronhle, therefore little is left hehind on the blankets hnt the gold and black sand, and the qnicksilver and amalgam that have fonnd their way into the gravel along the hed of the stream.

In places where the ground is flat, and euffi-cient fall cannot he found to carry away the tailings from the end of the sluices, the plan adopted hy the Chinese saves a good deal of work. It ie mnch easier to ehovel the large rocks out of the hox than it would he to etand at the tail of the etring of slnices and there ehovel ont coarse, fine and all ae it comes down.

As the Chinese work, they have no trouble with the fine stuff. It rune away of itself when separated from the coarse and heavy material.—*Virginia Enterprise.*

SMELTER COMING AT WOOD RIVER.—We had the pleasure of meeting J. B. Parker last Wednesday. He is looking up the indncement which the Wood River galena helt offers to one who will ship in a first-class hydrocycle. Mr. Parker is just in from South Mountain, Owyhee county, where he has a 20-ton water-jacket furnace, and an engine of 24-horee power. It is all ready for use, and is qnite new; was constructed in Portland, Oregon; and if Mr. Parker can find an eligible location to ore, wood and water, it will prove a valnahle piece of property for this eection. The gentleman hae gone on a tonr of inspection np the river, and, no donht, will locate his site hefore he returns to Sonth Mountain.—*Wood River News.*

North Utah Mines.

For two years past, a number of plodding, patisnt minsrs residing in Ogden have, with an abiding faith in the mineral wealth of the conntry around them, dslved and dng, drilled and blasted in the mountains and canyons. Month aftsr montb bas passed with results far from satisfactory, financially speaking, nntil at last, indications warrant them in believing that thsy will ere long show dsvelopments at which the world will wonder. The *Pilot* man in spsaking of the outlook says that this too long neglectsd district is bsing prospected hy only a few men with sufficient ensrgy and perssvsrance to hring out a knowlsdge of the wealth stored away in these hills. At various places along the range from Wsher csnyon to a point some miles north of Brigham city, men are engaged in delving for minsral with various results. North of Ogden canyon ths country has heen hut little prospected until we reach Willard district, which now gives the richsst promise of any north of Salt Lake city.

Still fnrther north, the mineral belt is found, and at a point northwest of Brigham City, nnmsrous prospects have beeu located and some work done. The Keystone mine is prohably tbe best ons there at pressnt, and has had the most work done on it. It is located at a point ahout thrse milss from Brigham City. The first assay made on ore found at the surface gave gold, $90; silver, $23; and lead 45%. The vein at the surface was only six or eight inches, but in sinking the vein has opened out to ahout five ft., and the ore has changed so that a late assay gave gold, $44; eilver, $78. A shaft hae heen snnk hetween 40 and 50 ft., and ahont 40 tons of rich ore is piled on the dump. S. T. Joslyn, Paymaster of the Union Pacific, George Thatcher, Snpt. of the Utah and Northern, and several other railway men are the fortunate owners of this mine. A sample of the ore lying on our table is fine galena, with carbonates, and we are told that the quantity of carhonate ore increases as sinking is done. In the near fntnre we expect to see hundreds of good mines in the portion of the great Wasatch range lying north of Weher cauyon, in a distance of 30 miles.—*Southern Utah Times.*

Mining Swindles in New York.

New York is said to he cursed at present with some of the most hare-faced swindles that were ever attempted to be foisted upon the pnhlic. The Wall Street *News* saye some of theso so-called companies have not even a prospect, or a foot of mining ground, and yet they are issning stock, sending out elahorate proepectnses and telling the moet glaring falsehoods to sell their stock. There are fools who huy it, too, and after they have their eyee opened to the fact that they are ewindled, they will place all mining companies, whether good or had, in the eame category with the one hy which they were swindled, and all the men in creation oould not make them tonch another mining stock or invest a dollar in a mining enterprise. These ewindling mining concerns do more to injnre the mining industry than any other one thing, and the *News* thinks there ehould he some way devised of pntting a stop to the hnsiness.

There is no other industry that paye hetter than mining, if it is legitimately prosecuted, and it is the duty of every honorahle mining man to do all in his power to protect the indnetry from a class of men whose every action tends to disgrace it. There are papers in New York which make a speciality of mining, and pretend to give impartial newe from mining districte on the Pacific coast. It is evident, however, to their readers in this part of the country, that they are influenced hy coin considerations, and only condemn a mining ewindle when they are not paid for pnffing it, or, at least, not condemning and exposing it. It is the duty of every local paper which places the permanent prosperity of the mining indnetry of its vicinity ahove the temporary advantages which it derivee from the ephemeral success of a swindling company to expoee all euch and inform the pnhlic of their rascally operations.

Cheap Transportation.

Tbe Chicago *Mining Review* eays: "An overestimate on the valne of easy transportation can hardly he made in figuring on mining enterprises. An experienced man recently remarked in the presence of the writer that he wonld never again he caught off water or railroade in his mining ventures. The force of the assertion was felt when he pointed out the fact that many of the hest producing mines were utterly valueless, so far as the world'e market enters into the husiness, nntil railroads were hronght within easy distance. The first step in mining is to demonstrate the fact that railroad or water transportation ie at hand; and then may the mille and smeltere he pnshed to their utmost without feeling that the hullion product must go to pay the monntain road wear and tear on wagon tires and mule muscle."

To estahlish possessory right to a mineral claim reqnires, under the regulations of the General Land Office, a complete abstract of the claimant'e title hy the proper recording officere of the county or counties in which the claim is located, or a certificate from the same that no conveyances, other than tboee recited, are of record.

The Black Hills, Arizona.

A correspondsnt of the Arizona *Miner* has tbis to say of ths Black hills of Yavapai county: Stretching away west on ths eastern slope of the Verde river is an almost unbroken rango nf mnuntains, known at different points by differ-ent names, and presenting a variety of scenery unequaled by any others in northsrn Arizona. Jnst back nf the rich mineral belt that spans Lynx creek, Groom creek and the Hassayampa, they rise from low hills to minor mountains, and ars known as the Black hills of Yavapai county. Leaving Prescott and traveling about 20 milss cast you come to Coyoto Holes, whers yon camp, deriving its name from that harmless little auimal that Mark Twain describes as mak-ing night hideons with its philharmouic notes. Leaving there in the morning yon climb about 700 ft. and gst on top of the mesa. Here you are in paradise, for as far as the eye can see the giant pinss raiso thsir lofty hsads and gresn cedars spread their branches over the grass-cov-ered hills, making you think of Salt river and how you would liko to live thero if Yavapai was not in Arizona. Traveling in an east-erly direction yon come to tho break of the lofty mesa, from whose lofty top yon oan view the ranches on the upper Verde, dis-tant about eight miles, and feast your eyes on scenery enough to do any common man, but as the old saying is, "a man cannot live on scenery," you sinch your horse and com-mence to descend to the rich copper fields known as Verde district. Down you go for 1,500 or 1,600 ft., most of the way through fine min-ing timber. You arrive at last to look on cop-per enough to bottom the world. This is Head's camp, where is located the cslebrated Enreka mine, sold a short time ago for big money, and shows up as few mines ever did with the amount of developments. On the opposite side of the canyon are the locations of Messrs. McKin-non & Rufner, the principal one being the Wade Hampton, which shows up some very fine ore, and for miles can be ssen the same sign of per-manency of copper, so that it can he said of the hoys in this camp they are copper fastened. Leaviug the canyon from this group, you take the trail to Dorethy's location, known as the Emmet, which is nnder negotiation for purchase by a Philadelphia company. Passing this you take the old Indian trail from Prescott to the Verde, and in abont three miles find yourself at the New York camp, and again in copper, the principal location being the Hampton, owned hy Kennedy & Whittaker, of whose hospitality you will have to partake and stay all night. (Cortain down till morniug.) As you commence to ascend again to the mesa, they will show you the natural curiosity of Musical gulch, the theory of which is that old Mother Natnre got mad at some of her lower regions and blew them out, and only leaving a hole for some man like Mooney, of Grand Canyon fame, to bottom. Up, up you go and take a little *pasea* on Mingus mountain, named after the enteprising proprie-tor of the Mingus ranch, who has about 15 acres of potatoes planted at an elevation of abont 8,000 ft., raising a good crop every year without irrigation. From there you take tbe wagon road to a fine stock ranch two miles from Min-eral Point district, or Grapevine springs, where are some locations, but as yet smally developed, promising bonanzas as developments go on. When you arrive at the ranch, you will get some of the best beef in the county—made ten-der after you have lived on bacon and heans for a few days. He don't care how often you come; everybody knows him—Tom Saunders. After partaking of his hospitality and swapping yarns, you come back to Prescott with a good name for the copper fields of Black Hills.

U. S. J.

Journalism.—President Garfield, in bis ad-dress hefore the Ohio Editorial Association, at Cleveland, said: "It helongs to the honor of the press to have developed within the past few years as gallant a body of men, of as hright in-telligence as the world knows in any profession —men who have illustrated what beroism is by hringing from remote and dangerous quarters those items of intelligence that do so much to enlighten the world. Two forces are needed to improve, enlarge, and ennoble the sphere of jonrnalism. The first rests with us who are out-siders. If hy all the means in our power, we can make the people so intelligent that they will only patronize the best and worthiest journals within their reach, we shall have done our part. And if on your part you do so enlarge the sphere of your work, and increase its intel-ligence and justice and force, that ignorant and weak men will not want your jonrnal—and only the worthy and honorahle will deserve it—be-tween you and ns, the profession of journalism will go in no nohle inprovement, hettering that growth, and increasing the security of liherty in your country."

Ures District, Sonora.—Mr. Norton and Don Garcia will leave Tucson in a few days to commence work on their mines in the district of Ures. These mines are witbin 30 miles of Hermosillo; one and a half miles off the Sonora river, and not more than two miles from the main traveled road. These mines constitute a group, rich in precious minerals—chlorides, hlack sulphurets, and native silver—with all facilities for working within two miles of the property—formation porphyry and talc. The surveys of the Guaymas railroad, pass within eight miles of the mines.

Useful Information.

New Method of Inlaying Wood.

A new msthod of inlaying wood has been contrived by a furniture mannfacturing houss in England. Ths process is as follows: A vsneer nf the same wood as that whicb the design to be inlaid consists—say sycamore—is glned en-tirely over ths surface of any hard wood, such as Amsrican walnnt, and allowed to dry thor-oughly. The desigu is then cut out of a zinc plate about one-twentisth of an inch in thick-ness, and placed upon the venser. The whole is now subjectsd to ths action of steam, and made to travel bstween two powerful cast iron rollers of eight inches in diameter by two ft. long, two above and two below, which may he brought within any distance of each othsr by screws. Ths enormous pressure to which the zino plate is subjsctsd forces it completely into the veneer, and the venesr into the solid wood bsneath it, while ths zinc curls up out of the matrix it has formed and comes away easily. All that now rsmains to be done is to plane down the veneer left untouched by the zino nn-til a thin shaving is taken off the portion forced into the walnnt, when the surface being per-feotly smooth, the operation will be completed. It might be supposed that the result of tbis for-cible compression of the two woods would leave a ragged edge, but this is not the case, the joint being so singularly perfect as to be unap-preciable to the touch; indeed, the inlaid wood fits more accurately than by the process of fit-ting, matching, and filling up with glue, as is practiced in the ordinary mode of inlaying.

Vegetable Leather.—Tbe London *Mechan-ics' Magazine* states that there are very exten-sive works at Stepney Green, London, in which great quantities of artificial leather, are mann-factured. In appearance it resembles common leather, and it is only hy a very close scrntiny that the distinction between them can he detected. It is manufactured in wehs 50 yards in length, and four-and-a-half feet in breadth, and is now mnch used for bookbinding, and several other purposes for which tanned calf and sheepskin are employed by us. It is also used hy saddlers for making barness, and it may he made of any thickness desirable, and is capahle of being stretcbed or cemented. India rubbsr is the principal substance of its composition, but there are other ingredients mixed with it, wherehy its leather qualities are secured. The method of making it is not given, and it appears that this is kept secret; but that such a substance is man-ufactured, sold and used in large quantities is a fact of too great importance to be overlooked.

Sugar from Rags.—Brooklyn, N. Y., it seems, does not enjoy a monopoly in the manu-facture of sugar from rags, as recently described in their columns. We learn from a Enropean journal that this manufacture is now carried on upon a large scale in Germany. A German fac-tory is regularly ongaged in husiness, treating the rags first hy sulphuric acid so as to convert them into dextrine. The dextrine is bleached, hy means of milk of lime, and then submitted to a new sulphuric acid batb stronger than the first, after which, being transformed into crys-tals of glucose, it can be employed in jellies and confections. The glncose which is obtained hy this process can be sold very cheaply, and it resembles chemically that which is derived from grapes. Tbe attention of the German government has heen called to tbe danger, in a hygienio point of view, which may arise from the use of this article.

Preserving Wood.—The improved French method of preserving wood hy the application of lime is said to work well. Tbe plan is to pile the planks in a tank, and to put over all a layer of quick-lime, which is gradually slaked with water. Timher for mines require about a week to he thoronghly impregnated, and other wood more or less time according to the thick-ness. The material acquires remarkable con-sistence and hardness, it is stated, on he-ing subjected to this simple process, and the assertion is made that it will never rot. Beech-wood prepared in this way for hammers and other tools for iron works is found to acquire the hardness of oak, without parting with any of its well-known elasticity and toughuess, and it also lasts longer.—*Am. Manufacturer.*

Alum Water for Vermin.—Millers and others, who are tronhled with bugs and worms infesting crevices in the holting chests and other machinery, are recommended to try hot alum water, which is snggested hy high scien-tific authority, as a good method of destroying creeping things. Take two pounds of alum and place it in three quarts of warm water (or in that proportion), and let it stand on the stove until the alum disappears. Apply while hot witb a hrush to the crevices and other places that conceal the insects, or use it as the exigencies of the case demand.

To remove the ink from copying pads it is best to employ a soft sponge dipped into water as hot as the hand will hear. Hold the collo-graph inclined over the hasin, and wash without ruhbing. Chill the surface by applying cold water. A great numher of copies may he taken if the pad is dampened with a sponge dipped in cold water, when the print begins to get dim.—*Pharmacist.*

Working Under Water.—Mr. Flenss, of Portsmonth, England, has recently dsvised a new apparatus for snabling psrsons to work under the water and in the pressnce of noxious gases. Some practical applications of the mer-its of the device were recently given. He takes bslow with him a supply of concsntrated nxy-gen in a small reservoir which is slung nn his back like a knapsack. At svsry respiration from the tank, which is effectsd by means of a tnbe and month piece, the exhausted gas, after being strained through a sponge saturated with caustic soda, retnrns to the tank, the impure ingredisnts alone being permitted to escape. In this way he can remain nnder watsr for four hours, and can penetrate to sitnations whicb are impossible to an ordinary diver, who is com-pelled to drag a lsngthening pipe at svsry step, and is always liable to the dangsr of gstting en-tangled with the means which supply him with air. Whsn entsring an atmosphsre charged with smoke and poisonons gases, Mr. Fleuss divests himself of the diving dress, his only pro-tsction being tight-fitting coverings for his eyss and nostrils. Thns providsd, Mr. Flsuss has gone unharmed throngh fnmes of the dsnssst and most pungsnt description.

An Improved Mortar.—Some time since the use of sawdust in mortar was recommended as snperior even to hair for the prevention of crack-ing and subsequent peeling off of rough casing under the action of storms and frost. Someone by the name of Siehr says that bis own house, exposed to prolonged storms on the seacoast, bad pieces of mortar to be renewed each spring; and after trying, without effect, a number of snbstances to prevent it, he found sawdust per-fectly satisfactory. It was first thoronghly dried and sifted through an ordinary grain sieve, to remove the larger particles. The mor-tar was made by mixing one part of cement, two of lime, two of sawdust, and five of sharp sand, the sawdnst being first well mixed dry witb the cement and sand.

To Test Quality of Glue.—Dry glue steeped in cold water absorbs different quantities of water, according to the quality of the glne. From careful experiments with dry glue im-mersed for 24 hours in water, at 60° Fahr., and thereby transformed into a jelly, it was found that the finest ordinary glue, or that made from white hones, absorbs 12 times its weight of wa-ter in 24 hours; from dark hones, tbe glue ab-sorbs nine times its weight of water, while the ordinary glue, made from animal refuse, absorbs bnt three to five times its weight of water.

Imitation of Ground Glass.—The following recipe for imitation of ground glass is from an Antwerp *Scientific Journal:* Paint the glass with the following: Sandarach, 18 drachms; mastic, 4 drachms; ether, 24 onnces; henzine, 6 to 18 ounces. The more benzine, the coarser the grain of tbe immitation glass will be.

Good Health.

Healthfulness of Fruit.

Fresh, ripe, perfect, raw fruit is safe and healthful at all seasons of the year, and amid the ravagcs of disease, whether epidemic, en-demic or sporadic, general, special or local. Under proper restrictions as to quantity, such fruit as named will cure a diarrhœa, aid in re-moving a cold, colic, fever or any other disease wbose treatment requires the bowels to he kept freely open; for this effect, fresh, ripe fruit is acknowledged to have; hut to be used advan-tageously in health and disease, the following rules are imperative:

1. Fruit should be eaten ripe, raw, fresh and perfect.
2. It should be eaten in moderation.
3. It should he eaten not later than four o'clock in the afternoon.
4. No water or fluid of any description should be swallowed within an hour after eating fruit.
5. To have its full heneficial effect, nothing else should he eaten at the time the fruit is taken.

It is to the neglect of these observances that erroneous impressions prevail in many families, and to an extent, too, in some instances, that the most luscions peach, or apple, or bunch of grapes, is regarded as that much embodied cholera and death. When will men learn to he observant and reflective?—*Journal of Health.*

Injurious Effects of the Buttonball.—*Les Modes* states that a French medical journal has recently called attention to the injurious ef-fects that are apt to follow a residence near the common shade tree, the huttonball or plane tree. The fact has long been known, even from the time of Pliny, that a stay near these trees is often followed hy an irritation of the air pas-sages, followed hy a disagreeable and sometimes persistent cough. This is due to the fact (famil-iar to hotanists, though perhaps not to the gen-eral puhlic) that the young shoots, leaves and stipules are covered with a fine, thick down, composed of minute-branched rigid hairs, which falls off as these parts become older, and often floats in the air in large quantities. It is the inhalation of this that canses the throat diffi-culties. It often causes serious annoyance to employees in nurseries where the tree is raised, and who fail to take precaution against it.

Treatment of Sunstroke.—The peculiar atmosphsre of California admits of much more exposure to the rays of the summer sun than can be endnred in the Eastsrn States. But it is still well to know what to do in case of sun-stroks, as prompt action is gensrally necssary to avoid ssrious results. An exchange says: In case of snnstroke, loosen the patisnts clothss and baths the head and entirs body with cool water, and with moistened hands ruh ths extremities, ths neck, and the whols lsngth of the spins, rubbing in a downward direction to draw the blood from ths head. As soon as boiling water can bs obtained, put a dry blanket round the body, then ring flannsls from the hot water and apply thsm quickly to the region of the stom-ach, liver, bowels and spine, over the blanket; also, immerss the feet in hot water, or wrap thsm in hot flannels as far as the body. Re-wring the flannsls oncs svsry five or eight minntes for half an hour or more, then remove them and apply cold water in the same way, eithsr by cool towsls or sponging with cool water; dry well and rub the snrfacs lightly and briskly with the hand nntil a glow is produced. As soon as the patient can swallow, give him hot watsr to drink, and plsnty of it, with oc-casional bits of ice or sips of cold water. Often, of course, the attack is so slight that so thorough treatment is not necessary.

A medical discovery of great interest, if veri-fied, was recently announced by Dr. W. Cheatham in the Lonisville (Ky.) *Medical News.* This gentleman announces that he has made the discovery that the use of the sulphate of eresine makes it nnnecessary to use specta-cles in case their use is caused by a flattening of the cornea from old age—a very common com-plaint. He states that tbis drug possesses the property of acting especially on the ciliary mus-cle, and contracting it, which has the effect of increasing the convexity of the cornea. He reo-mmends dissolving one gram [grain?] of the sulphate of eresine in one ounce of water and putting one drop in each eye at hedtime. At first it is said to produce the opposite effect—great convexity of the cornea—or near-sighted-ness, hnt this is said to soon pass away. He affirms that, in his opinion, the remedy is per-fectly safe, and recommends its use in cases of inflammation of the eye from varions canses, for weakness of this organ, etc. Until it has been definitely ascertained that this remedy is not attended with unfavorahle secondary effscts, which can only he determined after its pro-longed use, we feel disposed to recommend cau-tion in its application. The observation, how-ever, is of the utmost interest.

Wool Sorters' Disease.—For some time past considerable discussion has arisen in tbe manu-facturing districts of England over a malady called wool sorter's disease. Mr. Roberts, the medical officer of health for the district of tbe Keighley Local Board, treats at considerable length in his annual report for 1880 of the nature and preventives of this disease. In snmming up from the report it is recommended that the fol-lowing precautions be taken without fail hy wool sorters: "(1) Wool sorters not to sort dan-gerous wools when they have any sore places or cracks on their hands or fingers; (2) to be oare-ful not to wipe or ruh their faces with their hands while sorting, especially if they have any cracks or pimples on the face or lips; (3) to wash their hands before eating, and to take neither food nor drink into the room where the wool is being sorted." The sorting room, he adds, ought to he well ventilated, to be swept regularly, and to have the walls and csilings whitewashed twice a year.

Protection Against Mosquitoes and Flies. A correspondent of *Nature* writes as follows: A young friend of mine, severely hitten hy mosquitoes, and unwilling to he seen so disfig-ured, sent for quassia chips and had hoiling water poured upon them. At night, after washing, she dipped her hands into the quassia water, and left it to dry on her face. This was a perfect protection, and continued to be so whenever applied. At the approach of winter, when flies and gnats get into houses and some-times bite venomously, a grandchild of mine, 18 months old, was thus attacked. I gave the nurse some of my weak solution of quassia to be left to dry on his face, and he was not hitten again. It is innocuous to children, and it may be a protection also against bed insects, which I have not had the opportunity of trying. When the solution of quassia is strong, it is well known to be an active fly poison, and is mixed with sugar to attract flies, but this is not strong enough to kill at once.

Buttermilk as Summer Food, Drink and Medicine.—A Detroit physician asserts that for a hot-weather drink nothing eqnals butter-milk. It is, he says, "hoth drink and food, and for the laborer is the hsst known. It sup-ports the system, and even in fever will cool the stomach admirahly. It is also a most val-uahle domestic remedy. It will *cure* dysentery as well and more quickly than any other remedy known. Dysentery is really a constipation, and is the opposite of diarrhœa. It is inflammation of the howels with congestion of the 'portal circulation'—the circulation of blood through the bowels and liver. It is a disease always prevalent in the summer and autmnn. From considerable observation I feel warranted in saying that huttermilk, drunk moderately, will cure every case of it—certainly when taken in the early stages."

MINING AND SCIENTIFIC PRESS.

SAN FRANCISCO:
Saturday Morning, July 2, 1881.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Prospectors as Trustees; Sutter's Mill, 1. Passing Events; Oakland Harbor Improvements; Ourselves; The State Mining Bureau; Stored Electricity; Foundry Notes, 8. An Improved Hydraulic Ram; The Electric Light for Mines; Roasting Ores Containing Lead; The Advantage of Perseverance, 9. Notices of Recent Patents; Miners' Meeting at Sweetland; Powder Explosion; What do They Say About Us, 12.

ILLUSTRATIONS.—Sutter's Mills, Where Goldw as First Discovered in California, 1. Morrows Improved Hydraulic Ram, 9.

CORRESPONDENCE.—Proofs of at Lesst Two Inter-Mercurial Planets; Notes on Treeless Prairies, 2.

MECHANICAL PROGRESS.—Malleable Cast Iron; Straigbtening Shafts; New Telepb ones; Balancing Car Wheels; Photography in Mechanics; Industrial Mechanics; Industrial Indications; Fire Proof Material; To Remove Gear Wheels; Telephones, 3.

SCIENTIFIC PROGRESS.—The Mysteries of Metals; Sound from Intermittent Light; Alcohol in Nature; Vibrations from Machinery; Mind and Brain; What we Eat; Bursting Power of Ice; Coloring Vegetables Green; Absorption of the Sun's Rays by the Carbonic Acid of the Atmospbere; Measuring Stellar Light, 3.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Divideuds, 4.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Montana, Idaho, Oregon and Utah. 4-5.

USEFUL INFORMATION.—New Method of Inlaying Wood; Vegetable Leather; Sugar from Rags; Preserving Wood; Alum Water for Vermin; Working Under Water; An Improved Mortar; To Test Quality of Glue; Imitation of Ground Glass, 7.

GOOD HEALTH.—Healtbfulness of Fruit; Injurions Effects of the Buttonball; Treatment of Sunstroke; Wool Sorters' Disease; Protection Against Mosquitoes and Flies; Buttermilk as Summer Food, Drink and Medicine, 7.

MISCELLANEOUS.—Note on Treeless Prairies; Our Northern Counties, 2. Village Improvement; Esmeralda District; Abandonment and Re-locations; The Pinal County Black Diamond Coal Fields; Chinese Placer Mining; North Utah Mines; Mining Swindles in New York; Cheap Transportation, 6. The Black Hills, Arizona; Journalism; Ures District, Sonora, 7.

NEWS IN BRIEF on page 12 and other pages.

Business Announcements.

Tonite Powder Company, S. F.
Frue Concentrators—Wm. R. Knights, Sacramento.
Adams' Springs—Lake County, Co., Cal.

Passing Events.

Tbia week our sensation has been tbe nnexpected appearanca of a comet of very respectable dimensiona, and people were rather startled by being told there wera two or three of tbese celestial visitora in range, none of wbicb wera previously announced. It ia fonnd there is only one.

Here as elsewhere thoughts of 4th of July have filled tbe pnblic mind for a week past and display of bnnting, tbo imposing parade and the essentials of oratory, poetry and the one hundred and fiftb reading of the declaration, are all being planned and will he duly executed for the diversion and entertainment of the people. In this city there will he the nsual military demonstrations, festoons of flags will bridge the streets, and other decorations will not he wanting. Those who enjoy the excitement, tumult and spectacle of a city celebration will no donht he gratified by a visit to San Francisco next Monday. In the interior towns, and at the pleasure resorts where thousands are now congregated, there will be quieter obaervations of the day, and the patriotic spirit will rise as high as in the more imposing demonstrations.

THE average monthly bullion output of Arizona since January is over $650,000. The average will he much larger during the next seven months.

Two English ships with cargoes of railroad iron for the Oregon Railway and Navigation Co., arrived at Portland Saturday.

Ourselves.

To-day, the MINING AND SCIENTIFIC PRESS comes of age, commencing as it does tha 22d year of its existence. We begin the new term with energy and confidence, and assure our readers that we will do all that we can to further their intarasts by furnishing a good and readable paper in tha fntura as in the past.

Twenty-ona years is a long lifa for a newspaper to have lived anywere, but aspecially on this coast wbere such frequent and sndden changes in business occur. The same firm is pnblishing tha paper now as did so at the beginning, with the exception of tha first few montbs.

It is needless for us to inform our patrons that the PRESS has kept full pace with tha mining davelopments of the country, and that we taka a just pride in recording, year after year, fresh evidences of our success in our efforts to furnish our readers with a first-class industrial jonrnal for the progressive readers of tbis coast. Special evidences of our desire to keep fully up with the times have been given in our columns of lata. It has been our aim, and will be, to stimulate all honorable enterprises, to raise a warning voice against all wild and reckless speculations, to record passing events, to marshall in ordar all tha important discoveries and snggestions of the day wbence our readers can extract lessons of wisdom, whether in tha paths of Science or Indnstry. Our journal becomes in this way, with its faitbful record of all that is useful or instructiva, indispensahla to tbe miner, mechanic, or artisan, and a work of reference which will he sought for.

Situated in the center of the greatest mining field in the world, we devota a great share of our space to tha mining intarests of the country, giving the current news from all localities from week to week. We have paid close attention to all improvements of benefit to the industrial classes, and illustrated such new inventions as appeared to us worthy of special notice. Our efforts have naturally been devoted to the development of home industries, but in so doing we have ignored nothing abroad that would be useful at home.

We have kapt a complete and full record of Pacific coast inventions, giving weekly, as we shall continue to do, the list of patents issued in Washington, and describing in detail such as are of special interest to Pacific coast readers.

We propose to continua to improve the PRESS as occasion offers, and spare no pains in maintaining its excellenca. Our list of snbscribers has attained proportions which are very satisfactory, and our advertising patronage is of tha most respectable character, both as to styla and amount.

No person interested in mining pursuits can afford to be without the PRESS. It not only gives him tha current news, but describes all the new improvements and gives him the experiences of others in the same business. We collate from all available sources, practical information of far graater value than any subscription can he.

The MINING AND SCIENTIFIC PRESS has been in existenca long anongh to prove its worth, and to show that it fills its field properly, and we feel justified in assuring any new readers that they will without donht be satisfied in the investment of subscribing for a year. If our friends will continua to land their assistance as they have in the past, the paper will continue to improve even more rapidly than beretofore.

The State Mining Bureau.

The State Mining Bureau, which, as we have before stated, is compelled to change its quarters, as the building now occupied ia to be torn down, will he removed to 212 Sutter street. It was originally proposed to take the rooms in the front upper story of the Grand Opera house, but it was finally concluded that the location waa not central enough for convenienca.

The new quarters chosen, at 212 Sntter street, near Kearny, are quite centrally located. The first floor contains three rooms, covering an area of 30x56 ft., which will be used for general office, private office and library. On the floor above a large hall, 56x130 ft., nearly twice the size of its present room, will he devoted to the museum, being admirably adapted to the purpose by its abundant light, received through windows at either end and skylights overhead. A room in the rear will he used for laboratory purposes. Large accessions have been received and others are at the command of the museum, so that when it is finally opened to the pnblic some six weeks hence, it will be on a much more extensive scale than ever before. The building fronts south and has fine hay windows.

Mr. Hanks has had some considerable trouble in finding suitable quarters for the purposes of the museum, and at the same time getting a place where the rent was not too high. It will take some weeks to make the alterations in the building, and to place and rearrange the collection, but the operations of the Bureau will not be suspended in the meantime.

Mr. Hanks informs us that the income of the Bureau will probably he larger hereafter, as $5,000 will shortly he available, a much larger sum than was received from the collector last time. The collection of ores and minerals is rapidly growing, and the museum is fast becoming more attractive.

Oakland Harbor Improvements.

The greatest engineering work now being done on this coast by the Government is the improvement of Oakland harbor. We gave a short time since a report of progress on the work. The method of placing the rock, which we then described, is still being carried on. The training walls are fast assuming respectable proportions, and it will not now be very long hafore the whole tide flow of the harbor will he confined between the walls. The inner end of the north wall has been faced up, and both hargas are now being daily unloaded on the north wall. The rock seems exceptionally good in character, though, for the price at which the contract is taken, it is difficult to see where much money is to be made. Dredging is going on constantly, and, though the dredger seems to be in a chronic state of break-down, it does good work, when at work. At present the material is carried ont on barges and dumped in the bay. We hear, however, that arrangements are being made to deposit some of it on the adjacent shore. For this the contractor receives a higher price. The point where it is to he deposited will he on the C. P. R. R. Co.'s land, back of the freight slips.

The Government engineers have now in prospect another part of the work on this harbor improvement, which is an important one, and bids have been invited from contractors to do the work. The work to be done consists in the excavation of the flats of the tidal basin lying east of Fifteenth avenue, in Brooklyn, between low water line and the line of the marsh which forms the shore line, and in putting the excavated material *ashore*.

Here now is a chance for some enterprising persons. They can have 75 days, from the date of award of contract, to build a machine which will dredge and deliver the material ashore. Inventors of dredging appliances can here have an opportunity of proving the superiority of their devices. As most of the land near by belongs to the Oakland Water Front company, it is probable they will have no objection to having the material put asbore where it will improve their land. This remains to ha seen, however.

The part excavated is to be taken ont at least to one ft. below low water, and not deeper than 3 ft. below low water. It is supposed that the contractor can make arrangements for deposit with parties who wish to have land raised. The flats are shown by survey to extend to a height of 4 or 5 ft. above low water, sloping gently to the basin. Borings made show the material for the first 4 or 5 ft. in depth to be soft mud, which extends in places to much greater depth. In other places, the mud below is firmer, and has sand mixed with it. Bidders may choose their own place for excavation outside of the line of marsh, subject to approval and under the conditions that the area excavated shall he reasonably compact in shape and outline, having a width of not less than 500 ft., and provided it shall be made to connect with the existing low-water basin by a channel 200 ft. wide, having about 3 ft. in depth at low water.

This work, it is supposed, will ha followed by more of the same character, as appropriations become available. The amount to he applied under this contract will he what remains of funds now available after existing contracts shall be fulfilled. It will probably not ha less than $80,000, and may he as much as $100,000. No particular method of excavation is required in the specifications, and the intention is to give the contractor the fullest latitude in his operations, if this shall result in cheapening the cost of the work. The measurement of material will be in place as it now lies.

The deposit on shore will ha subject to such regulation in the way of herme or levee as shall, in the judgment of the engineers, be sufficient to prevent the material being returned to the basin. The place of deposit must, however, ha approved. The points of marsh land that make out from the two shores below Sixteenth avanna are not admissible as places of deposit. The rate of excavation required is not less than 30,000 cubic yards per month. It may he as much in excess as the contractor may choose to excavate.

Bonds to the extent of $30,000 will be required at the signing of the contract from two sureties, each qualifying in this amount.

The work will he supervised by an inspector, whose decision on any controverted points, when confirmed by the engineers, shall be final, and binding on all parties. Payments will be made monthly by checks on Assistant Treasurer United States to the amount of 90% of the work done, 10% being retained until the completion and acceptance of the work.

When this work is completed it will leave a large tidal basin at the upper end of the harbor, where many vessels can lie securely in the winter months. It is not safe for them to lie in the open bay, and Mission bay, once a favorite place, is now shut off by the bridge, the piling and the filling in. Coasters have, therefore, to go to Antioch or Oakland. The new basin will doubtless he a very useful one.

THE Salt Lake *Tribune* says that small steam yachts would do a thriving business on Great Salt Lake. At present there is nothing but sail boats to carry people to the islands and along the shores of the great inland sea.

Stored Electricity.

An exceedingly long step from the theoretical to the practical was made when that "box of electricity" was sent from France to England. Many years have tha scientific men of all countries been theorizing on the application of electricity to the purposes of every day life, aside from the important ones of telegraphing, lighting, etc. Above all things was it wanted for a motor, and now it seems, suddenly, this application is made. The box was sent to Glasgow, to Sir Wm. Thompson, having been stated to have been charged at Paris with a store of active electric energy to the amount of 1,000,000 foot-lbs. It consisted of four of Faure's batteries charged with electricity from an ordinary Grove's battery. The four batteries were enclosed in a wooden box, about a cubic foot in measurement, and weighed about 75 lbs. Sir Wm. Thomson now makes the important announcement that all that has been stated has been more than borne out by experiment. No appreciable loss could be ascertained to have occurred during the delay from transit and until the stored energy was applied to working purposes in Glasgow. One battery was detached from the other and carried to another place to supply the force for an electric cantery; and a single battery, after having been left alone for ten days, yielded to Sir Wm. Thomson 260,000 foot lbs., being some 10,000 above the original estimate. The first result Sir Wm. Thomson looks for is the use of Faure's batteries in private houses, as reservoirs of electricity for domestic purposes, such as lighting, heating, the driving of sewing machines, and many other objects.

We obtain electricity from the atmosphere by simple mechanical means, the principal expenditure being for power. Now, with a means of storing electricity, we store power; for it can be generated by wind, by running streams, etc., and saved for use when required. We thus chain up powers hitherto free from more than a passing restraint. The cost of storage does not seem to ha material in this application.

Of the hundreds of ways in which this power can he utilized, it is useless to speak. Already a tricycle weighing 400 lbs., has been propelled along the streets for an hour and a half continuously. This one practical experiment points out the way to thousands of applications.

Foundry Notes.

Pacific Iron Works.

These works have just shipped a 20-ton water jacket galena furnace for the Senate mining company, Galena, Wood River district. With it goes a complete equipment, consisting of engine, boiler, blower, etc. The plant is a very full one.

They are also building a large 40-ton furnace for a mine on the Upper Wood river, belonging to a Philadelphia company. With this are all the appliances for a sampling and separating works. The company proposa to put up separating works so as to take out the silver from base bullion and leave the lead on hand until better facilities offer for its shipment. The Richmond company of Nevada, which could not make suitable arrangements for freight, did this, and have now on hand, we are told, some 10,000 or 12,000 tons of lead.

Smelting works, consisting of a 20-ton furnace, have been made for the Sonora Antimony company, at Berkeley. They have also just finished a 30-ton copper furnace and plant for the Huachuca mining company, Silver Bell district, Arizona. They are putting up a new furnace plant for the Hacienda de la Constantia, near Alamos, Mexico. This is a 30-ton furnace.

They have built another copper furnace for the now famous Copper Queen mine, at Bisbee, Arizona, thus doubling the reducing capacity of the plant. They turned out 1,200 tons of bullion in six months with one of these 30-ton furnaces. The ore will produce an average of seven tons of bullion a day. The remarkable success of this company is largely due to the character of the ore, as it runs out of the furnace very pure, scarcely needing to be refined.

The Pacific works have sent three or four sets of hoists off to Montana, lately, and are just shipping a ten-stamp mill to the Silver Bow in that Territory. They shipped recently a chloridizing furnace and drier to the Almada and Tirite M. Co., in Sonora, Mexico. What is more notable is that amalgamating machinery has been sent to a mill in Colorado, a place from which we have hitherto had few orders.

Goss & Adams.

We examined this week, at the iron works of Goss & Adams, a pair of double-action plunger pumps of 150-horse power, and will deliver 8,000 gallons a minute at an elevation of 100 ft. They will be employed to raise salt water for surface condensers at the new California Sugar Refinery on the Potrero. The pumps are among the largest ever built on the coast. They were built under the patent granted to Mr. Dow, of this city, and he personally superintended their construction. The main peculiarity of the pumps is in the valve motion. We shall shortly give a detailed description of these pumps.

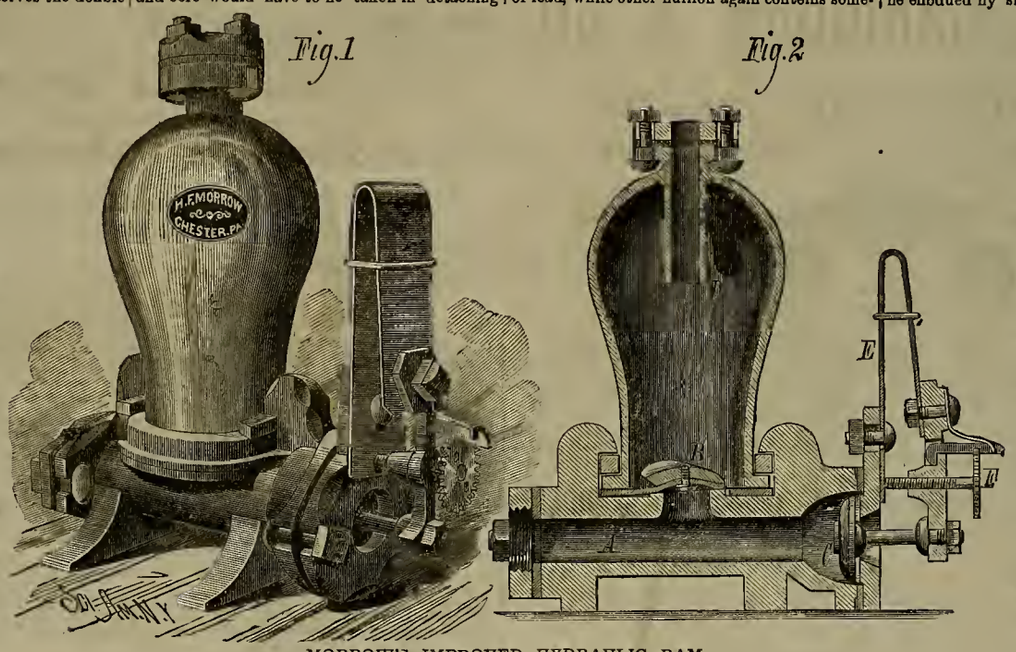
An Improved Hydraulic Ram.

A nnmber of onr readers have nssd hydranlic rams with full satisfaction in lcetions where water is abundant and snfficient fall conld he obtainsd to operate the ram. Wherevsr ths conditions are favorable there is nothing which can compare with a ram for water raising, bscanse if the dsvice be a good one it works on nnceasingly, reqniring a modicum of attention, thnmping and spirting in solitudo for months nr years sometimes. Snch hsing the value of the ram, we are wont to give attention to improvemsnts in the method of applying the principles which enter into its operation. The latest which comss to onr notice is that of H. F. Morrow, of Chester, Pa., which is shown npon this page. He has invented a ram which seems to embody every essantial fsatnre without being nndnly complicated, and is represented by the annexed engraving, in which Fig. 1 is a perceptive view showing the sxterior, and Fig. 2 is a vertical section showing the interior constrnction.

The base nf the ram has a horizontal passage, *A*, with a discharge valve, *B*, at the top, and an nvsrflow valve, *C*, at ths end. Covering the discharge valve there is an air chamber, held in place hy keye or wedgee, and farnished with a discharge pipe at the top, which projects a short distance downward and eerves the donble pnrpose of a diecharge for water and an escape for the surplns of air in the chamber. One of the greatest tronbles with all rame, aside from this nne, is the gradual increase of water in the air chamber nntil the chember is filled and the ram stops. The ram shown in the engreving airs itself, and drives off with the weter any snrplus air when the qnantity is more than sufficient to fill the epece ahove the lower end of the tuhe, *D*.

The discherge valve, *B*, ie attsched to a flep formed on a disk of leether which also forme the pecking nf the lower end of the eir ohamber. The valve is concaved to receive the head of the rivet nr holt which secures it to the leather; and the leether tonches the valve seet a short distence from the edge of the velve npening. By meene of this construction the valve is alwaye kept free from ridges, and whether or not it alwaye strikes exactly in the same place it is alwaye tight.

The overflow valve, *C*, is hung npon a cesting attached to the lower end of the spring, *E*, and its etroke ie regulated hy the screw, *F*, which beere against the hody of the ram. The screw, *F*, carries a toothed head which may he secured in any desired pceition hy a etop or pawl. This cohetruction admits of regulating the overflow valve to the 1-448th part of an inch, and effectually prevents it from jarring out of edjnstment. The valve can he regulated to meke from 30 to 300 strokes per minnte, and the ram may he adjusted so delicately ae to raise water 10 ft. on a 9-inch fall, or it may raise water 200 ft. with less than 4-ft. fall. For irrigating lands, snpplying dairies, farms, harnyards, dwellings, factories, engines, railrond etations, villages, etc., this ram seems invaluahle, as its extreme simplicity enahlee it to he set up or repaired by any one likely to nse it.



MORROW'S IMPROVED HYDRAULIC RAM.

Eureka District.—This district is now the most prosperons in Nevada. The *Sentinel* saye: Our camp is husy and hustling, and the fntnre appears brighter than ever it did before. Our minee are as yet nnly prospected; three that are worked are yielding well, and our merchants and bnsiness men are reaping the rewards of their investments and enterprise; hut few honses are marked with the ominons sign "To Let;" onr mechanics are all bnsy, and hut few idlere are found except those who would rather walk away from work than accept it when offered, or look with any energy to find it; nur hotele are well filled and restanrants well patronized, while those criterions of the prospsrity of a mining camp, the saloons and gaming tahles, are only too well patronizsd.

In the recent tendere for the constrnction of an iron hridge over the Douro, at Oporto, all the leading French firms were beaten hy the Societe Anonyme des Atsliers de Willebroeck, Belgium. The snccess nf the Inter was entirely dne to its excellent plans, which were classed first in the order nf merit, and also no douht to ite past reputation; for while its tender amounted to 2,066,000f., those nf its competitore were: Fives-Lille, 1,229,000f.; Cail et Cie, 1,539,050f.; Creusot, 1,703,000f.; and G. Eiffel, Levallois-Perret, 1,774,000f.

From last month'e operations on the Morning Star, Butte, Montana, Mr. Faraday realized a profit of $1,000 for each man employed, limited as are the present developments on that property, He employs 20 men.

The Electric Light for Mines.

We have previously given the details of the Swan electric light in nse in Europe, hnt Mr. Swan has now arranged it so as to adapt it to nndsrgrnnnd mining pnrposes. He hns exhibitsd it in the nsw form to the North of England Institnte nf Mining and Mechnnicel Engineers. Mr. Swnn said that on the principle of incan. dsscsnce yon conld divide the electric light indefinitely. He did not et first think of applying slectricity to the safety lamp. When he hegan to prodnce an economic electric light, his intention was simply to prodnce an electric lamp which wonld he gensrally applicebls; but several persons, whose opinions he conld not bnt respect, repressnted to him that the lamp in a suitahle form might be used for lighting coal mines; end these strongly expressed opinions hed led him to put the lnmp in the sheps in which it would hnve to hs for this purpose; and the ultimate result was the form of lemp which he exhihited. Improvemsnts in deteil might easily hs suggested; all he nskad now was to consider the principle of the lemp, and whether in any case it would bs applicable to the wants of coal-miners. It would be quite safe in n dengerous atmosphere, on condition thnt the glass did not hreek; another source of dnnger was the accidental rupture of the wires, and cere would have to he taken in detaching the wires. One of the main qnestions would be how far, snppoeing the lamp to give a good light, and to he comparatively safe, it wonld be feesihle to work it with the ordinary practicel operations? He was having 50 lamps made, and they would he placed in the hande of the memhers of the Acoidente in Mines Commission, and tried at a colliery in Nottinghamehire and elsewhere for lighting pit heaps; hut as a safety lamp they would he tssted in a lahoratory hy Prof. Ahel and his assistants. A nnmher of questions were asked and answered, and Mr. Swan said he thought they arrived at the conclusion, or almost at it, that it was too mnch to hope that the apparatus to generate the cnrrent could he so far reduced in size, weight, and cost, as to render the electric lamp self-contained and ahsolutely portahle. He added that there was no limit to the distance to which the electric current could he carried without serious loss, even as much as 20 or 30 miles hsiog feasihle. The President, in moving a vote of thanke to Mr. Swan, said that, seeing what changes had taken place in electric lighting, he did not entirely lose hope that we would have a self-contained and portnhle electric light.

It is not known that there are dividend mines in Georgia. The Con. G. M. Co., of Georgia, has just declared its eecond dividend of four ceuts per share, aggregating $4,000, payahle at New York immediately. Few California mines would dare offer so small a dividend as four oents per share, hut many are hold enough to go on for yeare without paying anything, hecanse they cannot pay hig dividends, and others even go eo far as to make liheral and frequent drafts on stockholders for development purposes, which often meane simply excavations in ssarch of supposed ore deposits.

According to the output of bullion from the various mining camps of the Territory dnring the last five mouths, the Arizona *Miner* is prepared to state that ehould the yield continue equally good for the next seven months, then Arizona can he marked as having given to the world 10,000,000 of money during the year. With the advent of certain railroads in 1882, then Arizona cen produce easily 20,000,000.

Roasting Ores Containing Lead.

It has not been nnly once that the mistake has been made on this coast of attempting to amalgamste ores that nught to have heen smelted, and attempting to smelt ores thet ought to have been amelgametsd. Furneces have been put up whsre mills were needed, and mills whsre furnaces were required. But the more frequent mistake has besn mede of roesting ores which had too mnch lead to admit of roesting. Leed hns a had influence in amalgemation, lixiviation, and in the roasting itself, ceusing a baking of ths nre at the slightest undus rising of ths temperatnre. Ths chlorids of lead amelgamates eesily, sspecially in iron pans. Mr. Kustel, in his "Roasting of Gold end Silver Ores," mniutains thet ores with 8% to 15% of lead will nllow of a successful roasting. A pert of the formed chloride of lead sscapss in gnseous form, another part is redncsd by degrees to oxychloride of leed. This latter comhiuation goss mostly iuto the amalgam. If there is more lend in ths ore than 15%, it gives sometimes, according to its naturo, as much as 85% of silver, and the retorted amalgem is suhmitted to cupellation in ordsr to separts the lead. If the lead is trensformed into a snlphate, it does not amelgamnte. This explaine the reason why some bullion of plumhiferoue eilver ores is free of lead, while other hullion again conteins sometimes 600 parts of lead in a thousand, according to the condition of the lead in the roasted ore. As yet no investigetiou has been made how to direct the roasting in order to convert all lead into a snlphate. Carbonate of leed as well as galena, form, under certain circumstances, snlphate, and very little of chloride of lead; sometimes it is the reverse.

Mr. Knstel gives an instance, where, in Hnngary (Offenbanya), black copper, contnining, hesides the silver, 10% of lead, was subjected to a chloridizing roasting. The pulverized copper ie mixed with 12% of salt, 1% of green vitriol, and 3% of saltpeter. The saltpeter oxidizee the lead to a enlphate, which in the eubsequent harrel amalgmnation does not enter the amalgam. Here snltpeter ie added for the purpose of oxidizing the lead to a sulphate in presence of salt. It is possihle that an addition of 50 or 60 lbs. of peroxide of manganese to a ton of roasting ore may have a great influence in thie reepect; and the conetruction of the furnace is not immaterial.

The Miners' Union at Butte, Montana, paraded on the third anniversary of its organization and had a hall in the evening. The object of the association ie not only to protect the wages of underground miners, hut to aid and assist all its members who may he incapacitnted for lahor hy reason of accident or sicknese. The wages of underground miners at the present time is $3.50 per day. While all workingmen are accepted as memhers, the wages of none are protected save those named, hut in case that any member is prevented from lahoring through an accident or hy reason of sickness, he is entitled to and will receive the sum of $8 per week. In case of great hodily injury he will receive more. At the present time the Union numhers 810 memhers.

Two Austrian iron worke have ohtained the contracts for the delivery of 19,000 tons of Bessemer steel rails and 2,000 tons of permanent way fittings required for the Servian railways. The period for delivery extends to the year 1883. A further contract of 7,000 tons of rails muet also he placed shortly, and this will probahly he ohtained on hehalf of the Austrian metal industry.

The Advantage of Perseverance.

As we have jnst passed the centsnary of the eminsnt engineer, Georgs Stephenson—June 9, 1781—it is not out of place to remind struggling young mechenics or enginssrs that this greet men did not achieve his distinction and fame without hard work, and that it wns not his gsnius alone that saved him and made him whet he was, bnt more his perseverance, ensrgy and determinatinn to snccesd. It will not do for a yonng man, becauss he supposss he hes gsnins or his friends suppose he hns, to sit down and weit for opportunity to come to him. He must mnnfully sail forward and put aside the obstacles which impede his peth, must persevere in his endssvors to perfect his knowledge and skill, nnd mnke the opportunities to use thsm. Samuel Smiles, who has writtsn a life of George Stephenson, snys of him thet for ths first 50 years of his life, he had sverything against him. He owed nothing to luck, to patronage, to ths adventeges nf edncetion. He owsd everything to bravery, intsnse conviction, and prolonged perssverance. He had to tsech himsslf sverything from the A B C to the principles of mechsnice. He hed to conquer every inch of the ground on which he stood. His conquests were not eesy, fnr arreyed against him were, first, his own ignorance which had to he enbdued hy silent, persistent endseevor; and second, the npposition of men nf knowledge and science, who etood united to oppose him and conld only be silenced by snccees. At first, Stsphenson etood almost alone in his helief in the powers of the locomotive engine. His experiments were carried on in silence end obscurity. They were qnite unknown to the journelists, historiens, and writere nf the day. The greet wnrk was done without any help from authore and orators. He never contented himself with dwelling in the regions of epeculation and abstraction. He worked energeticelly in giving life to a dormant principle, and practical reelization to en abstract proposition. Yet the facte which he developed hy experience were leughed at as "mooushine."

There is something tragic in witnessing the determined hostility which obstructed his efforts. Tho whole prejudice of the scientific world opposed him. When he invented the safety lamp he wns "pooh-poohed," and regarded as an interloper. The civil engineers opposed him to a man. He was not "nne of us," he had never received an engineer's education. They would not admit his fects. They would not even inqnire into his experiments. Everything that he proposed to dn wes demonstreted to he *impossible*. The civil engineere declered that it was impossihle to drive a locomotive at the rate of 12 miles an hour. The engine would he driven back hy the wind. If it traveled it wonld he beaten by the cenal hcats. But it conld never go at all. The smooth wheels could never "bite" npon emnoth rails. The wheels would merely turn round and round, and the whole machine would stand still. It was also declared to he *impossible* to make a railroad over Chat Moss without etopping short of the hottom. "No engineer *in his senses*," esid a distinguished civil enginssr, "would go throngh Chat Moss if he wanted to make a railroad from Liverpool to Manchester." The whole thing was declared to he "impossible." And yet the impossible things were done. What George Stephenson proposed to do, he did. The impossihle locomocive wns run, not only at 12 hut at 50 miles an hour; and the impossihle railroad was made from Liverpool to Manchester over the center nf Chat Moss.

Altogether the life of this distinguished man affords an example of what one may do hy persistent efforts, and unsuhdued energy. The moral teaching nf such a life is great, and the young men nf the day will find that as far as the means of personal progress are concerned, the means have not changed since George Stephenson's time.

Mining Watchman Murdered. — About three o'clock Saturday morning, Eyra Deljarmo was murdered in the Grass Valley Hydranlic mining clnim, near Volcano. He was employed as watchmnn on the claim, heing armed with a double-harrelled shot-gnn. His hody was found lying on the sluice hoxes, penetrated hy two rifle or pistol halls, one of which passed through the heart. Both harrels of hie gun were discharged. The robhere cleaned up some 60 ft. of the hoxes, hut how mnch amalgam they ohtained is nnknown.

Last week the famous Lexington mine, at Butte, Montana, was sold to Medhurst, representing a French company, for $1,000,000 cash. The property is considered well worth the money.

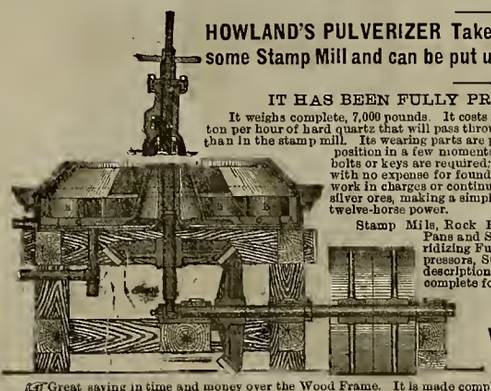
MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

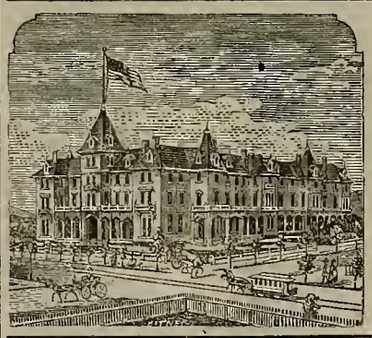
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies. Iron Work complete for Wood Frames, also

SPERRY'S
WROUGHT IRON FRAME
FOR STAMP MILLS.

☞ Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores, Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.



TUBBS HOTEL,
East Oakland,

Having been Thoroughly Refitted and Refurnished, Painted and Frescoed, is now Open for the Reception of Guests. Rooms can now be secured at the Hotel.

H. S. GREELEY, PROPRIETOR.

Excelsior Blasting Powder,
—MANUFACTURED BY—
THE EXCELSIOR POWDER COMPANY.

This is no NEW PATENT NON-EXPLOSIVE SAFETY POWDER, but the GENUINE STANDARD ARTICLE, and as safe to use and handle as any Nitro-Glycerine Powder manufactured. The Fumes and Gases, common in other Nitro-Glycerine Powders, are almost destroyed, and do not leave the miner with headache or nausea. Among the numerous recent testimonials the following is but a fair sample, constantly received, attesting the superiority of EXCELSIOR POWDER:

AUBURN, Cal., May 26, 1881.—EXCELSIOR POWDER CO.: I send you, per Wells, Fargo & Co., a box containing samples of country rock through which I am running our tunnel on the Conrad Mine, and through which we have now run 425 feet, 225 feet of it having been done with EXCELSIOR POWDER. If any one can produce harder rock I would like to see it. I here say that I can do more execution with your No. 2 Powder in this rock than I can with any No. 1 Powder of any manufacture I have ever used, and I have used every kind now manufactured here, excepting "Tonite," and I have had 20 years' experience in blasting. Respectfully yours, E. W. ROBERTS, Superintendent.

Give this Powder a trial and you will use no other. For Strength and freedom from noxious fumes, it has no equal. Address all orders to EXCELSIOR POWDER CO., No. 330 Pine Street, Rooms 53 and 54, Academy Building, San Francisco, Cal.

IRRIGATION! LAND RECLAMATION!

Also on hand and for sale A FULL LINE OF MILL AND MINING SUPPLIES.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR.
Over 250 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and the concentrations are clean from the first working.
The wear and tear are merely nominal; the water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.
ADAMS & CARTER, Agents, Room 7, No. 109 California Street, S. F.

SHINOLE MACHINES AND SAW MILL MACHINERY, STEAM ENGINES, ETC., TO ORDER. MINING MACHINERY OF ALL KINDS.
F. A. HUNTINGTON,
220 Fremont Street, San Francisco.

DuBOIS' Automatic Quicksilver Feeder.
A machine for feeding quicksilver to the mortars of GOLD MILLS. It is so connected to the cam shaft, that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a mechanical movement, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding ordinary hand-feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect. Price complete, $100.00. Send for circular.
P. C. DuBOIS,
18 Fremont St., S. F.

Scientific and Practical Books on Mining, Metallurgy, Etc.
Published or issued wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.
BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.
Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.
This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, $7.50
ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.
This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.
It contains 155 pages, embracing illustrations of furnaces, implements and working apparatus.
It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.
Price, $3.00 coin, postage free.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.

FOR THE WEEK ENDING JUNE 21ST, 1881.

243,053.—TALLY BOARD—H. J. Baddeley, Napa, Cal.
243,202.—OIL STOVE—B. C. Brown, S. F.
243,136.—DRY PLATE HOLDER FOR PHOTOGRAPHIC CAMERAS—J. M. Howe, S. F.
243,071.—POCKET KNIFE—A. Keyser, S. F.
243,160.—FANNING MILL—Thos. R. Rosier, Dayton, W. T.
243,161.—LATCH—J. W. Ross, Santa Clara, Cal.
243,321.—HARROW—Geo. S. Spring, Willows, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign, Patent Agency, the following are worthy of special mention:

SOFA BED.—Frank Laeremans, 525 Washington street, San Francisco. Dated June 14, 1881. No. 242,941. The patent which covers this invention, though modest in title, really covers several in one. It relates to that class of furniture which combines the sofa with the bed, wherein the back of the piece of furniture folds forward on the arms. It consists in a pair of grooved arms and a shifting back, provided with studs entering said grooves, and upon which the back swings in combination with projecting rails secured to the ends of the back, and which sustain the back when it is in a horizontal position to act as a bed. When used as a sofa, it looks like one—and is one; when used as a bed, it is a good wide one on a firm foundation. The user does not lie on the upholstering, but on the ticking, and this is made with slates like a regular mattress. With it is a movable frame for mosquito bars. Another combination of this principle is the sofa and operating table for the use of physicians. In one position, it is an office sofa; in the other, an operating table, with all necessary appliances, and so made as to take the patient in any position. Many of these have been sold, and for country physicians they are excellent. The combination is also formed as a chair and a crib. During the day-time it is a good easy-chair for bed-room use. At night a single motion makes it a crib, the side unfolding and being properly held in position. The most peculiar arrangement, however, is the sofa and table in combination. The back of the sofa, when tipped over horizontally, makes a table capable of extension. Its edges project over sufficiently to allow room for the limbs under the table. The end-leaves draw out and admit of inserting any number of leaves. This is a very useful arrangement for residences, steamers, etc., being very convenient. The frame can be made in black walnut, but a cheaper form is, of course, in pine. For sitting-rooms in the country this is handy, the table being out of the way when not in use, and being, at the same time, available as a sofa. A 6-ft. sofa makes a 12-ft. table. The slide is peculiarly arranged so as to leave no chance to get out of order.

POCKET KNIFE.—A. Kayser, S. F. Dated June 21, 1881. No. 243,071. This invention relates to that class of pocket knives the novelty in which is the peculiar construction of the handle and arrangement of the blades, whereby the said blades may be easily removable, and contained complete within the handle when not in use and pushed out therefrom when required, being held in place to prevent their unexpectedly closing up and hurting the hand. The object of the invention is to provide a knife, the blades of which can be easily removed and others substituted, and which, when not in use, will be convenient and harmless, the blades not being able to open in the pocket, and when in use will be held firm and rigid, the whole knife being substantial and not likely to get out of order.

HARROW.—Geo. S. Sperry, Willows, Yolo county, Cal. Dated June 21, 1881. No. 243,321. This is a peculiar sectional harrow, the two parts of which are connected by peculiar links, with notched or corrugated surfaces which give to the two sections a zigzag or vibratory motion and conform them to the character of the ground. An extended heel, or tube, carrying the teeth, is journaled on the frame; these teeth revolve between the interstices of the frame timbers, and are long enough to cut the straw or stubble beneath.

OIL STOVE.—B. C. Brown, S. F. Dated June 21, 1881. No. 243,202. This invention relates to an oil stove for heating and cooking purposes, the novel features of which are the details of construction of the oil-holding tank. The construction of the stove makes it possible to warm the room at the same time a cooking vessel is used.

What they Say about Us.

We append a few of the "notices" which we have received from our exchanges:

THE following we take from the Tucson *Journal*, the official paper of Pima county, Arizona, and one which ably represents the mining interests of the Territory: Interesting.—The MINING AND SCIENTIFIC PRESS of June 18th inst., is a magnificent 36-page edition, with a vast amount of interesting matter relating to the Territory of Arizona. Accompanying the edition is a map of the Territory, engraved from Riecker's of last year, with added corrections and additions. Besides the map there are illustrations artistically executed, exhibiting objects of historic interest, among which are the painted rocks of Arizona, etc. The PRESS contains a number of well and carefully written and condensed articles on the climate, productions, mineral and agricultural, of the Territory, original and selected, which may be read and acted upon with entire confidence in their truthful accuracy.

THE MINING AND SCIENTIFIC PRESS, of San Francisco, comes to us this week in the form of an Arizona extra, containing 36 pages, devoted principally to mining news of Arizona. A correct map is enclosed, showing the location of all the cities, rivers, districts, mines and railroads in the Territory. It is a magnificent number, and should be read by every one in search of information concerning Arizona.—*Globe Chronicle, June 23.*

WE have received the Arizona edition of the MINING AND SCIENTIFIC PRESS. It consists of 36 pages, and is an excellent number. In it we notice a letter from Prof. Lemmon, and another from Rev. Messenger. The PRESS is a good journal, and its columns show that it is prosperous.—*Phœnix Herald, June 24.*

Miners' Meeting at Sweetland.

At a large and enthusiastic meeting of the miners and citizens of Mississippi Valley mining district and vicinity, held at Sweetland, Nevada county, the following preamble and resolutions were adopted:

WHEREAS, We view with mingled concern and alarm the recent action of an interested and prejudiced court of a neighboring county, in issuing a restraining order, perpetually enjoining the miners of this county from the customary use and working of their mines in the manner indicated by the nature thereof and the conditions under which the same exist, as an attack upon the enjoyment of a natural right and fraught with great immediate injury and danger, not only to the mining interests of the county and the citizens thereof, but to the State at large, tending to adverse influence upon the national finances involving among the first sufferers of a deplorable success, the very interest in behalf whereof such attack is ostensibly made, for the cogent reason that a cessation or marked decrease of gold product heretofore flowing in the channels of trade, must inevitably unsettle values and create a depression in the price of cereals and other staple products of this coast. Therefore,

Resolved, That we view without any sentiments of jealousy the occupation and use of the rivers and streams of the State to the development and working of mines within its borders, as bearing most important relation to local, State and national interests. That we deprecate as most unwise the policy heretofore adopted by too large a proportion of the mining interest of the country, in substituting Chinese labor in part or any capacity for that of the Caucasian race, upon which latter must necessarily devolve all the duties and responsibilities incumbent upon the American citizen. That such policy has in no small degree impaired the interest and sympathy which should be extended to the mining interest, reduced the ratio of our representation in the Legislature of the State by discouraging the influx of an intelligent white labor element and compelling that formerly part of our population to seek other fields of employment, thus retarding the collateral growth and development of other resources and property interest and consequently increasing the burdens of taxation.

Resolved, To the end that the results of the policy above mentioned may be obviated as much as now possible, we ask the several managements of the various mining interests of the county, in good faith to pledge and promise to refrain hereafter from employment in any manner or in any capacity whatever of Chinese labor, and, in lieu thereof, to employ none but white labor in the mines of this county, and that we do hereby accord the mining interest our full sympathy and support in combatting the late restraining order issued out of the Rancher's Court, and we, calling upon our fellow citizens for moral support and physical aid, do hereby pledge ourselves to sustain the mining interest by all means in our power to the bitter end in assertion of a natural right against all action emanating from illegal sources tending to subvert and destroy such natural right, and in this spirit we ask the meeting to be held at Nevada City, in behalf of the mining interest of the county, to endorse and sustain the sentiments of these resolutions.

Resolved, 3d, That copies of these resolutions be transmitted to the press of the county for publication.

G. N. L. POWELL, Chairman.
FRANK N. WOOD, Sec'y.

Powder Explosions.

A powder magazine blew up at Tucson on the 27th, ult., which did a good deal of damage, but killed no one. From the associated press dispatches in the *Chronicle*, we take the following items:

The magazine belonged to William Zeckendorf & Co. and L. Zeckendorf & Co. The magazine was located one mile from the town. A member of the firm of L. Zeckendorf & Co. informed me that the magazine contained 1,000 cases of Hercules and Tonite powder, but it is generally believed that there was much more. Many persons sustained slight wounds from falling doors and glass, but no serious wounds have been reported. Many residences in the northern part of town are almost ruined. The doors and windows are torn from their fastenings, the plastering is shaken off and the walls badly shattered. Several houses took fire from the explosion or the breaking of burning lamps, but with no serious results so far as now known. The damage must be great, as nearly every house and building in town is more or less injured.

Last Sunday morning the powder mill at Clark's Landing, Alameda county, was destroyed by fire, and three men were seriously, but not fatally burned. The works were owned by the Alta Chemical Co., who manufactured a peculiar kind of powder for mining purposes. The building consists of two rooms, one of which is used for storing the powder and the other for manufacturing it. Charles Anderson, the engineer, was in one of the apartments hammering on some steel, when a spark lighted on his vest and set it on fire. Losing his presence of mind he threw the vest off, upon a heap of powder lying on the floor, which ignited without an explosion and set the buildings on fire. Prof. Monnier, the manager, and his son, barely escaped with their lives, as they were instantly surrounded by fire and had to grope their way through flames and blinding smoke. As it is, their hands and faces are seriously burned. The loss on the building, stock and machinery amounts to $6,000. The company will resume business as soon as the building can be restored

Hygienic Science Made Popular.

We all of us want to understand how these human frames are built, and what the different parts are good for. How to keep the live machine in running order; save it from every harm avoidable; repair it, when injured, at least expense, and get the best results from its harmonious working.

This want is better satisfied by Dr. Kellogg's "Home Hand-Book" than by any other work we know of. In the light of recent and trustworthy researches, and in a clear, forcible, entertaining style, he explains the structure and uses of the various organs, and states the laws and conditions of health. Causes of disease and how to avoid them receive special notice. Great stress is laid on heeding the first departures from health and nipping illness in the bud. The principles of rational medicine are set forth lucidly, and their application to disease is intelligible and practical. People of common capacity are thus enabled to adopt simple measures of treatment when a physician is not at hand or need not be summoned; to discern when professional services are really necessary, and, in the latter case, to discriminate between the wise, reliable doctor and the charlatan.

The chapters on diet, dangerous adulterations of food and how to detect them, stimulants and narcotics, drainage and ventilation, together with the plain, emphatic warnings against every species of reckless drugging, are timely and valuable. There are full instructions, also, what to do in case of accident—drowning, sunstroke, poisoning, etc. The cuts are numerous and generally good; the print is large and pleasing to the eyes; the binding calculated to stand service in a studious family.

Dr. Kellogg himself is a member of the Michigan State Board of Health, and highly esteemed for scientific attainments and professional skill, as well as energy, moral integrity and human ambition to do good.

A full table of contents and copious indexes make ready reference easier and increase the practical worth of the volume. Believing it to be the best work of the kind in print, we hope it will find its way into and bless many California homes. It is published on this coast by the *Pacific Press* Co., of Oakland.

News in Brief.

THE emigration from Denmark this year is estimated at 70,000.

THE iron foundry and machine shop at Yreka were destroyed by fire Saturday.

THE track of the Southern Pacific is now laid 22 miles east of El Paso, Texas.

THERE is a prospect that a Signal Service station will be placed on Mount San Bernardino.

THE trouble between the Italians and French still continue, and serious results are not improbable.

THE Richmond and Alleghany, Atlantic and Northwestern and Ohio Central railroads have consolidated.

AT rifle practice the regulars of the Presidio defeated a picked team, Saturday, at 200, 500 and 600 yards.

AN investigation into the affairs of the State Prison at San Quentin is to be had, at the request of Warden Ames.

A FIRE occurred in the San Quentin prison in the California Door Co.'s dry-house on the 25th ult. Not much damage was done.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. F. OSBORNE—San Francisco.
A. C. KNOX—Napa and Lake counties.
G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Yuba and Sutter counties.
D. W. KELLEHER—Solano and Sacramento counties.
GEO. W. FAHRION—Plumas county.
GEO. H. HOPKINS—Amador county.
A. LEONARD MEYER—Utah and Idaho Ter.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We will send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

ANDERSON SPRINGS, in Lake county, 19 miles from Calistoga (over a grand, picturesque route, via Mt. St. Helena) are among the best in this State. They are situated in the midst of a natural park, full of beauty and interest to the naturalist. Good home-like accommodations at reasonable rates are invariably furnished by the Anderson family.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

THE State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

Adams' Spring.

"The Best."

By many who have well tested the Adams and other Springs for Dyspepsia, Rheumatism, Kidney, Liver and other kindred diseases, the cool palatable water of this spring is declared to be SUPERIOR. Persons unacquainted, who wish to make sure of striking the best water first, should inform themselves as to the merits of the Adams' Springs by inquiry of those well posted, or by sending to the proprietor for a copy of the thoroughly reliable analysis made of this water, and reference to trustworthy persons, who have practical knowledge of its well authenticated virtues. Situated four miles from Glenbrook P. O., Lake County, Cal., surrounded by beautiful hills covered with Pine, Spruce and other mountain timber. Comfortable accommodations and good board at very reasonable rates. E. R. MOSES, PROPRIETOR.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Arizona Mexican Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Globe District, Arizona.

Notice is hereby given, that at a meeting of the Directors, held on the 7th day of June, 1881, an assessment (No. 1), of Fifty (50) Cents per share was levied upon the capital stock of the Corporation, payable immediately in U. S. Gold Coin, to the Secretary at the office of the Company, Room 39, No. 320 Sansome St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of July, 1881, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 8th day of August, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

GEO. R. ADAMS, Secretary.
Office—320 Sansome St., Room 39, San Francisco, Cal.

ANNUAL MEETING.

GOVER MILLING AND MINING COMPANY.—The regular Annual Meeting of the Stockholders, for the election of a Board of Directors, will be held on Tuesday, June the 14th, 1881, at 2 o'clock, P. M., at the office of the Company, No. 402 Front street, Room 8, San Francisco California. W. O. WILSON, Secretary.

Steep Hollow Gold Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Liberty Hill Mining District, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of June, 1881, an assessment (No. 6), of $1.50 per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of July, 1881, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the 18th day of August, 1881, to pay the delinquent assessment together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. PEW, Secretary.

Office—310 Pine St., Rooms 15 and 17, San Francisco, Cal

DEWEY & CO.'S
Scientific Press Patent Agency.

[ESTABLISHED 1860.]
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

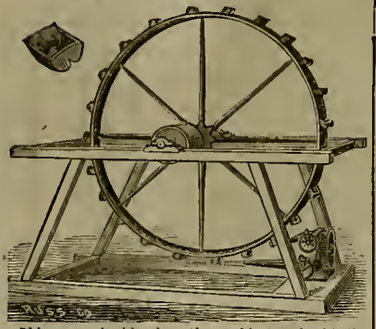
Hoisting and Pumping Machinery.

THE PELTON
WATER WHEEL.
(Patented, Oct. 26, 1880.)



This water wheel has been thoroughly tested with the Dynamometer, and utilizes 78% of the theoretical power; and underheads of water of 75 to 800 ft is guaranteed to give better satisfaction than any Turbine or other wheel ever offered to the public. The above per cent. is due to the peculiar shape of the buckets used. They do not reduce the water to a spray, but divide and deflect it outward and backward, in such a manner that a part of the impact and the whole reactionary force are utilized, without any part of the water coming in contact with the bucket following. Furthermore, the per cent. of efficiency remains constant through great variations in the amount of water used. These buckets can be taken off in transportation, and can be replaced by new ones when worn out by sand in the water; also can be applied to wooden wheels when desired.

SAN FRANCISCO, SATURDAY, JULY 9, 1881.

VOLUME XLIII Number 2.

Destroying Base Metal Chlorides.

In roasting ores it is very difficult to get rid of all the base chlorides. They are formed under the action of chlorine and hydrochloric acid. The most of the metal chlorides are volatile, and a part is carried off through the chimney. Another part of the chlorides gives off some of its chlorine, whereby sulphates, undecomposed sulphurets, antimoniates and arsenates are chloridized. Chlorides, which are disposed to transfer chlorine to other metals in combination with sulphur or arsenic are: The protochlorids of iron and of copper, the chlorides of zinc, lead and cobalt. When, in this way, the most of the metals are chloridized, the base metals, principally iron and copper, are losing their chlorine gradually, being first converted into sub-chlorides, and then into oxides.

Mr. Kustel, in his "Roasting of Gold and Silver Ores,"* says that the roasting for the purpose of destroying base metal chlorides must continue with increased heat, even when the chlorination of the silver is finished. At an increased heat, the base metal chlorides lose their chlorine, while the chloride of silver remains undecomposed, unless a very high temperature should be applied. This process requires a long time, consequently also more fuel. The decomposition of these chlorides is greatly assisted by the use of 5% to 6% of carbonate of lime in a pulverized condition. Lime does not attack the chloride of silver, but it is not advisable to take too much of it, as it would interfere to some degree with the amalgamation. The pulverized lime rock must be charged toward the end of the roasting. First, 2% is introduced by means of a scoop, the whole well mixed, and then examined either with sulphide of sodium, or in the following way:

A small portion of the roasted ore is taken in a porcelain cup or glass, and mixed with some water by means of a piece of iron with a clean metallic surface. If the iron appears coated red with copper, some more lime must be added. In place of iron—especially if no copper, but some other base metal is present—some quicksilver is mixed with the sample. In the presence of base metal chlorides, the quicksilver is coated immediately with a black skin.

When endeavoring to expel the base metals by heat, the loss of silver, in presence of much antimony, lead and copper, should be investigated very carefully. Under certain circumstances it is not uncommon to find a loss of even 50% of the silver, if the chloridizing roasting is carried on at a high heat for a great length of time. The loss increases with the duration of roasting and with the degree of temperature. When such ore is under treatment, it is necessary to take samples during the roasting, and to examine the same for the amount of chloride of silver, and also for its loss, and to stop roasting when the highest percentage of chloride of silver is obtained without reference to the condition of base metals.

*For sale by Dewey & Co. Price $3.

THE FOURTH OF JULY.—As a rule, the Fourth of July celebrations in the larger cities throughout the country were laid aside, out of respect for the President in his affliction and in harmony with the feeling of grief which pervaded the country. Instead of rejoicing, there was suspense, anxiety and solicitude. It was fitting that the day should be memorable by the omission of celebrations. If the President recovers, there will be a general disposition to rejoice, and it is proposed to carry out the plans laid in this city in the celebration of Admission Day, September 9th. It strikes us this would be a very good arrangement.

THE FIRE FIEND has again broken loose in the grain. On the Fourth there was a destructive grain fire on Glenn's Montgomery ranch, 14 miles above St. John. About 2,000 acres of wheat were destroyed, and 12 or 15 stacks. About 400 men fought the fire for hours. No insurance. It is said to be summer fallow wheat, about 25 bushels to the acre.

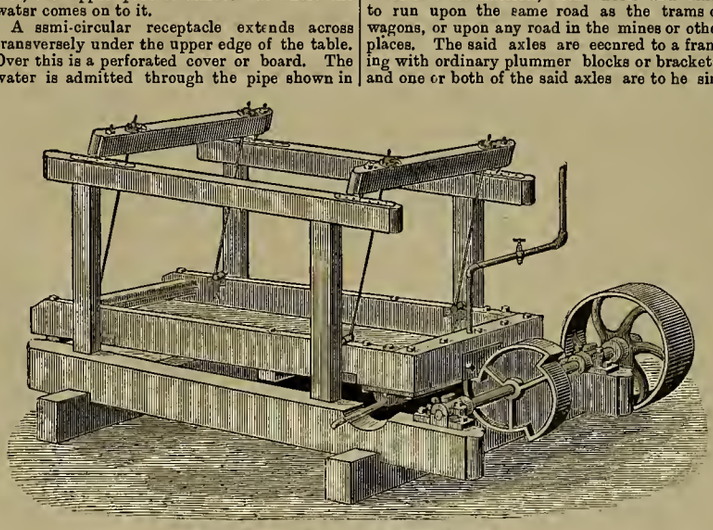
A New Concentrator.

We present on this page an engraving of the National concentrator, a new metallurgical appliance invented by Stephen Kendall, of this city, and for which he has applied for letters patent. The peculiarity of the concentrator lies in its power of not only concentrating the ore, but in separating from the concentrations the amalgam and particles of mercury, depositing each in a separate place.

It is built very substantially, is easily transported and can be run by hand, or direct from a main shaft without the use of pulley and countershaft. It is easily regulated according to the quality of pulp that is to be concentrated, and requires no skilled labor in either running it or setting it up.

As will be seen, the machine is like an ordinary percussion table. The lower portion of the table has more of an incline than the upper; in fact, the upper part is almost flat where the water comes on to it.

A semi-circular receptacle extends across transversely under the upper edge of the table. Over this is a perforated cover or board. The water is admitted through the pipe shown in



THE NATIONAL CONCENTRATOR.

the engraving, and is led down under this perforated cover, up through the perforations of which it flows smoothly and without any rush, or wash, or sudden flow. It then flows smoothly on, meeting the upwardly moving heavier particles, and sending the lighter portions down and away.

The heavier particles come on up, the jar of the machine moving them, until they pass through the perforations into the receptacle. The sulphurets can then be withdrawn from the tube shown in the engraving.

This tube or opening is not made exactly at the bottom of the receptacle, but somewhat above it. Therefore the amalgam, quicksilver and heaviest substances do not come out of the discharge when the sulphurets do, but remain there. When removed they are therefore separate. This machine therefore admits of continuous discharge both of the tailings and the concentrations, as will be seen from what we have said. The method of hanging the table is very good. It is hung out of the center so that no springs are needed to draw it back to the position where the cam wheel which gives its movement, will strike it.

All the bearings of this machine are well made. It is light and portable, and costs but $250. One of them may be seen in operation, corner of Main and Howard streets, in this city, at the National Iron Works, Marshutz & Cantrell, who are the sole manufacturers. The machine is now in operation at a quartz mill in this State, and Mr. Kendall informs us that it is doing very satisfactory work indeed. Mining men will do well to call and examine the machine in this city.

CYCLONE at Poughkeepsie, N. Y., on the 5th.

A Spray for Mine Galleries.

An invention which has for its object the prevention or mitigation of explosions in coal mines has lately been patented in England. It consists of an apparatus for automatically watering the galleries of the mine, and so laying the fine coal-dust which floats in the atmosphere of dry collieries and has so frequently contributed to, if it has not actually caused explosions of the most destructive kind. The inventors are well known. Mr. Kirkhouse holds a leading position as a mining engineer, and Mr. Lewis, of the Tredegar foundry, is already favorably known by many successful inventions. The present invention is thus described in full: "As the coal and other dust in the air in mines has been proved to be explosive and otherwise injurious to workmen, hence our invention. It consists of a cistern or cisterns carried upon a framing made of wood, iron, or steel, or any other suitable material, with wheels and axles to run upon the same road as the trams or wagons, or upon any road in the mines or other places. The said axles are secured to a framing with ordinary plummer blocks or brackets, and one or both of the said axles are to be single or doubled cranked, or fitted with eccentrics, from which a pump or pumps can be driven either full or empty as the tank travels along with the journeys through the mines and other places. The said pump or pumps are driven by the said cranked axle, axles, or eccentrics, and fed from the tank. At either end of the tank is fixed a circular pipe perforated with small holes or other openings, which are supplied with liquid from the pump, and forme a complete jet or spray as the tank travels, thereby laying the dust which is suspended in the air. The pump or pumps are fitted with a balance relieving valve and stopcock, so that the liquid can be worked through the pump and back into the tank without forming a jet or spray in case it should not be required, and thereby saving the liquid while the tank is still in motion." Such are the details of a patent which combines simplicity with power. It is a step, and a successful one, towards the prevention of the distressing accidents which periodically desolate coal districts. It will be useful in the mines on this coast for carrying fumes of high explosives.

MILL SITES.—Section 2 of the act of Congress approved January 22, 1880, entitled "an act to amend sections 2,324 and 2,325 of the Revised Statutes of the United States concerning mineral lands" does not apply to mill sites located separately or in connection with lode claims. No annual expenditures are required to maintain possessory title. This statement is made in reply to a "Nevada reader of the Salt Lake *Tribune*," and the reply is as given by the Acting Commissioner of the General Land Office to the correspondent of that journal.

Locating Coal Lands.

L. H. Bowers, Esq., of Austin, Lander county, Nev., asked the Department permission to renew a coal filing upon a certain land, the situation of which is not stated. The Acting Commissioner of the General Land Office, in reply, says: It is contrary to the rule of this office to permit a second filing upon the same land. If a second could be allowed, so could a third and fourth, and thus the disposition of the land could be indefinitely postponed, a condition of things not in accordance with public policy.

J. W. Rowley, of Colorado, asks that he be allowed to relinquish coal declaratory statement and make preemption filing for the same tract; and, as it appears from the affidavits presented that the land is not in part valuable for coal, and accordingly the Department directs the Register and Receiver to allow the preemption filing.

Edward S. Aiken, of Hawlon, Pecra county, Arizona, propounds the following: "A certain coal field, extending for about four or five miles in length and about one mile in width, has running through its entire length, a small strata of silver-bearing rock, which will carry $5.12 to the ton. Will the land have to be located as bearing gold, silver or copper? Is it subject to pre-emption for coal lands under Section 2,347, et cetera?"

The acting commissioner's reply, says: The land (inasmuch of it as contains the silver) must be located under the mining act of 1872. Under the regulations of this office, founded upon Section 7 of the Coal Act, the claimant under that act is required to testify to the non-existence (as far as his knowledge goes) of any vein of gold, silver or copper, which would be manifestly impossible in the present case. But if the land were located under the mining act, locators would be entitled not only to the silver vein located, but also to all other valuable deposits within their location and would get title to the land at $5 per acre instead of $10, the price demanded by the Coal Act. The remainder of the tract would then be necessarily located under the Coal Act and paid for in accordance with its provisions.

Taste and Odor of Minerals.

In their action upon the senses a few minerals possess *taste* and others under some circumstances give off *odor*. Taste belongs only to soluble minerals. The different kinds of taste adopted for reference are as follows:

1. *Astringent;* the taste of vitriol.
2. *Sweetish astringent;* taste of alum.
3. *Saline;* taste of common salt.
4. *Alkaline;* taste of soda.
5. *Cooling;* taste of saltpeter.
6. *Bitter;* taste of epsom salts.
7. *Sour;* taste of sulphuric acid.

Excepting a few gaseous and soluble species, minerals in the dry unchanged state do not give off odor. By friction, moistening with the breath, and the elimination of some volatile ingredient by heat of acids, odors are sometimes obtained which are thus designated.

1. *Alliaceous,* the odor of garlic. Friction of arsenical iron elicits this odor; it may also be obtained from arsenical compounds, by means of heat.

2. *Horse radish odor,* the odor of decaying horse-radish. This odor is strongly perceived when the ores of selenium are heated.

3. *Sulphureous,* friction elicits this odor from pyrite and heat from many sulphides.

4. *Bituminous,* the odor of bitumen.

5. *Fetid,* the odor of sulphuretted hydrogen or rotten eggs. It is elicited by friction from some varieties of quartz and limestone.

6. *Argillaceous,* the odor of moistened clay. It is obtained from serpentine and some allied minerals, after moistening them with the breath; others, as pyrargillite, afford it when heated.

The feel is a character which is occasionally of some importance; it is said to be *smooth* (sepiolite), *greasy* (talc), *harsh* or *meager*, etc. Some minerals, in consequence of their hygroscopic character, *adhere to the tongue*, when brought in contact with it.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Bishop Creek Mines.

Editors Press:—I have the pleasure of announcing the sale of ths Pajaro mine, the rich gold mine that I mentioned in my last. The transfer was made on the 25th ult, W. H. Lent, Jr., purchaser; considsration, $30,000. Mr. Lent was here in person, and is very fortunats in gstting possession of the propsrty. I understand he has left orders for the further prosecution of the work of development, with a view of ascsrtaining the extent of the ore body, and the size of reduction works needed. The shaft is down now 100 ft, and the ore will mill at least $75 per ton.

The people of Biehop Creek are very juhilant over the transfer, as all well know that where snch men ae Lent take hold, it means prosperity and revival of business. There is much more mining property here quite ae good, and it is truly an inviting country for the investment of capital. Concord.

Trout Ponds.

Editors Press:—Within three miles of Nevada City an old-time miner ie hard at work, utilizing the free waste water from springs and tunnele. The conformation of the ground favors the construction of lakelets and reservoirs, at trifling outlay of labor and money. The overflow passes hy three gates through wire screens, falling upon rock, and at present is conducted away through eide ditchee into a natural water channel. Ahont midway the length of the lakelet, a little island with yonng trees remains. Sometime it will have a rustic summer-house, and heds of hright flowers. This will create a desire to row, and necessitate a boat. This in turn will he a home attraction and amusement to each memher of the family.

At one of the side gatee the proprietor has constructed a feeding place 10 ft. in diameter, from which the water can be drawn. Thie he eays will enable him at pleasure to assort, count or divide the fish. In thie are little piles of emooth, white rocks. The baby fish were evidently familiar with the presence of their friend the owner, and in large numbers were waiting to he fed. He dropped clahhered milk into the still water npon the rock piles. Instantly, from the shady nooks they came by the thousand, until the water was thick with them. At our elightest movement, even at a ehadow on the water, they would scatter, frightened away, as rapidly as they came. The banks abont the feeding place are semi-circular and terraced one above the other. These are to have the eidee sodded, and the walks graveled. To accommodate the friends who may, as we did, seek the place to learn the habits of the speckled heauties, henches are to he placed there. The stock is young, consisting of 2,000 land-locked ealmon and 8,000 trout. The owner says that in three monthe those that came to the feeding placee have grown from the length of a grain of harley to two inches. At sundown, emall ae they are, their leaping out of the water after insects is a lively and intereeting eight.

As rapidly as possihle the series of excavations will he continued to make room for the increasingly large family. The intention ie to have nine of these narrow deep lakelets, fed hy pure spring water. The capacity of each to be from 8,000 to 10,000 fish. These lakelets are independent of natural water courses and hence not liable to he washed out hy spring floods. The gentleman has the help of two half-grown lads. The work is all done by hand, with aid of pick, shovel, amd wheel-harrow.

There is a possibility of fountains and a desr park. A long eide hill containing 40 or 50 acres overlooking thie eeries of lakelets can easily be fenced for that nurpose. Magnificent forest trees and clumpe of lilacs are ecattered over it. The eparkling waters can he conducted in an open ditch along the higheet line of this hill, and then be piped across to the lower hill for domestic and irrigating purposes. To date, not a drop of water has been carried on to the garden, hnt young fruit trees and emall fruits are growing thriftily within a ehadow length of pine trees 100 ft. high.

A four-roomed, two-story house last spring took the place of tbe miner's cahin. Wife and children, hooke and magazines and refinemente have come from town to share the amhition and give light and love to the willing worker. These people have a U. S. title to the land, but have very little money. How they manage to make expenses we will tell in our next.

Mrs. C. F. Young.

Nevada City, Cal.

A Notable Aerolite.—The State Mining Bureau has acquired the "Chilcat" meteor, so named becauee it was seen by the Chilcat Indiane of Alaska to fall, 100 years ago, and has heen preserved hy them. It is an aerolite, weighing 1,600 ounces, and was brought to the notice of Prof. Hanks hy John Muir, the well-known ecientist, some eight months ago. Through the Northwest Trading company, the Mining Bureau succeeded in negotiating for its purchase.

The Microscope in Geology.

The following paper of Melville Attwood, Esq., was read before the San Francisco Microscopical Society, June 13, 1881, "On the Gsology of Bodie, Illnstrating the Two Ages of Gold:"

At the time of the orgsnization of this association, ths subject of this paper, "The Geology of Bodie," might have hesn considered ill-suited to and out of place before a microscopical socisty. But at that time the microscope in geology may he said to have hsen quits in its infancy, and even at the pressnt time we are looking forward to great revslations hy its more extended applicstion.

The portion of that hranch of geology which the lats Mr. Jukes defined as "gsognosy," which is of real importance for *industrial purposes*, is that which inclndes the mineral composition and structure of rocks, such as csn he determined in the laboratory by the aid of hand specimens, and is termed "lithology" (etone lore). The use of the microscope in the hands of some of onr most eminent geologists, and the reeulte obtained by them from it, have proved this instrnment of research to be of the greatest value, or I may say, to be absolutely indispensable in that branch of geological investigatione just mentioned.

For the past eight yeare I have devoted a large portion of my time to the etudy of the walls or enclosing rocke of metalliferous veins, and have made minute and careful investigations of them, hut without the microscope my lahors would have heen of a most unsatisfactory character, as rocks of eedimentary or etratified deposits have the same chemical composition as those of an intrusive nature, and can only he distinguished hy the aid of the microscope. Eruptive rocks, for instance, whatever be their age, nnder microscopic examination exhihit certain definite charactere distinguishing them at once from all othere. No one on this coast is better able to bear testimony to the correctness of this statement than onr State Mineralogist, Mr. Hanks. I think I may venture to remark that no mining engineer'e or expert's report on mines can be fairly relied upon unless he is able to distinguieh the true character of the enclosing wall-rocks, and this he cannot do unless he

Understande the Use of the Microecope.

The exact methods of investigation demanded at the present day, will only regard snch terms as "favorable information," etc., as expressions of comparative ignorance, and the reputation of those using them must euffer greatly. A knowledge of the proper place for sinking shafts, driving drifts or crosscuts, is quite as necessary as to know how to use the pick, gad, drill and shovel, and I may say that the money that has been thrown away on the Comstock alone for want of euch a knowledge, would have built up manufactoriee in California that would have made it the envy of the whole world. Now, with respect to gold—aurifer-ons lodes or veine are not characteristic of any sedimentary etratnm or formation, bnt are alwaye met with in conjunction with the outburst of eruptive rocks, hoth plntonic and volcanic (I use the old classification of eruptive rocke, "plutonic, old; volcanic, new;" thongh I am well aware that evidence can he adduced to ehow that they graduate into one another, and consequently that it is more hypothetical than real), as representing, in my belief, a very marked and real distinction in the ages of the gold contained in the rocks; and I hope to ehow that the condition of the gold demonetrates clearly the character of the enclosing rock of the lodes or veins from which it was obtained. The gold of the first age, or that found in connection with plutonic rocks, being only elightly alloyed with silver, whilst that met with in the second age has, in some instances, been found to contain nearly 50% of silver. So that the condition of the gold in nearly every case I have examined has correctly indicated the

Character of the Enclosing Rocks

Of the lodes; and on the other hand, the etndy of the enclosing rocks has told me the condition of the gold I should be likely to meet with in them. Speoimens of gold accompanying this paper, which came from Grase Valley and Bodie, are rolled out into thin strips to show and illustrate the marked difference in the appearance of the two kinds.

I have carefully stndied this matter, and a collection of gold and wall rocks from nearly every part of the world confirme the correctness of these conclusions, which I believe to be of univereal application.

The gold in metalliferons *belts*, like that of the Comstock, which followe the contour of the east side of Mt. Davidson, or in the metalliferons channel of Bodie, which runs along the center of the ridge from Bodie Bluff, each contain a uniform proportion of eilver alloyed with gold, from the outcrop of the veins at the eurface to the deepest workings. So in the milling, say of the Bodie ore, the proportion of silver graine of the native alloy would he 37 grains, any in 100 above that obtained in milling would he from the minsralized eilver mixed with the vein matter.

The native alloy of the Comstock belt in every 100 grains contains about 43 grains of silver. Many who have not made careful examination of the rocks in the proximity of those auriferons quartz veins, which are enclosed or occupy the planee of "cleavage" in slaty rocks, the mother lode for instance, which appears to he on the line, and cansed by the outhnrst of eruptive rocks, might think that those veins had no connection with plutonic rocks, and that the gresnstone (really diorite), gsnerally mst with on the hanging walls of that lode was a sedimentary rock. Such mistakes are of frequent occurrence.

Specimen marked "A," also section cut from it, is from the hanging-wall of the Eureka mine, Grass Valley. The serpentineous character of a portion of this specimen is excesdingly intsresting. I am of the opinion that the serpentine to ths north of the Eureka and Idaho lodes, was originally an intrnsive igneous rock. Specimen "B," and section is from the Sierra Buttes mine; spscimsn "C" and section, from the Oneida mine, Amador, and specimen "D" and section from the Pine Tree, Mariposa. These are all associated with ths gold of the first ags.

The metalliferous or ore channel of Bodie, extsnds the whole length and brsadth of the ridge, *i. e.* from what is known as Bodie Bluff to Queen Bee hill, having a length of 10,800 ft. and a hreadth of 3,600. (See general view of Bodie, Mr. Anderson's map of that place).

The Prevailing Rock

Is a trachytic diorite, in almost every etage of alternation; the eame character of rock that forms the hanging wall or eastern houndary of the Comstock lode, and which appeare at the Comstock to occur in two forms—sheets and dykes. On the top of the Bodie bluff the rock ie what was called in the olden terminology, "Trachyte Amphibole Andesite." From the top of Bodie bluff to the lowest workings of the Standard mine, altogether a depth of 1,264 ft., the rocks, though apparently of very different varieties, are all really merely local differentiations of the eame rock, which can be seen and examined from the blnff to the Osceola shallow level; from that down to the Syndicate tunnel in the Tioga mine, in its workinge hslow the Syndicate tunnel and in the Standard mine down to the 1,000 level, making a section of 1,264 ft.

If you will examine the longitudinal section which I have placed under the general view of Bodie, the numhere marked on it indicate the different parte from which the specimens, which I now euhmit for your examination, were taken. These rocks belong to the latter part of the tertiary and the heginning of the post-tertiary periods.

Silver hill is in places capped by volcanic conglomerate; near the entrance of the Aurora tunnel and also south of the Queen Bee hill are eome basaltic rocks, sections cut from which very much resemhle those from American Flat on the Comstock. What is called the "white-cap" is a pyritoue greyish-white trachytic, very similar to that which is mentioned hy Mr. Dainhree in hie paper on "The Occurrence of Gold in Australia." Specimen No. 1 and eection, Bodie hluff; specimen No. 2 and section, Tioga mine; specimen B. 2 and seotion, Belvedere mine; specimen No. 3 and section, Bulwer tunnel; specimen No. 4 and section, Syndicate tunnel; specimen No. 5 and section, end of east cross-cnt, 500 level Standard mine; epecimen No. 6 and section, 430 level Bodie mine; epecimen No. 7 and section, 800 level Tioga mine; specimen No. 8 and eection, 500 level Dudley mine; spscimen No. 9 and section, 100 level Standard mine; epecimen No. 10 and section, White Cap, Silver hill; epecimen No. 11 and section, wall rock, Noonday lode; specimen No. 12 and section, wall rock, Noonday lode; epecimen No. 13 and section, hasaltic rock east of Aurora tunnel; specimen No 14 and section, Comstock, Gold hill, at 1,700 ft.

There Is a Jointed Structure

Running north snd eouth through all the Bodie ore channel, in which the planee of jointure have a north and sonth direction and a slight dip either to the east or west, in conformity with the configuration of the hill. These planes of jointure are either filled with clayey matter or veins, the former, ae well as the latter, though in a less degree, being metalliferous, and in reality this is what may be eaid to form the Bodie ore channel. There are two marked and dietinct classes of veins met with in the Bodie ore channel: first, large veine called lodee or true veins; and the eecond, small veins, gash or crevice veins—the first occupying portions of fissnree or rents, which divide and dislocate the jointed structnre, cansing a vertical displacement, generally on that side of the country rock, which forms the hanging wall. The amonnt of dieplacement, or "throw," as it is called, can easily be eeen and measured in sedimentary rocks, which have alternating bede of limeetone, shales, sandetones, etc.; hut in eruptive rocks, like those of Bodie, it is very difficult to make any calculation reepecting it. The underlie of the Bodie trne veins varies from 40° to 60°, these veins heing from a few feet to 30 ft. in width. The non-metallic or gangue portion of the lode conaists principally of quartz and carb nate of lime. The metallic portione are electrum and native silver, mixed mineralized metals in the form of cerargyrite and polybasite, etc., heside which a small quantity of magnetic iron and iron pyrites and what the minere term "wad"—an earthy oxide of manganese—is found. A large portion of the gold or electrum is met with in a loose and free etate, so much eo that it might nearly he eluiced out just as it comes from the mine. The Noonday and Standard main lodes belong to this class, though the Noonday underlies to the east and the Standard to the west. At Silver Hill, which is very correctly named, lodes, also of this character, are met with, euch ae the Oro, etc., in which rich and most heautiful specimens of pyrargyrite are found; also some rare silvsr ore, curionsly mixed with gold or electrum, has heen tsken from a mine called the Concordia, which I much regrst not having had an opportunity of examining.

I think the

Prospects of Rich Silver Mines

At the south end of the Bodie ore channel are very good. The second-class small veins, gash or crsvice veins, are very numerous at ths north end of the Bodie ridge. Thsy mersly fill portions of the planes in the jointed structure, their underlie heing the same as the dip of the planes of jointurs, which they sometimes follow down till intsrsected hy other diagonal joints running along diagonals into other dip-joints.

This class of veins is very limited in extent, and gsnerally give out at no inconsiderable depth. Many of these veins tsrminate in the hanging walls of the larger veins or lodes. With respect to ths filling of these vsins, vast periods of time must havs elapsed for such processee to have taken place. Rocke met with at or near the surface of the ground, and also thoee at great depths, appear never to be in a etate of rest; they are always changing or nndergoing some alteration—in a measure proving the *uniformitarian* doctrine, which maintains that all changes were produced by the slow and continuoue action of causes now in operation.

In the depression of the ridge near the north end (see general view of Bodie), the rocks "in place" are covered to a depth varying from 50 to 100 ft. by debris, consequently very few of the veine in that part of the ground have any surface outcrop, and are what the California miners term "hlind leads." At some fnture time I hope to be able to give you a detailed deecription of the rock sections I now suhmit to you, and analyses of the different rocke.

It ie perhaps unnecessary for me to add that there is no porphyry or felspathic porphyry on the Bodie ridge. The term "porphyry" means without addition or qualification, "quartz porphyry," a plutonic and much older rock than any met with in Bodie.

I never remember having seen any lode which was worth working that had porphyry for its walle.

I was in hope of getting analyses made of some of our California rocks at the laboratory of the Mining Bnreau, hut that usefnl and really necesaary part of that institution was etarved almost at its birth by the withdrawal of the necessary fnnds to carry it on; so that in future any important rock must be sent to England for analyeis. The mining commnnity of this State know either too much or too little; they huild gorgeoue and costly marble palacee for interaction in stock speculations, hut appear to be sensitively economical in supporting any institution that would afford practical instruction to the working miner. California, I believe, is the only civilized part of the world that can hoast of

Not Having a Geological Map.

The need of such a map and of a collection of the minsrals and rocks of the State, does not appear to he rightly understood.

In 1851 I assisted in making a collection of the iron ores of Great Britain for the indnstrial exhibition of that year; the reeults of which and the value of a geological map are told in a few words hy Prof. W. W. Smyth, in hie introdnctory lecture on the opening of the London School of Mines, 1852: "Few among the crowds, who, at the late Industrial Exhibition, ewept past the eeriee of iron ores brought together from all parts of Britain by Mr. Blackwell, could have prophesied that the collection of a half dozen of those eomber stones would give rise within a few months to an active industry which hide fair to develop a new phase in the gigantic phenomenon of the British iron trade. An example this, of the mutual dependence and assistance of the three eister eciences, where geological reasoning had to point out the tract in which a given formation was to he found; mineralogical observation to discover the actual deposit, and chemical analysie to determine the value of the ore."

The Cleveland iron ore allnded to occnrs in heds of from 15 to 20 ft. thick in the Middle Leas. So after the discovery of the ore at Cleveland, those interested in iron making had only to conenlt the geological map to know where to look for it. One-quarter of the iron production of Great Britain ie from that eource. I trust I may not he misunderstood in this communication, which is really a very humble effort to attract attention to improvements in legitimate mining. Are there not numerous sources of mineral wealth lying unemployed because we do not understand how to take advantage of them? I feel sure that enlarged opportunities of learning brought within reach of tbe working miner muet prodnce their fruite in due eeason.

In conclnsion, the resnlt of many yeare of experience in its nse, confirms me in the helief that the *Microscope in Mining*, with which the miner is enabled to distinguieh the trne character of the conntry rocks, will eoon be found to he an instrument nearly equal in importance, and as necessary in mining, as the compass is in navigation.

It is reported that the Dunkin mine of Colorado will omit ite dividend this month, not hecauss there is no money in the treasury, hut hecause the ore is not so rich. The first dividend of this mine was paid Novemher 1, 1880, at the rate of 7½c. per ehare, and the last wae paid June 2d at the same rate. During thie interval, 15 dividends were dishured, aggregating $200,200.

MECHANICAL PROGRESS.

Purchasing Steel.

The stael maker deals with three classes of customers. Tho first simply orders steel without knowing what quality to hny or what qnality he is going to get. The second explains the purpose to which tho steel will he devoted and lenves the quality to the judgment of the maker, or the dealer, as the case may be. The third orders the particular quality he desires, after specifying that the eteel must contain so much carbon, or possess certain properties which may seem most desirahle for the purposee for which it ie intended.

Customers of the first cless are generally the most ignorant. Wo menn ignorant so far as a practical knowledge of the qnality and usee of steel are concerned. The second clnss are conservative, and throw the hnrden of responsibility of selecting the steel upon the maker or dealer. While tho third nssumes a knowledge of the kinds and qualities of steel aud its adaptability to the purposes designed.

Ono of the chief trouhles in the steel trade is tho innhility of many consnmers to recognize the different qualities of eteel offered in the mnrket. Thns it frequnetly happens that n really first-class eteel is pushed aside and diecarded for a much inferior mske, simply because the consnmer is nnnhle to tell the differenco hetweeu the poorest nnd the best. Stesl is an article that cannot safely he purchased npon inspection.

Whilé it may he trne that the carhon in stsel, for ordinary practical purposes, may be detected hy the sight, there are other propertiee such as strength, hardness and working qualities that can only he determined hy mechanical tests, and herein lies the difficulty in selling steel. Some smooth-tongued salesman, representing an inferior hut good-looking steel, comes along and, instead of ehowing the cnstomer, hy the proper tests, what it can do, rather supplante these tests hy hie own plnnsihle commendations of its quality, and thns the consumer is whsedled into huying it, and finds sooner or lnter that he hne made a eerions mietake in trusting to the salesman's word, instead of demanding a physical test, and actually ascertaining the true quality of the material before purchasing. Of course there are many concerns where these tests are demanded in the first instance, and such houses rarely find themselves the victims of an imposition; for the eelling of a poor grade of eteel in the name of the hetter grades, is most certainly an imposition. It might he proper to say that we do not essert that it is the dnty of the maker always to stand the expense of these tests, as the determination of the quality is often of more interest to the consumer than the seller. Ae there is no general rnle without an exception, so the rule of requiring teets hefore purchasing a steel with which the consnmer is not familiar, may reasonahly he relaxed in favor of some of the oldest and hest estahlished hrands which have been teeted repsatedly hy the hest authorities, and whose qnalitiee are endorsed hy many of the moet experienced workers of eteel in the country. In such instances the purchaser relies not npon his own unaided judgment, not upon the interested etatement of the salesman, hut upon the testimony and experience of other consumers who are fairly supposed to he impartial judges.

The practice of seeking tenders of hids on specifications for steel, which prevaile among many large consumers, hoth in this country and ahroed, is looked upon with considerahle disfavor hy the producers of the highest grades of steel, hecause, as they allege, the tendency of snch methods is to indnce makere to allow a deterioration in the quality in order that they may meet the low price of competitive hiddere and yet retain their usual profits. The asking for sealed hids is a direct attempt to rednce the maker's pricee to the minimum. The hest steels are thus forced into competition with the poorer steels. If the purchaser is a judge of grade and quality, he may he willing to pay a higher price for one steel than another, hut if he is not, then the maker, to insure a aale, muat, in nine cases out of ten, mark down his own price or lose a sale. Sometimes the consumer is indifferent ahout the quality. He may he a maker of sham machinery or cheap tools, or he may use the steel where he is indifferent as to its strength or lasting qualities. In snch cases he does well to get the cheapest hids that he can; hut if he is making meritorious goods, certainly hia seeking for a competition among the eteel producers will not tend to help the quality of the eteel which they will make to fill hie order. If they do give their hest quality, it is that they think more of the reputetion of their steel than for the meaeure of their profit, or that the competition hrought forth hy the hidding did not run so far ae to ruin their chancee for a eatiefactory profit.

The difference in coet hetween the best eteels and the pooreet, ie not sufficiently large to warrant a manufactnrer, who deeiree to uee the heet, to change from a well known and thoroughly reliahle hrand to one of unknown quality and unfamiliinr make. And hence there ie no one thing that the user of steel ehould be more careful ahout than in changing off a quality of eteel that he knowe to he good, for one, the merita of which, as far aa he ia concerned, are yet to he determined. If a change ia made it ehonld only be aftor a moet thorongh trial of the new steel and a satisfactory determination of its qnality. And it mny be wall to state that it is never advisnbla to experiment with mora than ona mnka of steel nt a time, hecanse there is great liahility to confnsion as the different makee of steel nre likely to beoome mixed, when no definite determination ae to their respective merits can be made. Manufaoturers cnn readily see how this confnsion is linble to occur. It is now not infreqnently tha caso that larga manufacturers confine their teste to one eingle make until they have fully proved its qualities before trying another. The makere of steel ehould nlso learn one lesson from this, and that is, that after having estahlished n reputation for the qnality of their metal, they shonld strive to keep their future productions fully up to the standnrd, so that those employing them may have no occasion for making experimsnts with rival stsele.—*Industrial World.*

An Engineer on Faulty Boilers.

A practical engineer writes: "Most employers do not take into consideration that one engineer can consume from 25% to 50% more fuel than another; also, that expensee on repairs and other mnttere will he in the same proportion. The man hae run an engine, and that ie all that is required of him in the employer's opinion. As long as employers are of this opinion, who can wonder nt hoiler explosions? I eimply wonder thnt there are not more, when wa look ahout us and ese how hoilere are managed; hlown out when the masonry is overheated; safety valves overloaded and corroded to their eeats; gauge cocks etopped up; pressnre gmges out of order; hoilers corroded; flues chokad, and other had disorders. When we come to sec all this, we wonder there are not more crystallized, distorted, lagged and twisted hoilere, nnd not more explociens. I once knew an old flue hoiler that was so thin that the back end fell down, forcing the support through the shell. Thie hoiler had heen in constant use for many years; but business hecame dull, and it was allowed to etand for a short tima nearly full of wnter; and when the engineer ceme into the hoiler-room the day previons to starting, he found the hoiler in this condition, evidently too weak to sustain its own weight. I wae once called upon to run an engine in a large lenther manufactory. I fonnd that the gauge cocks hed not heen in use for a long time, and conld not etart them from their seats. On making inquiry I found that the engineer had for two yeare depended solely upon an automntic water gauge. Now we all know that any automatic arrangement for indicating the water level in a steam hoiler is not a reliahle device, nor is it possihle to construct one that is reliahle. When hoiler ownere become convinced that patent damper regulators, automatic hoiler feedere, low water alarms, fusihle plugs, etc., do not, with an ignorant engineer, make a hoiler safe and prevent explosions, the hetter it will he for the community, although I do not condemn their use, hut rather encourage their adoption, if properly cared for hy a competent man; hut it would he far hetter to pay their equivalent to n good man, rather than use them with a common lahorer ne engineer. I, for one, would not trust myself to lahor in a huilding where they use an antomatic hoiler feed, for pumping the water, and a common laborer to shovel the coal."

ZINC SHEETING FOR IRON SHIPS.—In a yacht recently lannched at Rutherglen, Scotland, the zinc is 28 ounces to the square foot, hetween wind and water, and at the bottom 28 ounces per square foot. Zinc is the only metal capahle of application without injury to iron, as it protects it from corrosion, and the combination of the two metnls causes the zinc to act as copper does on the hottom of a wooden ship. The sheathing zinc is attached directly to the iron plating of the vessel, no paint of any kind heing nsed. The places on the iron where these attachments are to he made are first hurnished with an emery wheel, and the alloy used ie a solder. The zinc plate is similarly prepared and placed in position, and amalgamation is produced hy the application of heat. The laps and hutta are then soldered together, and are either lapped or hutt-jointed together. The first vessel with this aheating has heen in work for nine months. It trades in canals and rivera ahounding in acida from chemical worka; all corrosion of the iron hottom of the vessel heing, according to the *Ironmonger*, effectually prevented hy the zinc sheathing.

PETROLEUM AS FUEL.—Russian engineera and technologists appear to he decidedly in advance of ue in respect to the utilization of petroleum in place of coal for generating motive power of every deecription. In the neighhorhood of the oil regione of Russia, crude petroleum ie very generally nsed for eteamhoat and locomotive propulcion, ae well ae for other uece in generating power where coal has hitherto heen employed. In heating power, petroleum ia eo decidedly anperior to coal, that no quection can be raised againet ita use on the acore of economy; and in all the experimente that have heen made with it in thie country, it hae demonetrated ite merits in the moet aatiafactory manner. Ruecian engineere who have occaeionally vicited thia country, have repeatedly expreeeed their aurpriee that, in a conntry like oura, where euch ahundant snppliee of petrolenm are availahle, its advantagea aa a fuel have not heen more fully developed. In thia respect, Ruasia, which is eo far hehind us in many other respecte, can teach us a valuable leeson.

SCIENTIFIC PROGRESS.

The Color of the Sun.

Prof. S. B. Langley, Director of the Alleghany Observatory, famous in the line of discovery in solar physics, ie about etarting on an expedition of scientific and popular interest. The mnin object of this expedition is to determine hy actual experiment the nmount of heat given hy the snn to the earth, and also the true color of the sun, as it would appear to an observer beyond our atmoephere. Numerous queetions of importance to meteorology are closely involved in thie inquiry, and hence it hae a direct practical hsaring. A liberal citizen of Pitshurg, Pa., who wishes thnt his name should not he made pnhlic, has defrayed tho large cost of the requisite npparatus, nnd aleo of the incidentnl expenses of the expedition. The co-operation and hearty nseistance of Gen. Hezsn, Chief of the Signal Service Bureau, hae been given to the enterprise, and it proceeds under his official direction. To attain its special object the expedition must seek one of the most elevated summite on the continent, in an extremely arid region, these two conditions heing essential. These are only to he found comhined in the remote localities of Arizona and Southern Californnia, in places far from civilization, and where the aid of government hy the War Department is indispensahle both to provide transportation and protection.

One of the ohjects of the expsdition will he to prove hy a new clase of experiments a curious conclusion which Prof. Langley has already arrived at: to the effect that the snn is not really a white, or yellow, or even a red ohject, hut that sunlight ie in reality "desply, darkly, heautifully hlue." We, however, see snnlight only through the delusive medinm of an atmosphere. Wa are in the position of people who nave heen looking through colored epectacles without knowing it. If we had alwaye looked at the electric light in this way—eay through yellow glasses—we ehonld have fully helieved it yellow. The proof that we have a hlue sun is, however, somewhat conclusive at present, and this expedition ie likely to add to the strength of the proof. Thie ie not merely a suhject of curions inquiry. If our atmosphere in reality has played the part of yallow glassce, it follows that an enormous proportion of the sun'e heat has never heen taken into account in those questions of ecientific meteorology which have a epecial hearing on climate, and hence npon agriculture and other practical affairs. Two adjacent stations will he selected, respectively at highte of 3,000 and 14,000 ft. for purposee of comparison, through their very different thicknesses of atmosphere. The *personnel* of the expedition will include at least eix specialists, of whom one will he an officer from the army, three from civil life, and two noncommissioned officere of the Signal Service. The expedition starts July 1st from Pittsburg.

UNITED MEETING OF BRITISH AND AMERICAN SCIENTISTS.—The rumor has heen started that at the forthcoming meeting of the American Association for the advancement of Science, to open at Cincinnati August 17th, a proposal will he suhmitted to extend an invitation to the British Association to hold their annnal meeting for 1883 in this country, in conjunction with the American Association, at some place to he hereafter decided upon. This enggestion, it is added, has heen received with much favor hy many of the leading memhers of the American hody in the United States and the Dominion, and the hope is expressed that the British society will find no insnperahle ohjection in the way in departing from ite usual custom of holding its annual meeting at home. Should the suggeetion hear fruit, the united meeting of British and American scientiste will douhtless he one of great interest to the friende of science in the two countries.

OBJECTS ON THE RETINA AFTER DEATH.—Much was expected from the discovery made hy Prof. Boll that the imagea of the ohjscts remain on the retina of animals after death. It was thought, for example, that the last scene of myaterious murder would he found hy properly examining the eyea of the victim. Actual tests have shown that the optogrnm can he of no use in detecting crime. Dr. Ayera made more than a thousand experiments in the lahoratory of Prof. Kuhne, at Heidelherg, and met with hut poor success. The hest result was ohtained hy expoeing the eye of a living rahhit, which had heen dosed with atropine, to a photographic negative, and even in thie case the optogram was imperfect, indietinct, and evaneecent.

FORMATION OF MOUNTAINS.—Speaking of the formation of mountains, Prof. Favre, of Geneva, hae eaid that the three systema which account for the origin of mountaine do not differ greatly from each other. Those who admit the syatem of elevations as the principal cauee would prohahly admit the formation of depreeione aa a eecondary cause, while thoee who give depression the firet place would aleo admit elevation ae a secondary factor. Laetly, in the syetem of lateral cruching there ie a general depreeion of the earth, aince there ia a diminntion in the length of the radiua of the globe, and yet there reeult elevationa of the gronnd in the midet of thie general depreeion.

Storing up Electricity.

The principle adopted hy M. Faure for storing electrical energy ie founded npon an inventien made some 20 yeare ago hy M. Plante, which he called a secondary pile, and which of itself was nlso a means of storing electric energy to a certain extent. M. Faure'e plan is described as follows: "It consists of two platee of lead immersed in water, acidulnted hy snlphuric acid. This pile is inert in itself, inasmuch as the two electrodes are identical; hnt if it he connected with an electric generator—as a voltnic hattery or dynamo-electric machine—oxidation tekes place on one of the lend plates, resulting in the formetion of a thin coating of peroxide of lend, while the other plate remains as metallic lend. The pile is then detached from the charging hattery, and the electricity remains stored up in it so long ns the polarization of the plate coutinues. When the two elcctrodes are joined hy n conductor, there is ohtained an electric current, intense hut of ehort duration; the pile ie discharged nnd the plates assume their normal condition. With a Plnnte conple, having one-half square meter of surface, the current is sufficient to heat to redness for about ten minutes, a platinum wire one millimeter in diameter, nnd from 7 to 8 centimetere long.

M. Faure's invention consists of an improvement on Plante'e pile, hy which its capacity for etoring electricity is greatly increased. This consiste in furnishing the lead plates with a quantity of the oxide at the start. Eech plate is covered with a layer of red oxide of lead, held in place hy pieces of felt fastened to the plates hy lead rivets. These are then rolled together in the ehaps of a spiral, and immersed in dilute acid. When connected with a hattery or machine the oxide on the positive electrode is converted into the peroxide, while that of the negative is retnrned to the metallic state. In this way the electricity can he carried from place to place, the capacity of the hattery depending, apparently, upon the amount of oxide with which the platss are enpplied.

Whether this method of conveying electric currents will prove more economicel than hy metallic conductore remaine to he seen, hut at present it looks rather douhtful. The May numher of the *Journal des Usines a Gaz* is largely devoted to a discnssion of this discovery, and from it we learn that M. Reynier claims that the Faure hattery will give out 80% of the power used in charging it. This etatement ie supported hy M. Dumas, who places the loss at 20%. M. Hospitallier, in *L'Electricien*, criticises thsse etatements, and claims that, taking into consideratien the losses eustained in the transformation from mechanical to electrical energy, hy the dynamo-electric mnchine, as well as that in converting the electrical power of the hattery into mechanical force, the most that can he ohtained from Faure'e hattery is 52 5% of the energy necesary to charge it. The ordinary method of transmission by metallic conductore easily yielde 60%.

As might have heen expected, the discovery of M. Faure has passed into the hands of speculators, who are making fortunes for themselves at the expense of those unfortunate persons who possess more money than foresight.

SPEED AT WHICH WINGS ARE DRIVEN.—The speed hy which some wings are driven is enormous. It is occasionally so great as to cause the pinions to emit a drumming sound. To this source the huzz of the fly, the drone of tha hee, and the hoom of the heetle are to he referred. When a grouse, partridge or pheasant suddenly springe into the air, the eound produced hy the whirring of its winge greatly resemhlee that produced hy the contact of steel with the rapidly-revolving stone of the knife-grinder. It has heen estimated thnt the common fly moves ite wings 330 timee per second, that is, 19,800 times per minute, and thet the hutterfly moves its wings nine times psr second, or 540 times per minnte. These movements represent an incredihly high speed even at the roots of the wings; hut the speed is enormously increased at the tips of the wings, from the fact that the tips rotate upon the roots as centers.—*Fraser's Magazine.*

SPEAKING TUBES NOT A MODERN INVENTION.—There can be hut little douht that speaking tuhes were used by the ancient Romans. The Rev. John Bruce says they ran along the whole length of the great wall which surrounded the city. An early Engliah poet alludes to them as follows, as quoted hy Mr. Bruce:

"Townes stood upon my length, where garrisons were laid
Their limits to defend; and for my greater aid
With turrets I was built, where sentinels plac'd
To watch upon the Pict; to me my makers grac'd
With hollow pipes of hrasse, along me still they went,
By which they in one fort still to another sent
By speaking in the same to tell them what to doe,
And sos from sea to sea could I be whispered through."

A CURIOUS EXPERIMENT in heat is performed with an apparatus devieed hy Dr. Graesl. The apparatue coneiets of three concentric veseele, separated hy annular spaces of ahout three-fourths of an inch. The outer epace ie filled with oil and the inner with water. The oil ia heated to a point ahove 212° Fahr., when the water hegins to hoil. Oil heated to 300° ie then introduced into the central veeeel, and falls rapidly to a temperature ahout that of the hoiling water. Dr. Grasal finds that thia central oil cools the more quickly the greater the heat of the outer ring of oil—a reeult seemingly very paradoxical.

The Mining Share Market.

There is very little interest shown in the stock market, prices being pretty well off at present. The assessment on California is the sensation of the week. The Sutro Tunnel folks have cut through a vein 15 ft. thick from wall to wall, of which six ft. is solid quartz, with occasional spots of metal. This is 300 ft. east of the Yellow Jacket shaft and 67 ft. from the Kentucky line. As the vein is in andesite, and has a slight dip west, it is supposed to he a large feeder of the main ledge.

Although the hydraulic pump runs very well, it is not yet doing all that is desired, and new valves and air-chambers have been ordered and will he here in a week. Meautime the pump will he run in case of accident to the Norcross or other pumps.

The following companies had an indebtedness July 1st. Alpha, $17,329.39; Best & Belcher, $5,694.39; Bullion (including $142,866.66 due the Ward Co.), $149,162.62; Belle Isle, $10,567.88; Betty O'Neal, $16,710.90; California, $108,042 04; Con. Virginia, $57,803.51; Equator, $7,573.95; Gould & Curry, $6,250; Metallic, $8,690.92; Mexican, $31,850.15; Utah, $6,969.27; Union, $40,000; Wedge, $520.70.

The following companies had a halance on hand Jnly 1st: Alta, $21,589.75; Alhion, $16,204.66; Argenta, $11.20; Benton, $22,772.91; Bulwer, $69,954.02; Bodie, $17,509.10; Crown Point, $38,903.85; Challenge, $444.02; Chollar, $15,531.68; Con. Imperial, $12,573.92; Exchequer, $1,304.81; Grand Prize, $3,239.85; Hale & Norcross, $10,225.85; Independence, $1,806.78; Lady Washington, $2,765.45; Mt. Diahlo, $833.67 (the company still owes H. H. Allen $8,000—$7,586.16 in hullion not included); Northern Belle, $191,599.19; North Bonanza, $5,059.54; North Belle Isle, $1,792 38; Ophir, $40,262,39; Occidental, $8,370.67; Potosi, $8,672.88; Standard, $242,353.74; Sierra Nevada, $18,003.15; Silver Hill, $3,989.66.

Following are some of the June pay rolls, which will show what is heing done on the Comstock: Yellow Jacket, $10,594.25; Alta, $6,138.88; Benton, $3,054.16; Overman, $4,196.50; Caledonia, $1,280; Forman shaft, $8,188.54; Con. Imperial, $4,786; Alpha Con., $150; Exchequer, $150; Gould & Curry and Best & Belcher shaft, $8,105.50; Union shaft, $19,520.37; California, Con. Virginia and C. & C. shaft, $24,352.50; Ophir, Mexican and Union Con., $19,710; Crown Point and Belcher joint air shaft $4,515.50.

The bullion receipts at Salt Lake for the week ending the 1st, were $150,000.

Mining Rulings.

The acting Commissioner of the General Land Office, in reply to a Nevada inquirer, says:

First—A location of a mining claim may he made hy an agent.

Second—The certificate of a recorder of a mining district that work to the value of $100 has been performed upon a lode claim is merely prima facie evidence of such work. When a conflict arises hetween an original locator and one who relocates upon an alleged failure to make the required annual expenditures, the question of the true value of such expenditures is one of fact, to he determined in a snitable action hefore the proper legal trihunal.

Third—This office has no authority to regulate the fees of mining district recorders, or to decide when snch fees are reasonable and when excessive.

Fourth—Section 2, of the act of January 22, 1880, provides "that the period within which the work required to he done annually on all unpatented mineral claims shall commence on the first day of January succeeding the date of location of snch claim." Hence, a claim located on the first day of January, 1881, is not subject to relocation, for failure to perform the required annual labor, until the 1st of January succeeding the date of the original location, viz.: on the first day of January, 1882.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

Massachusetts Con. M. Co.—June 5th. Location: California. Capital, $2,500,000, or 250,000 shares. Directors—W. E. Dornett, T. W. Hutchinson, S. A. Worrall, P. Crowell, A. C. Hammond, P. McMahon and C. L. Meyer.

Business Correspondent.—Wm. R. Bentley, a well informed Californian, has gone East on a tour among the larger cities on the other side of the mountains, as husinese correspondent of this paper. Mr. Bentley is well posted in matters pertaining to this cost, and those who meet him, desirous of information about this part of the country, will he able to learn many details. We hespeak for Mr. Bentley, among the patrons of the Press, a cordial welcome.

Esmeralda mining district has yielded about $15,000,000, and yet not even respectable gopher holee show for it.

Gen. Connor, authority in mining matters, says Bntte City, Montana, is the hest mining district on the continent.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

Kennedy.—Amador *Ledger*, July 2: As a set-off to the discouraging fact of the complete stoppage of work at the Oneida mine and mill, it affords us pleasure to be able to announce that the Kennedy, adjoining the Oneida on the south, is developing into a splendid property The drift running north has encountered a body of quartz 12 ft in thickness, and said to be rich in quality. Indeed the future of the mine looks more promising to-day than at any time for many years past. Claus Spreckles, F. Riechling, and other prominent stockholders, were up here last week, accompanied by Mr. Skidmore, a mining expert. They came for the purpose of looking into the value of the recent discoveries for themselves, with the view of being better able to determine the best course to pursue in regard to future working. Two hundred tons of the rock is to be crushed as soon as possible, and if the yield comes up to expectations, it is generally understood that a new mill will ere long be erected.

BUTTE.

Electric Light at Cherokee.—Butte *Record*, July 2: The Spring Valley M. Co., of Cherokee, now have the electric light in successful operation in their mines. An effort was made to introduce the light early last spring, but owing to some defect in the machinery used to generate the electricity, the first attempt to introduce this modern illuminator did not prove a successful one. The light is said to have given entire satisfaction to both workmen and owners.

CALAVERAS.

Gleeson.—Calaveras *Chronicle*, July 2: Operations are being prosecuted in the Gleeson gravel mine, Cbils gulch. The incline is 350 ft in length, reaching bedrock, and the tunnel is continued on a level about 50 ft. A gravel crusher—a new invention—has been put up and it is said does its work well.

Glencoe Chips.—Forty men are at work on the ditch, which will convey the water to the Valentine. There are also several men at work on the ground where the mill will be situated. Within 90 days we expect to hear the thundering of 20 stamps in Valentine gulch. There are many leedes in this section. Our merchants wear smiling faces and seem to be greatly pleased at the turn business has taken in this locality.

Corral Flat.—The Corral Flat gravel mine, south of this place, on Corral flat, is in the very best order and running finely. The shaft is down to the ledge, about 125 ft, and timbering is now going on preparatory to drifting. There is an immense body of as fine looking gravel in the mine as ever was seen, and several pans of dirt which we saw washed prospected handsomely.

Norwich Mine.—On the 25th ult. the shaft had attained a total depth of 180 ft. This work has required months of unceasing labor, also an expenditure of many thousands of dollars, but it has been quickly prosecuted day and night. The absorption by this company of numerous mining claims in the vicinity of its original ground and elsewhere in the district would manifest an unusual confidence on the part of its directors in the future of the Norwich and the district wherein it is located The most recent purchase by this company is the extensive and valuable mine and mill property formerly owned by C. J. Garland, Esq. This property comprises an 18-stamp mill, favorably located in Mosquito gulch, easy of access from all mines in the district, and is run by a 50-horse power engine; the noted San Bruno mine, from which over $70,000 has already been extracted; the Good Hope mine, a westerly extension of the San Bruno, which has yielded over $30,000; the Monte Christo, lying south and parallel with the Good Hope and San Bruno mines, has yielded $7,500; also the Montana mine, located south of the Norwich and on the same lead, has yielded over $8 000. These mines are all in slate formation. They have been tested and found to be permanent and rich in free gold and sulphurets.

Railroad Flat.—Cor. Calaveras *Citizen*, July 2: The mining interest in this vicinity has experienced a genuine boom, and the end is not yet. The mineral resources of this section of country has not been fully appreciated. Those owning mines were too poor to develop them, and as a general rule, California placer miners weaken very quick when they strike water in a quartz claim, so that this has practically been a *terra incognita* to mining men and capitalists in general. The days of selling prospect holes is past, and the men bad nothing but prospect holes to show. But mining men have ascertained the fact that this section is rich in mineral wealth, and the consequence is that mining and prospecting is being carried on with a vim and energy herctofore unknown. The Chapman is running full handed. The Buena Vista is working a few men. The Vances is running as usual. The Valentine is to have a mill, the contract having been given to the Globe iron works, of San Francisco, the mill to be built in 90 days, to consist of 4 batteries with room for 8 more, and machinery of sufficient power to run them, so that they can have a 00-stamp mill if desired, though it will only consist of 20 stamps to start with. The old gravel claim known as the Fred Rence claim, near Railroad flat, will start next month. This claim has paid well in former days, and there is every reason to believe it to be good property.

EL DORADO.

Georgia Slide.—Georgetown *Gazette*, July 2: While there we visited the Cashier mine, worked by Morgan Bros. & Beattie Bros., James Morgan, Supt, and found their mine in good running order, and their new hoisting works all completed. Their shaft being down some 40 ft. gives them a good start. The Pacific, Beattie and Blue Rock mines are all being worked with good results.

The result of the crushing of the 50 tons of Eureka rock by the Cal. W. & M. Co.'s mill at Greenwood, has proven very satisfactory. The sulphurets are being sacked to be sent to the Auburn works, when the true value of the rock will be determined. A carload of the rock is now being sacked direct from the ledge, to be shipped to certain reduction works in the East. Already enough has been determined to justify preparations for extensive working of the mine.

A Rich Pocket.—*Mountain Democrat*, July 2: An exceedingly rich pocket has recently been struck in the old Spong claim, near Clarksville, this county. Last Tuesday over $2,000 worth of gold was taken out, and the daily yield for several days has approximated those figures. The formation is decomposed quartz.

Bullion.—Miners who have been up from the Springfield mine, Mud Springs township, and others who have been down from Grizzly flat during the past week, have given most encouraging reports of the present gold production of those several localities. The Mount Pleasant and Melton mines at Grizzly, and the Springfield mine, near El Dorado are getting out and crushing large amounts of fine ore, and realizing handsomely in bullion. Mr. Ball, engineer at the Grand Victory mine, also makes a favorable report. They are keeping their 40 stamps constantly running, and will have 10 more at work within a few days, and the singular ore they are working on still continues to make satisfactory returns in the precious metal.

MARIPOSA.

The Monesto G. and S. M. Co.—Mariposa *Gazette*, July 2: The works of this company, which are located about 6 miles southeast of the town of Mariposa, are daily increasing in interest, and attracting general attention. Almost daily we are brought in contact with evidences of certainty that this mine is developing rock averaging a maximum value considerably above any that we have heard of in this section. A week or two since we, by accident, were favored with an exhibit of a report of

assays of rock, made in San Francisco, which showed an average, taken from 9 separate assays, $50 and a few cents over to the ton. Quite a number from town and from abroad have visited the mine and brought away specimens of the ore, which are to be found on the counters and shelves of nearly every place of business in town. Hence the exceeding interest felt by this community.

NEVADA.

WASHINGTON MINE.—Grass Valley *Union*, July 2: The recent cutting of a fine ledge in the foot-wall on the 205 level of the Washington mine has given great encouragement to the members of the company, who believe they are about to be rewarded for their patient prospecting of several years. The ledge is found to be between 3 and 4 ft. in thickness of solid quartz, which shows well in sulphurets, but delay has occurred in opening upon it on account of a scant supply of water for running the pumping and hoisting. This difficulty will now be obviated, as a stronger head of water has been secured.

SPENCERVILLE COPPER.—Grass Valley *Union*, July 2: The Speuceville copper mine is now shipping considerable copper from the mine Ore is also being shipped from other mines in that vicinity, and as satisfactory arrangements cannot be made with the C. P. railroad for carrying the ore to San Francisco, it is understood that wagons will be employed to haul it to a point on Feather River and taken by boats to the bay.

THE EAGLE MINE.—Nevada *Transcript*, June 30: During the past month the miners employed in the Eagle mine, situated near Pine Grove cemetery, have had very tough and dangerous work to do. When near the bottom of the old incline, which it is proposed to sink 100 ft deeper, they found it badly caved As fast as the dirt was taken out a fresh cave would occur, bringing down tons of earth, which continued until the place was very dangerous to work in. Several times the workmen were about giving it up, but were persuaded to try again. Finally by erecting posts 16 ft long and 8 inches square, and putting heavy spiling on top, they succeeded in getting it timbered down to the bottom, and yesterday a force of miners commenced the work of sinking the next 100 level. Three shifts of 8 hours each will be employed, and as the ground is easily worked it is expected to make 8 ft every 24 hours. When this depth is reached a tunnel will be run to strike the ledge, which is believed to be close by, and the work of stoping out commenced. Judging from the value of the ore taken from the incline by the previous owners, the prospect is good for the development of a dividend paying mine.

NEVADA CITY MINE.—At the Nevada City mine the incline is being sunk for a 450 level, now being about 50 ft below the 350. Stoping is going on in the north drift of the latter level where the ledge is from 3 to 3½ ft thick, and rich in sulphurets and free gold. The 10-stamp mill is running to its full capacity night and day, and the clean-ups are satisfactory. The company contemplate discarding the use of steam this fall and running the mill, hoisting and pumping machinery with water which can be purchased at a reasonable rate from the South Yuba Canal Co. This change would effect a great saving.

PLACER.

PROMISING DEVELOPMENTS.—Placer *Herald*, July 2: The developments this last week in the Conrad mine on Duncan Hill, have been very satisfactory. In the tunnel, which is now in some 475 ft, they have struck rich ore, and in the new shaft, some several hundred ft easterly from the main works, they have struck rock at a depth of about 75 ft that is rich enough for specimens. These developments indicate that the pay chute is extensive, and that the ore is of a high grade. With their tunnel now about completed their facilities for working the mine to advantage are very good, and it is only reasonable to anticipate some paying clean-ups from this ledge now in a comparatively short time. The owners, Roberts & Roberts, have been very persevering, and any development promising success to their efforts is a pleasure to chronicle.

A MINE SOLD.—The report that Martin Schroeder had sold his quartz mine, located on North Ravine, a little over a mile westerly from Auburn, has been confirmed. The purchasers are J. W. McCullough, of Ohio, and Isaac Heald, of Iowa, and price paid was $20,000. Mr. McCullough, as Supt., will commence actively to develop the property at once.

IT IS REPORTED.—It is reported that the owners of the Valley Forge quartz mine on Bald Hill were recently offered $10,000 in cash for their claim. The ledge is a large one and the general understanding is that the ore is of a high grade. That the old Shipley ledge is developing into one of the finest quartz mining properties in this section of the country. The parties who have been working it recently, it is said, have thus far cleared $5 a day apiece, besides paying for the mine and paying all expenses. That T. J. Hunter, who recently renewed work on his ledge on Duncan Hill, is taking out some very rich ore. That the Mountain Gate drift mine, at Damascus, in which we believe there are 21 shares, declared a dividend about the first of this month of $400 a share. That the quartz mines in Humbug canyon, below Damascus are no humbug, but are turning out very rich.

PLUMAS.

PURCHASE.—Greenville *Bulletin*, June 29: We congratulate Messrs. Corbin, Manson & Co. on their good judgment manifested in their recent purchase of the gravel claim of Loring & Leavitt, near Quincy. It is proving to be immensely rich, and when a much larger force is put on the results will be proportionately greater. Last week with only five men there was taken out in gold the handsome sum of $3,055. Howard Corbin, son of one of the owners, has gone over there and will remain in charge.

NICE NUGGET.—Plumas *National*, July 2: On Friday of last week the miners in the Loring & Leavitt claim came across a chispa weighing a little over $200. It looked black and rusty, and could easily have been mistaken for an iron rock, but was altogether too heavy. The next few weeks will probably bring to light several more of the big slugs.

SIERRA.

WAHOO.—*Mountain Messenger*, July 2: The mining interests at Wahoo, near Port Wine, in this county, are looking up considerably. Several claims are being developed, and the prospects prove that there is a rich channel under the ridge. One claim working there is getting gravel that pays an ounce per day to the pick, with a fair supply of water to wash it. Phil. Dorsey, about two miles up the ridge, is running a tunnel with flattering prospects. The California claim, still above, are to run a tunnel to tap their ground lower down, enabling them to work to better advantage.

RICH FIND.—About a week ago A. Denmire found a rich quartz specimen containing 12 ozs. of gold in Woodchuck ravine. "There is more there," he enthusiastically affirms, "when you get to them."

QUARTZ.—Charley Quirollo, of Loganville, has discovered the croppings of a very rich quartz ledge somewhere on the hill north of that place. The specimen shown is very rich in free gold.

ITEMS.—The company owning the Sierra Buttes and Plumas Eureka claims have given orders that all supplies for the mines must hereafter be shipped by Nevada City instead of Marysville. The Extension Co. found a $12 piece a few days ago. The gold becomes coarser as they get further into the channel. The Chinamen have commenced to dam the North Fork at this place. A China company are putting in a dam on the South Fork at Lon Ward's.

ENCOURAGING NEWS.—Hugh McMahon, of Eureka, called on us this week. He said that his father, E. H. McMahon, will have a good crop of hay and potatoes this year. In the quartz ledge, one mile north of their ranch, midway from the canyon to the summit of the mountain, gold is clearly visible in the croppings. Prospecting will be done this summer toward its development. Parties from Scales have talked some about locating extensions of the lode. If this promising discovery proves to be very extensive, it will attract the attention of capitalists and probably inaugurate a prosperous era in mining for this part of northern Sierra.

SISKIYOU.

ITEMS.—Yreka *Journal*, July 2: The Kanaka mine is forging ahead, with Bill Pollman as head man The head dam will be completed next week, at which time they will begin work and run day and night. The Centennial, under the superintendency of C. Mott, will start to-day, and the prospects are that a rich clean-up will be secured. Several of the hands have been in town on a trial as witnesses, so that the work has been delayed. The Fort Jones claim, under Mr. Marsac, started last Monday and are working away like bees, and expect confidently to clean up a fortune before long. The Phil Mott claim, superintended by Phillip Mott, began last week and are working steadily ahead with admirable prospects. Indeed the whole Klamath country is rich in gold deposit. The Portuguese mine, under the management of Morgan Pipes, is working and panning out in a satisfactory manner. During Mr. Pipes' presence in town in attendance upon a law suit, the superintendency devolves upon Mr. Joe. Mr. Wm. McConnell's claim is being prepared for work and will start before long. The Lime Gulch claim, under Dick Smith, is down about 10 ft., and is running day and night, employing a force of 22 men. The derricks work admirably, and there is promise of a large yield when they clean up.

NEVADA.

WASHOE DISTRICT.

NEW YORK.—*Enterprise*, June 29: The mine is kept in good repair. Pumps running as usual.

SAVAGE.—Waiting on the successful operation of the combination hydraulic pump.

GOULD & CURRY.—Joinst Best & Belcher shaft sunk and timbered 20 ft; total depth, 2,015 ft.

JUSTICE.—Work has not been resumed in this mine, but the expectations are that it will be shortly.

SILVER HILL.—The repairing of the machinery will be completed this week ready for starting by the 1st proximo.

BEST & BELCHER.—East crosscut, 2300 level, extended 14 ft. Joint Gould & Curry shaft sunk 20 ft; total depth, 2,015 ft.

KENTUCK.—The guides in the shaft will be in place by Wednesday. The working of the lower levels will shortly be commenced.

CALEDONIA.—The pumps have been run an average of 10 hours per day, consuming 4½ cords of wood per day. The Forman shaft has been sunk and timbered 25 ft; total depth, 2,005 ft.

CON. IMPERIAL.—We are pushing operations on the 2,000 level and have resumed work on the 2,800 The connection on the 2090 level with the Jacket is entirely closed, but every endeavor will be made to re-open it as soon as possible.

ANDES.—The drift from the winze is now connected with the main tunnel, giving a splendid supply of air. We are now opening a station, preparatory to further sinking. The west drift was advanced 13 ft during the week, and still continues in very hard blasting rock.

AURUM DISTRICT.

A BRIGHTER PROSPECT.—Ward *Reflex*, July 2: We learn that when the mill shut down at Aurum Monday last the ore going through pulped over $100 to the ton. The cause of the stoppage was an ore car getting loose, and smashing up things in the incline, thereby cutting off the ore supply. We understand there is a large body of ore in sight, and that there will be no difficulty in keeping the mill running after damages are repaired.

CANDELARIA DISTRICT.

NORTHERN BELLE.—*True Fissure*, July 2: The shaft levels are looking and yielding about the same as a week since, the only important change being on the intermediate, between the first and second levels, which is running a crosscut at a distance of 70 ft from starting point opened out some good ore that looks promising, the developments being in new ground. The 11th and 12th levels are looking well and turning out considerable ore. The levels above the adit show well throughout, the 5th especially holding its own remarkably. The stopes on the 9th level present a fine appearance and are producing a good grade of ore. The total production of the mine averages 87 tone daily. Bullion shipments for the week ending June 29th amounted to $23,933.04; total shipments on June account to 20th ult., aggregate $91,437.07.

MOUNT DIABLO.—The winze from the third level and the various workings on this level show no change. Thirty ft below the second level, in a drift running from a winze, some very good ore has been struck, the extent of which is as yet unknown. The stopes on the second level all look well and show some improvement. The stope on the first level continues to open well and shows about the same as last week. Bullion amounting to $7,592.81 was shipped on the 24th inst., and $7,748.24 on the 28th.

CHERRY CREEK DISTRICT.

THE TICUP TROUBLE.—White Pine *News*, July 2: Wednesday last the Ticup mill was closed down under an attachment of B. F. Miller for $1,600. The mine closed down the following day. There has been an old indebtedness on the property, contracted before the mill was started up, which has embarrassed the manager here in meeting his regular pay-days with the employees, and notwithstanding, fair bullion shipments have been made since the mill started up, the out-put was not sufficient to pay off the back debt and meet current expenses. The fault no doubt lies with the directors in New York, who expect too much of their manager here, and have hampered him at the beginning of his operations. There is no question as to the merits of the mine and its ability to pay off all indebtedness, if given a fair show. We have it on undoubted authority that large ore bresstw are exposed on every level from the second to the eighth. Altogether, the mine looks well, and in view of this fact it is unfortunate that this new enterprise has been brought to a stand still. Indications, however, we are glad to state, point to an amicable adjustment of the present trouble.

THE YIELD FOR JUNE.—The Star mine has since the 1st of January last shown a steady and regular increase in its bullion product. In January the bullion shipment of the mine was only about $7,000, while in June it had reached nearly, if not quite, $44,000. Mr. Fleishbacker, a director and large owner of the Co.'s stock, was up from San Francisco several days this week. He was well pleased with the prospects here and stated that $20,000 of the pro rata indebtedness of the company would be paid off this month.

ESMERALDA DISTRICT.

DEL MONTE.—*Herald*, July 2: Rumors to the effect that the Del Monte Co. would shortly put in suitable machinery and properly prospect their mine have been rife on our streets for some days, but the *Herald* has been unable to confirm the rumor.

THE CORTEZ having developed ore sufficient to run a 10-stamp mill for several years, and the grade being very high; also, having secured a desirable mill site and a good supply of water, the question, "Why don't they start the building of the mill?" is agitating the public mind considerably. We are assured that in good time it will be built.

THE HUMBOLDT WEST.—Fair progress has been made in the drift on the ledge south, and the vein is now exposed 15 or 16 ft, showing a splendid character of ore.

THE CENTENNIAL is drifting on the 150 level. The face of the drift shows good ore. As soon as the ore now at the mill is crushed the incline will be driven down.

THE ROTHCHILD.—Ore of good quality is coming up the shaft, and before long a crueking will be made.

CORTEZ.—The incline has now reached a depth of 146 ft below the tunnel level, making the total depth from the croppings 253 ft. There are several hundred tons of $100 ore on the dump, while the developments in the mine have exposed many thousands of tons of equally high grade and some of much better ore.

EUREKA DISTRICT.

STRUCK A BONANZA.—*Sentinel*, June 2: We have it from pretty good authority that a genuine bonanza has been struck in the Geddes & Bertrand mine, On the 300 level a drift from the tunnel has encountered a body of ore of immense dimensions. It has been penetrated a distance of 60 ft, and there is no footwall in sight. Mr. Clark, the superintendent of the mine, has gone to Salt Lake, with view of inducing the proprietors of the property to erect a mill at once. The main shaft of the mine, in the meantime, is being sunk 100 ft deeper. In Secret canyon the news of the great strike is the general theme of conversation, and a great boom is expected for that region.

LEWIS DISTRICT.

NEW MILL.—*Silver State*, July 1: James Hendrn, of Star, passed west yesterday on his way home from Lewis, where he has been at work for some time. He says Lewis is one of the liveliest little camps on the coast. Buildings are going up in every direction, and the mines are looking well, reports to the contrary notwithstanding. A good deal of rich ore is being extracted, and the new 40-stamp mill is being pushed ahead. A contract is being let by the Morning Star Co. for a 40-stamp mill, which is to be built as speedily as possible. When these mills are completed there will be over 100 stamps at work in the district. Nearly all of the mines are owned by Eastern capitalists.

PIOCHE DISTRICT.

SILVER PARK.—*Pioche Record*, June 28: There has been some very high grade ore taken from the mines at Silver Park lately. We understand that Felix Knight will ship ore to either Eureka or Cherry Creek to have worked, he being able to ship it that great distance and make considerably more on his ore, than to ship it only a few miles to the works around this locality. This certainly goes to prove that the chloriders in Pioche have a very poor opportunity of making anything. Our reduction works are well up in the division business. After they get the chlorider's ore in their clutches they call the poor devil up and divide. The chlorider is frequently coupelled to get a microscope to see his share of the spoils, and then it cannot very often be seen. George Terry, upon being informed the rates charged for the reduction of ore while here, wanted to know where the chloriders' percentage came in. A man being able to ship ore in wagons 200 miles for reduction, and receives greater profits than he can by shipping it to reduction works only 30 miles distant, speaks for itself. No wonder so many of our chloriders have quit work.

RAYMOND & ELY.—On Sunday last a few men were placed to work repairing the shaft of this mine, it having commenced bulging at several places, owing to it not being in use. Everything connected with these works is kept in the best of order.

SEVERAL of the men working in the Mendha mine have become leaded. All of them appeared to be taken with the sickness at the same time.

RAYMOND & ELY.—*Record*, July 2: Judging from the turn things have taken, it is not probable that anything will be done with the Raymond & Ely property for the present. The parties wishing to buy the property have doubts as to Lazard Freres being able to give a good title, notwithstanding they guarantee perfect title. The Eastern stockholders and persons in San Francisco are determined to fight Lazard Freres for the possession of the property in the courts.

THE MILL of the Bristol Co., owing to being short of salt, was compelled to stop running for a few days. During the period the mill was idle the well was enlarged and some repairing done. The ore in the Mayflower mine is gradually improving, and the ore body growing more extensive as work progresses.

QUEEN SPRINGS DISTRICT.

THE MILL.—White Pine *News*, July 2: We learn that Supt. Dickinson, of the El Capitan mine at Queen Springs, is putting the company's mill in order preparatory for a run. He has a nice quantity of rich ore on the dump. It is the intention to start up the coming week.

SILVER CANYON DISTRICT.

BETTER.—White Pine *News*, July 2: Dr. Brooks was in town several days this week on business. He says the mines out that way look better than ever. The mill will resume operations again in about a week.

SOUTH MOUNTAIN DISTRICT.

COMMENCED.—*Silver State*, July 2: A letter received by A. J. Shepard from a friend at South mountain, says the Varcuff M. Co. have commenced operations as it they meant business. They own nearly all the mines in the camp, some 12 or 15 in all, and have commenced work on 5 of them. A Mr. Gove, of Salt Lake City, has charge of the smelting works, and is getting them in shape for work. The mines look well, and are producing some high grade ore. The new company seems to have plenty of money to properly develop the mines and pay for labor and material promptly. G. S. Mackenzie, the general manager, who arrived a few days ago, is elated over the prospects, and good judges of mines and ores see no reason why the company should not succeed.

SPRUCE MOUNTAIN DISTRICT.

AT WORK.—White Pine *News*, July 2: We learn that the Spruce Mountain Co. has commenced work on their property at that place, after a suspension of several years. They are repairing the furnace, have put men on the mine, and evidently mean business. Parties acquainted with the property tell us that the outlook at Spruce Mountain is very promising.

SWEETWATER DISTRICT.

THE MINES.—Esmeralda *Herald*, July 6: The mines in this district are attracting considerable attention. There is scarcely a day that the S. T. Co. do not carry down from 1 to 3 and 4 experts, capitalists, assayers or prospectors. The reports are all favorable. A. Soderling, of Bodie, who has just returned from that locality, is very favorably impressed with the mines, so far as surface indications go. The mineral belt is fully 2 miles in length, and many of the ledges are very wide, with strong formation. Dr. Summers has exposed a vast amount of rich ore in his mine and it is improving every day. It is not necessary for prospectors to go to Wood River, Arizona, New Mexico or any other distant places to prospect; there are just as good fields much nearer home.

WARD DISTRICT.

A CHANGE.—Ward *Reflex*, July 2: One shift has been knocked off in the upraise from the Martin White tunnel, and until connection is made two 8 hour shifts will be worked. It has been found necessary to pursue this course in order to allow the smoke and bad air to escape. The air has been so bad of late that it has been impossible for three shifts to put in anything like full time. For some time past it has been almost an every day occurrence for one or more of the men to be overcome or affected by bad air and smoke. The change will give 4 hours between shifts for the smoke to get out.

ARIZONA.

YUMA.—*Press*, July 2: Some new gold discoveries have been made about 3 miles south of Yuma, and several locations made by residents. The quartz shown us is very favorable looking. Work on two of the claims will be commenced at once. Verily Yuma is looming up as a mining center. Messrs Hance & Ashton own a fine gold claim 3 miles south of Yuma, and intend developing without delay. Healy & Mendez also have a location in the adjoining hill. These mines, in the neighborhood of town, are all on the main gold belt.

POORMAN'S DISTRICT.—The shaft on the Amelia is now down 40 ft. It follows the footwall and is entirely in ledge matter, with no sign of the hangiug wall. As far as opened the vein carries about 18 inches of high grade argentiferous galena ore. An open cut has been made across the croppings of the Boston claim, giving a good face for a shaft, which will soon be started. The ore taken from the diamond is similar to that of the Boston, and the quartz of the Boston, Diamond, Brilliant, Boss and Florence Eaton mines is of the same character and about the same grade. Negotiations are now pending with Eastern parties for the working of these mines on a large scale, and Poorman's district is undoubtedly destined for a bright future.

SILVER DISTRICT.—The Silent mine has shut down, pending the letting of new contracts. Franklin J. Clark, has put a force of men at work on the Black Rock, and the preliminary clearing away of the mesa dirt has unearthed a placer of rich silver nuggets similar to that out of which the original locators of the Red Cloud (now the Silent) took out over $9,000 in 2 months. Mr. Clark is having those nuggets sacked and stored so as to prevent their being stolen. Crosscutting still continues on the Klam. Nothing definite as yet. The remarkable body of ore recently discovered in the Clip mine still holds out, and has every indication of being an immense bonanza. S. S. Draper has let a contract for work on the Mendivil lode, lately transferred for a consideration of $50,000. There is an adverse claim to this mine, and the workmen were served notice to quit.

NORTHERN COUNTIES.—*Arizona Miner*, July 1: While the mines of the northern counties of the Territory have not had the send-off accorded those of the southern counties, the day is fast coming when their fame will resound far and wide. Yevapai, Mohave, Apache and Maricopa counties have some good bullion-producing mines, such as the Vulture, Tiptop and McCracklin. There are hundreds of other good mines that will be successfully worked soon after railroads, now being built, shall have pierced these counties. Let no man now falter and fall by the way-side in Northern Arizona, where there are at least 100 rich mines, out of several hundred poor ones; where poor men are every day making money by crushing little piles of rock in erastras with horse and mule power. Tuscumbia mill, running. Dake's furnace, on Lyon creek, is turning out bullion. Gov. Power's mill, near Peeples valley, is running and paying. The Belle mine, in Big Bug district, is yielding fine ore. The bottom of the shaft is about 300 ft below the surface. The Silver Belt is, as usual, giving up rich smelting ore. More bullion will soon come from it. Mr. F. W. Blake and other local capitalists are interesting themselves in mining, knowing that to this business must we look for success in almost everything. Mr. B. T. Riggs, formerly of Virginia City, Nevada, is doing his best to arouse our property owners to the necessity of opening and working good mines. We have good news from Mohave county, where mining for the precious metals is the principal industry.

COLORADO.

SHAFT.—*Register-Call*, July 2: Hon. W. J. Lewis and associates have let a contract to sink a shaft on the Manitoba lode 75 ft. When the depth shall have been attained, cross-cuts will be run. John Elliot is driving the Rocky Point tunnel, below Missouri falls, and has stripped considerable mineral in tunneling which has been left standing. Negotiations are pending for the purchase of the Garibaldi lode, owned by a party of Austrians, and situated below the Rocky Point. The tunnel started above the falls on Missouri gulch, and in the same belt as the Rough & Ready, Morse and Hard Money veins, although driven less than 100 ft, is showing up well. Sears & Morris, the owners of the tunnel, have taken up a mill site near the tunnel. At present there is sufficient water in the gulch to drive a 25-foot water-wheel. Locke & Hamilton are opening up the McIntosh lode, back of the Locke dwelling house, at Belford City. The ore is very rich, selected lots having brought 90 cents per pound at the smelters. The Toronto, owned by Dripps & Co., is turning out large quantities of ore, which comes from near the surface. Development of the Alaska vein is being made through a drift east at a depth of 160 ft But very little ore is being raised.

IDAHO.

WOOD RIVER.—*News*, June 29: Last week Ames, Altafer and La Parte bonded their Ophir mine, up Quigley's gulch, for $6,000. The boys received a considerable of the cash in hand. Doc Bisbop, J. Qualtrough and the Cowin boys own the Green Veil, an extension to the Occidental, in Greenhorn gulch, and Al. Cowin has gone up with a force to work on the Veil. The Occidental, on Greenhorn creek, was discovered last summer, and was always considered good. In fact a little work was done on it last winter, and it was then bonded for $10,000. Our informant stated last Monday that they had the mine in excellent shape for work now, and the pay ore was fully 4 ft thick; also, that Warren Hussey had offered the fortunate possessors $20,000 for their property.

BLANKET LEDGE.—Upon the very summit of Lookout mountain, east of Bellevue, is a veritable blanket ledge of rich galena ore, known on record as the Queen Victoria. It is the property of Messrs. Miller & Lusk, and for 2 or 3 weeks they have been stripping the ledges in an easterly and westerly direction, drifting a strip about 5 ft in width across the surface. The stripped portion is a curiosity, and well repays a visit to the summit of Lookout. Over the entire exposed portion lies the galena in sheets and bunches which will average about 6 or 8 inches thick. There is a dip on one edge which indicates that the vein will straighten up when prospected thoroughly. There is no estimating the extent of this "rich blanket," but the ore will be raised and sacked as soon as the sacks can be obtained.

MONTANA.

FURNACES.—Butte *Miner*, June 29: The Argenta furnace will be started up soon, with a good supply of high grade galena ore to run on that will yield good paying returns. Both stacks of the Glendale furnace are now running daily, and the per diem production is 12 tons of base bullion, valued at about $300 per ton. Ten tons of silver ore from the Blue Wing lode, Blue Wing district, Beaverhead county, was lately shipped to Salt Lake city, where the ore sold for about $251 per ton. The Alta-Montana Co.'s works at Wickes, now in course of rebuilding, will be more extensive than those destroyed by the late fire, and $200,000 will probably be expended by next fall on the works. Many of the lodes located in the McCarty district, in Madison county, are looking first-rate as far as developed, and from some of the openings ore is taken that assays high up in the ounces. A Sheridan correspondent says that the Montana M. & M. Co. is actively engaged, on Wisconsin creek, in preparing for the erection of a new 10-stamp mill, now at Dillon. The Broadway gold bonanza at Silver Star, in Madison county, is showing a larger body of paying ore in sight than ever before, and it is believed that $100,000 worth of free milling gold quartz is in sight in this celebrated gold mine. The driving of the long tunnel to tap the Excelsior gold lode in the Bannack district, owned by Phil Shenon, is progressing favorably. It is expected that the tunnel will strike the vein when it is driven a distance of 450 ft, and that the work will be accomplished by fall. When the mine is opened by this tunnel it will be in such shape that the extraction of a large amount of high grade ore can be cheaply and expeditiously accomplished.

OREGON.

NOTES, ETC.—Bedrock *Democrat*, June 21: The Camp Carson mines, owned by L. W. Nelson, of Salmon creek, near this city, are located in the mountains toward the head of Grand Ronde river, and are in charge of Kum Lum, a Chinaman of fine business attainments and well experienced in mining. He is employing 15 men, but will soon largely increase the working force. This mine has the finest water privilege of any mine in eastern Oregon, and the ditches cover a vast acreage of the very finest mining ground—indeed, the whole face of the country, for miles around, prospects well. J. B. Gardner, of this city, is doing well at his mammoth Trail creek diggings, situated about 9 miles from Camp Carson. Chinamen are in full force at the crossing of the North John Day, and say they, "bleep catch 'em plenty glood." Independence seems a little dull, however, we are informed by reliable parties, that the miners would take out "lote of gold."

FIVE bars of copper bullion, the product of the present run of the furnaces at Railroad district, have been shipped east, and teams are hauling more metal to Elko.

Plants Worth Trying in California.

The following ie Part III of the report of H. Behr and W. G. Klee, to the State Horticultnral Society, of plants mentioned in Baron Von Mueller'e "Select Plants," and which are deemed worthy of trial in this State. This hranch of the report was preeented at the June meeting:

Bamhoos: Under this head may he included all tree-like gressee, hnt especially those of a very hard and tongh nature. Of the vaet number of hamhoos fonnd in America, Africa and Asia, we find eome 80 different species mentioned as likely to succeed in euh-tropical countries. We shall mention but a few, not hecause we think them little likely to succeed or of emall importance; on the contrary we euhecribe fully to the eloquent plea of Ferd. V. Mueller, wherein he cells attention to their great usefnlness for a multitude of purposes, and we believe thet their importance can hardly he overestimeted for treeless countries, where along the irrigating ditchee they should he planted in every available spot. Our reason for naming but few is that the hotanicel names are generally not known in the countries where they are moetly cnltivated, except in hotanical gardens and their immediate surroundings. This is shown by the fact that even the government importations of last year are wanting in correct names. To give, therefore, a number of hotanicel namee, would he of little henefit to most people here who heve no meane of procuring hamhoo except hy getting them from the nativee and under the local neme of the country, he it Mexico, South America, Chine, Jepan or India.

Arnndinaria felcate: Is the Ringal or Nigala hemboo; a netive of the Himalaya mountains; fonnd at an elevation of from 3,500 to 10,000 ft.; it risee to the hight of 40 ft., with cenes, however, of hnt fonr inchee in diameter. The canes are etrong and dnrehle, and may he nitilized for a variety of purposes. In the Garden of Economic Plents in Berkeley there ie a plent of this species, raised from seed, hut 18 months old that has in three weeks made canes nearly eix ft. long, and thet without much moisture. This bamhoo ie hesides perfectly hardy, even where it is heaten down with enow every winter. It is, furthermore, easy to increase hy division and cnttings.

Dendrocalamne strictns: Recommended es reieeting great heat and cold; a!so for growing on *dryer* ground than hamhoos generally; attaining a hight of 100 ft. Its etrength and eolidity meke it very valuahle. It is fouud in India, speoially in Bengal. Seeds, donated by Baron Ferd. V. Mueller to the University Gardens, ceem to require great heat to germinate.

Bambuse vulgaris: Is the large unarmed hemhoo of Bengal; grows to the hight of 70 ft. It is, however, less hardy than any of the first named, thongh it will resist occesional frost, and might no douht find many localities in the Stete to euit its reqnirements.

Phyllostechys nigra: From China and Jepan; is a very hardy, hlack-stemmed species, growing to the hight of 25 ft. It is utilized for chairs and walking-sticks, as the canee are nearly solid.

In connection with these few named species, we muet mention that in the Gardens of Economic Plants in Berkeley are now growing five distinct epecies, derived from variouo sources, none of which we have heen ahle to determine the hotanical name of. Three of these were imported hy the Agricultnrel Department, and nemed *Bambusa metake, B. moso, B. tadake*, None of these are real hotanical namee according to the hest authority consulted on the snhject (Gen. Munro'e Monograph of the Bamboos), exoept perhaps *B. metake*, which, however, does not answer to the specimen on hand. All these are doing well. A fourth kind is the eo-called *moso*, a slender species of rapid growth in Japan, utilized as greens, like asparagus. A fifth is a direct importation from Choo-foo, China, planted right from a tuh into the garden. It esnt forth shoots that in less than three weeks have grown six ft. This epecies may possihly he *bambusa vulgaris*.

Before leaving the bamboos, we desire to repeat that we have the greatest appreciation of the importence of the bamhoo for California, and would he very grateful for any information and local experience in regard to these plants.

Boemeria nivea: The ramie. Although no meohine, ae yet, hes solved the difficulty in regard to the preparation of this fiher plant, it is gratifying to know that it ie perfectly hardy and well edapted to a greater part of Celifornie, as experiments in varions parte of California have proved. As a paper plant it might, perhaps, find favor, until the inventive genius of the Yankee has solved the difficnlt prohlem of constructing a ramie fiher machine.

Bœmeria tenacissima: Is, according to French and German seedsmen, the moct valuahle fiher plant, much snperior to *nivea;* this, however, ie contradicted hy the report of the Washington Agricultural Department, which eays that the two are identical for all practical pnrposes.

Buxns sempervirens: The tree hox. Ae the hoxwood is in constant demand and its supply in Asia Minor hecoming scanty, it is to he hoped that eome one will nndertake the planting of it, which, perhaps, will he an investment, slow in its returne, hut likely to he a sure and profitahle one in the end.

Chrysanthemum (Pyrethrum) Rosenm and Carneum: The ineect powder plants. Ae the oultivation of the *Pyrethrum cinerariefolium*, or Delmation feverfew, has heen started on a large scele, it deserves notice, that besides the nemed epecies, there are five othere that are utilized for this purpose, viz.: *tenuifolium, Wilde no vii, persicum, corymbosum, macrophyllum;* and though some have settled on the Dalmetian, others may he equal, or, psrheps, hetter cuited to some localities than others. The difficulty that hes heen experienced in getting seeds of the various kinds is now passed, es Prof. Riley has eent seeds of *roseum*, to several places in the State, and the Stockton firm have decided to sell their seed of *cinerariefolium*.

Diascorea, Yam: *Diascorea hastifolia* ie native of Weetern Australia; ie recommended es very hardy. *D. japonica*, the Japanese, and *D. glabra* (Batatas), deserve trial. The letter has letely heen distrihuted hy the San Francisco *Bulletin*. *Diascorea alata*, the Uvi yem, is a epecies that hails from the South Sea islande, hnt has heen grown successfully in New Zealand, and would most likely flonrish in parts of California, where too early night frosts do not occur.

Stillingia sehi fera (enphorhieceæ): The tallow tree of China; has heen naturalized in eome of the Southern Stetes, and is probahly perfectly herdy in the greater part of this State. A vegetahle tallow ie derived from the coating of the seede; hence the name.

Fatsie (Aralia) papyrifera: Is planted for ornament, and seeme perfectly hardy from San Francisco sonthward; as a source of the heautiful rice paper it might perhaps find more extensive use; it is the pith that is utilized.

Fourcroya longæva: Ie a near relation of the Century plent (*Agave Americana*), from the high mountains of Mexico, at an elevation of 10,000 ft. It reachee gigsntic size, with a stem 50 ft. high, and a penicle of flowers about 40 ft. The fiber obtained from this, as well as from the perhaps less hardy *F. gigantea*, ie very strong.

Guizotia oleifera: From India and perhaps Abyssinia, is the source of the Remtil oil, utilized like the Bene oil (*sesamum*), for culinery purposes as well as in various industries. It is a yellow-flowered, coarse looking composite herh, that seeme perfectly adapted to the hay climete, meturing in Berkeley good seed, where the season is too cold for the Bene. The seede of this plant are also known ae Niger eeeds in the London market.

Indigo: The various epecies of Indigo, *Indigo pera, Anil* and *Tinctoria*, are douhtless well adapted to the southern part of the State as far as heet is concerned, hut with irrigation and consequent additional lahor it is perhape a great question whether it conld be produced at a figure low enongh for competition.

Jubæe spectahilis: The Coquito of Chile, is one of the hardiest palms. In its netive home it is ntilized for the production of a syrup for which the tree is regularly tapped. It is said to he very prodnctive. The young plent resemhles closely the date-pelm.

Kentia sapida: The Nika palm of New Zealand Chatham islends, ie a heautifnl palm yet hardly known in this country. The nnexpended flower stalks are nsed as pelm cebhage.

Liquidamher Formoscena: From Chine, givee a species of sweet gum utilized for feeding a kind of silkworm.

Liquidamher orientalis: From Aeia Minor, yields the vanille-scented liquid storax, prized in perfumery.

Maouttia Puya: Is a etingless nettle like the Remie, utilized for ite fine fiher. It is an Indien plant found as high as 4,000 ft. elevation.

Maranta ernndinacea: Is the true arrowroot of commerce. The cnltnre of this plant ie comparatively eesy. It has, as far as we are aware, been cultivated with snccess in Fresno county.

Nicotiana persice: The shiraz tohecco, is recommended as adapted for more moist and cool climate.

Plectocomia Himalayensi: Is one of the hardieet rattan pelms.

Pogostemon patchouli: A labiate (mint-like) herh that produces the patchouli so much used as a perfume. It deserves notice that the seede of *Hibiscus Abelmoschus* (*Abelmoschus* hy the Germans) hes been introdnced to this country, the Department of Agricultnre having twice received seed of this from two different eources. The true petchouli is a native of the mountaine of India.

Quercus Aegilops from S. Europe: Is a nearly evergreen oak, the frnit of which is *available* for dying and tanning; the cupe are called velenie, while the nnripe acorns are celled camate; ripe, they may he eeten. The tree is furthermore a line avenne tree.

Pueraria tuherosa: From S. Asia, is a tall, woody climher helonging to the pea family (*Leguminoseæ*), the tuhere of which are long, and rich in starch; it is perhaps the same species as *P. Sieboldii*, that in Japan furnishes a euperior starch. This plant hae heen tried with snccesss in the Garden of Economic Plants, in Berkeley, where it grows without irrigation, sending out vines 12 to 15 ft. long in a few months.

Quillaya Saponaria (Rosaceæ): The Spanish hark or soap-hark of Chile, is the product of this tree. It reachee an enormous size. Seeds are very light and apt to be ahortive; due care should be taken to have them perfectly ripe for shipment, or they will not keep.

Rhamnns cblorophorus (*Rhamnaceæ*) Buckthorn family: From the hark of this Chinese tree is a very euperior green color derived, utilized particularly for silk. *R. utilis* is another speoies used for the same purpose. The dye from theee trees ie oalled Lokao.

Rhue vernicifera terehinthaceae: Is a medinm eize tree of Japen, yielding the true Japen varnish. This ae well ae its close relation *Rhus succedanea*, are hoth well adapted to the climate around the bay, as treee grown in Berkeley show.

Rhus Coriaria: The tanner'e eumech, is a oonth European species, the foliege of which is extremely rich in tannin, and in great demand. This epeciee can douhtless he grown with euccess on dry ground, ae the plant not alone prefers it, hut ite product here ie superior. The attention should be called to propertiee of the native California sumech that are very rich in tannin—*Rhus integrifolia* especielly, an evergreen epecies abundant on the eouthern coast. The poieon oek (*R. diversiloba*), might no douht also produce a fine varnish, if the way of handling it with impnnity was studied ont.

Salix purpurea: From Europe and Asia; ie one of the hetter Osier willows. Thie species, as well as the real Osier, *S. viminalis* and *S. triandra*, should be planted along water courses, instead of the native more or lese hrittle epecies. Cuttinge of these could, in proper season, be shipped with the greatest safety.

Stipa tenacissima: A gress found in South Europe end North Africa, known as the *Esparto*, or *Atocha*. Ite principal use, of late, hes heen for the manufaoture of paper, hut as it is content to live in dryest spots near the desert, it may prove valnahle as a forage plant. The plant deserves speciel trial.

Vahea florida: A native of Weet Africa, but fonnd np to 2,500 ft. elevetion. Is a heautiful climher, with white, fragrant flowers, the plant yielding ceoutchouc.

Santo Domingo Mines.

J. P. Lee, Superintendent of the Sento Domingo group of mines owned by Lyman A. Smith and others, returned from the scene of his labore last Saturday. He was here to make his regular monthly report and will leave again for the mines in a dey or two. He reports a greet deal of activiy in the Santo Domingo district on hoth sides of the line. The working eheft on the San Emeterio ie now down 35 ft., and in the last three ft. the ore vein increased 14 inches in width. The ore is still of the eame charecter, rich chloride and sulphurets. The Piteya is constantly improving as depth is attained. The main shaft on the Fresh Start is down 75 ft., with 35 ft. of drift from the hottom. An immense hody of free milling ore is heing uncovered.

Work is progreesing on the Guadalupe and the developments are line. Thie is a contact vein lying hetween granite and slate. A 10-ft. shaft on the Turner mine has exposed a vein of ore 22 in. wide that averages $500 to the ton. Six hundred ft. farther along the lode, another shaft is heiug pnt down. A force of men is sinking on the El Manto, on top of the divide, sontheast of the old workings. Work has just been commenced on the Mammoth Copper end Silver lode and it prospects exceedingly well. Mr. Lee hae made a new strike in the neighhorhood of the Sen Emeterio mine, encountering the same character of ore. He hae also, in connection with Simon Hermen, located a gold and silver mine not fer from the Guedalupe.—*Yuma Free Press.*

Magnetic Separation of Iron Sand.

One of the American contrihutione for the Electricel Exhihition at Paris is a modification of Mr. Edison'e magnetic separator for the treatment of iron sand found in large quantities on the south ehore of Long Island and in other locelities on sea coests. According to Mr. Batchelor's etetement to the N. Y. *Evening Post*, the Long Island sand conteins 26% of the finest iron known. Innumerahle attempts heve heen made to seperate the send, and magnetic plates have been used hefore, hut with no success on eccnnt of the presence of what is known as titanite iron, a suhstence which spoils iron. Edison discovered that titenite iron was less megnetic then the pure iron particles, and constructed his separatpr with that fact in view. The sand falls a distance of 4 ft. in a thin stream from a elit in a V-shaped box, holding ahout a ton. Under this box is a receiver divided into two compartments, the dividing pertition heing placed nearly under the elit in the send reservoir and parallel to it. If no magnet is hrought into play the sand ell falls into one side of the hox; hnt when a powerful magnet ie hrought near enough to act npon the falling ehower, the pure iron perticles ere deflected in their fall and fly on the other side of the pertition. The particles of titanite of iron are not attracted equally with the iron, and are not deflected sufficiently to fall into the compartment with the pure iron. A company has been formed for the extraction of iron from Long Island send, and ie now at work with its first machine at Quogue, near Moriches, on the Great South hay. This machine, which cost $700 to make, ie managed hy one hoy, who keeps 6 men and 2 carts busy hringing eand for his hopper. It treats 100 tons of sand a day, prodncing ahont 20 tons of pure iron, costing $1 a ton to produce and eelling for $6.

THE Hihernia Con. Mining Co., of Leadville has declared a dividend of 10c per share, or $30,000, payahle at New York July 2d. This makes $180,000 in eix months.

THE Denver *Tribune* says that the Good Luck Mining Co., paid its second dividend of $5,000 on the 7th of June, the firet of $2,000 having been paid April 1et.

Steam Wagons.

Steam wagons are elowly gaining entrance to industrial use on this coast. In Nevada, they are employed for heavy freighting, and in this State they are heing urged as well fitted for hauling grein to the river lendings. There are many favoreble conditions for the use of steam wagone on tbis coast. The long, dry eeeson, during which most of the hanling has to be done, eneures a hard road bed and none of the vexation of mud, as in countries where enmmer ehowers are frequent. Another great adventege is the almost dead level and exceedingly eesy gradee which characterize onr velley roadways. True there is high fuel and sometimes scarcity of water which must be counted on the other side of the eqnation. However, the steam wegons are going to have thorough trial, in hande of those who believe in them, and this will demonstrate their euccese or failure. The Colusa *Sun*, which has an open eye for all improvements likely to edvence the producing interests, says:

After all his experiments, Captain Roberts, of the San Joaquin Co., is still an enthusiast about his steam wagon enterprise. We had a conversation with him sometime ago, and he thinks that roads suitable for his wagon can be built very cheaply. While the wagons run, and pull very heavy loads on common roads, he thinks of digging two small graded ditches and filling with gravel, which will pack as hard as iron, and give a solid road for each of the broad wheels, and for the wagon wheels that follow with the loads. The Chico *Enterprise*, of Tuesday, has an item to the effect that this "steam wagon has been thoroughly overhauled and improved at the Union Iron Works, Sacramento, and on a recent trial worked satisfactorily. Its weight is 17 or 18 tons, and it is calculated to haul 50 tons of grain at each trip. It will be taken to the Upper Sacramento valley in a day or two, and will engage in grain hauling between Riceville and McIntosh's Landing." Capt. Roberts will, if this one shall prove the success he anticipates, put on wagons to run to all the principal landings on the river, and thus cross-section the entire Sacramento valley. He will have in effect a freight railroad across the valley, from foothill to river, every 8 or 10 miles. We sincerely hope that the wagons may prove successful, as it would be one of the grandest things for the Sacramento valley that could be imagined; that is, always provided we can keep the navigation of the river from being destroyed.

Yes; and the last proviso is most important. We can ill efford to he-mud our rivers or neglect our oceen facilities. Our prosperity depends upon keeping all avenues open and then pushing our varied products into all parts of the world.

MILL SITES.—Where a mill site abuts ageinst the end of a lode claim, the natural presumption ie raised that the vein or lode extends heyond such end line and into the mill site. In a recent decision of the Secretary of the Interior it wes held, however, that this presumption ie not conclusive, hut mey he rehutted. Evidence may be suhmitted to estahlish the non-mineral character of the mill site, hut evidence usually accepted ae satisfactory in the case of a non-adjacent mill site, is insufficient where the lode claim and mill site are in actual contect. The evidence you recite is insufficient in eny event, for it is only alleged thet "no known vein or veins of quertz, or other rock in place, beering gold, silver, cinnahar, lead, tin or oopper exist on seid mill eite." Itsbould he further shown that there ie not within the limits of such land eny plecer, cement, gravel or other valuahle mineral deposit; and that no portion of said premises is claimed for mining purposes; also proof that actual development shows that the vein or lode does not extend heyond the end line of the claim, and such other evidence as will demonetrate conclusively the non-mineral character of the mill site.

LOCATION.—A mine owner in Utah pnts the following conundrum to the Commissioner of the General Land Office: A located a mining claim Decemher 10, 1879, and performed no lahor thereon during the year 1880. On Decemher 31, 1880, B mede a re-location of the seme ground, and on January 1, 1881, C made a location. Under thie statement of the case he asks to be informed: "Which location givee possessory title?" The Acting Commissioner replied today: "Thet thie office has no jurisdiction over questione of this character. Should either locator apply for patent hesed npon his locetion, and proceed in due form of law, patent would issue unless an edverse claim should he filed hesed upon either of the adverse locetions, whereupon proceedings wonld he suspended until the right of possession should he determined by the courts."

CITIZENSHIP AND MINING LOCATIONS.—The Department decides that the United States citizenship of an individual applicant for a mine may he proved hy the affidavit of the applicant made hsfore any officer authorized to administer oaths within the land district where the claim sought to he patented is located. This, of itself, however, is held to he the lowest grade of evidence of snch fact, and does not inhihit applicant from employing other modes of proof. To prevent delay, annoyance and unnecessary expense, the hetter way is to estahlish citizsnship hy the affidavit of one or more diointerested witnesses, and in this case it is not material whether such affidavits are sworn to within or without the land district where the mineral entry is made.

A NEW 30-stamp mill for the Farwell Con. mine is now heing pnt up at Leadville. The oompany is incorporated in New York, and is already working a 20-etamp mill.

The Engineer.

Tapping Eagle Lake.—The tapping of Eagle lake, in Lassen county, is an enterprise that bids fair now to become accomplished, and will be one of vast interest to the county. This enterprise, which will require the running of some 9,000 ft. of tunnel, or open a cut and a flume 17 miles long, will irrigate and open up for settlement about 100,000 acres of as fine agricultural land as there is in this valley, but which now is almost worthless, being covered with a growth of sagebrush. The parties interested in this project are known to have plenty of money, and will doubtless prosecute the work to completion. They will not be obliged to look to irrigation alone for dividends, as the lake has on its borders a vast supply of excellent timber, which can be floated down their flume with ease. The company have now on the ground engineers who have made the necessary surveys, and are now sinking shafts along the line of the proposed tunnel to test the ground to be encountered, and which thus far is much more favorable than expected.

Underground Railways in New York.—The subject of underground railways in New York City seems now to be fairly approaching a solution. A company has been organized to connect by a tunnel railway the Hudson River tunnel and the railroads which enter the city from the north and east by way of the Fourth Avenue improvement. The route will be from the outlet of the Hudson River tunnel, under Wooster St. and University place, to Fourteenth St., thence by a curve under that street to Fourth avenue, under which it will run to Forty-second St. It is to be a double-track road at least 18 ft. below the surface. The object is to carry freight and ultimately passengers under the city to New Jersey, so that cars may run direct from Boston or Montreal to New Orleans, Charleston, and other Southern cities without the annoyance and delay of a New York transfer.

The Channel Tunnel.—It was announced the other day that experimental borings for the tunnel between Dover and Calais had turned out very successful, but experts say the scheme is a visionary one, and eminent engineers laugh at on what they consider a wild freak of imagination the part of Sir Edward William Watkin. They want to know how the dirt is to be removed and ventilation secured for the workmen. It would be absolutely impossible to work trains enough through such a tunnel to make it pay, unless enormous passenger and freight rates were charged. Sir Edward's estimate that the seven ft. driftway can be completed in five years is ridiculed as a gross absurdity. The whole affair is probably meant as an attempt to raise the wind for the S. E. railway, of which Sir Edward is President.

A Railway Tell-tale.—A very ingenious machine has been recently invented on the Erie railroad. It registers the speed of trains, when and where they stop, and how long. It is used especially for freight trains, and is fastened at either end of small cabooses or at the side of large cabooses, about four and a half ft. from the floor. It was adopted because freight trains frequently exceeded the prescribed rate of speed. They would run very fast for some distances, and then take things comfortably for a time.

Pumping Machinery.—Speaking of the machinery used in our western mines, a prominent mining engineer recently said that in some of the deep mines there are employed single engines capable of raising a column of water weighing 90,000 lbs. a distance of 1,600 ft. seven times a minute; also, that safety cages, used in mines, travel at the rate of 3,000 ft. a minute, and propelled by a single engine, are able to hoist 1,200 tons of ore a distance of 1,500 ft. in one day.

Engineering Inventions.—Messrs. William H. Bomgardner and Henry Kerns, of Omaha, Neb., have patented a system of car braking by which the brakes are set instantaneously by diminishing the speed of the engine, and by which they can be released by increasing the speed of the engine, the object being to set the brakes automatically whenever the moving or standing train receives a shock from either end, the system being so arranged as not to interfere with hand braking as commonly applied.

Blowing up Icebergs.—A New York paper suggests a new occupation for the numerous steam pleasure yachts in the Atlantic waters. It is proposed that they cruise in the region of the Newfoundland banks, and when icebergs are discovered, send off a boat's crew, which shall drill deep holes in the dangerous monsters, in which shall be placed heavy cartridges of dynamite, which shall blow them to pieces, thus making ocean voyages much safer.

Sebastopol Works Burned.—On the 27th inst., the works, machinery, and 100 cords of wood of the Sebastopol mine, Grass Valley, were destroyed, and also the shaft for quite a distance down. The hands were all at dinner except four men, who were down the shaft, but the latter escaped through the drain tunnel. The total loss is $12,000; insured for $2,500 each, in the Home Mutual and the California, both home companies.

Useful Information.

Oil in Exhaust Steam.—At the recent meeting of the American association of Mechanical Engineers, Mr. Hartwell read a paper upon "A condenser and apparatus for purifying exhaust steam for oil." The principle for operation is to take the exhaust into a chamber of many times greater area than that of the exhaust pipe. The exhaust enters from above and the tendency of any particles of oil in the steam is to continue their course until they strike on a bed of stone chips confined in place by a wire screen. The steam meantime turns at right angles and slowly passes onward through several screens of wire gauze. Its motion, however, is slow, as the chamber is from 12 to 50 times as large in section as the exhaust pipe. In this chamber a proper grease overflow is provided. The grease has a great tendency to adhere to any solid bodies in its course, and by means of the screens and body of stone chips the oil is taken from the steam, leaving the latter free to rise upward and enter the condenser, which is placed directly over the oil trap. This is arranged so as to heat the water nearly to the boiling point, but without back pressure upon the engine.

Interesting and Valuable, if True.—Alfred Dumesnil, a son-in-law of Julee Michelet, and the editor of the first of Edgar Quinet's works, claims to have made an interesting and useful discovery—how to preserve plants in a perfectly vigorous state without any earth. Since November, 1880, the date at which his researches proved successful, he has continually been taking plants from the ground in France and applying his process to them; has never found the least interruption in their vegetative functions; on the contrary, winter and spring plants have blossomed with a vigor which, as an experienced horticulturist, he has never seen in his garden. With the shelter of a glass, hellebores taken up at the end of November and the middle of December, have remained from 2½ to 3 months in blossom. Other plants, primroses, daises, violets, auriculas, etc., have not only been in bloom for three months, but have thrown out new buds. Bulbous roots, small shrubs, exotic plants, such as azaleas and cyclamens, take equally well to the process.

Moth Preventive.—A correspondent of the *Furniture Gazette* recommends the following remedy for exterminating moths in carpets and furniture: After some years of experience with the troublesome pests, says the writer, I found a sure preventive of moths in pitch paper, the same as roofers use. The moth will live and grow on cayenne pepper and tobacco, while I never could see that the use of these articles kept the moth miller out. The plan for the furniture dealer or housewife is to cut the paper in slips and place about the room, under and behind sofas, chairs, etc.; this should be done as early as the middle of April, and in warm climates earlier. If the dealer wishes to make parlor suits moth proof, he should place on the inside of backs of chairs and seats, small strips of pitch paper, and rest assured that the miller will not select these places to deposit eggs. It is the miller that is the foundation of all the mischief.

Compressed Gunpowder.—Some interesting experiments with Messrs. France & Baker's compressed gunpowder have been made at Messrs. Pease's mines, in Skinningrove, Cleveland. The powder, says the London *Mining Journal*, which was Curtis & Harvey's, had been compressed into a triangular form, so as to fit the drill-hole, and cut in short lengths, some weighing 2 to 3 ozs. each. The holes were drilled in the same way as if they were about to be charged with loose powder, the triangular blocks were placed in and exploded in the ordinary manner, but more than the usual quantity of stone was brought away. In all, 11 holes were charged, requiring altogether 162¼ ozs. of the compressed powder, whereas with the powder loose it would have required, in the judgment of the miners themselves, no less than 267 ozs. This shows in powder alone a saving of just 40%, to say nothing of the advantage in charging and the diminution of danger.

Cement for Joints.—When rubber plates and rings are used for making connections between steam and other pipes, leakage of joints may be prevented by using a cement made by dissolving shellac in ammonia. The pulverized gum-shellac is soaked in ten times its weight of strong ammonia, when a slimy mass is obtained, which in three or four weeks will become liquid without the use of hot water. This fastens well both to the rubber and to the metal or wood, and becomes by volatilization of the ammonia, hard and impermeable to either gases or fluids.

Horsehide Belt Lacing.—A correspondent of the *American Machinist* describes a very durable belt lacing, which was made as follows: A dry, untanned horsehide was soaked in water until soft enough to cut, and then cut into strings. These were made soft and pliable for sewing by "sawing" them over a square-cornered iron. The belt was then sewed with the hair side inward the first time across, and outward on the finish, so that the hair took all the wear. After the string had dried it was as solid as any hooks, with the advantage that it could not unhook. It wore remarkably well and did not cut the belt holes.

To Upholstery Buyers.—Here is a practical hint to upholstery buyers. M. Chevruel is making known a new series of observations on the vision of colors. Any eye which has looked at red for a long time becomes blind to green, and is disposed to see everything red; a little while after, it becomes blind to red and sees everything green. It is for this reason that a buyer after examining a series of pieces of red cloth, finds the last less pleasing than the first. A seller would prevent this by placing before his customer some green cloth on which the buyer's eyes might occasionally rest.

Blacking Piano-Forte Keys.—A good black ink is as effectual as any stain to blacken the sharps of a piano. It is, perhaps, not generally known that, though made of ebony, these keys always require staining, as true ebony is rather brown than black, and full of a yellowish grain. Old keys are probably saturated with grease; they should therefore be treated with potash first.—*English Mechanic.*

White of Eggs as a Lubricant.—A Dresden man has made a good lubricant for shafts by mixing the whites of eggs with the finest graphite powder, until of the consistency of firm dough. This is kept in boiling water till the whole is coagulated. The mass is then reduced to powder.

A New Tinner's Tool.—A valuable machine for tinners has been invented by a Bristol, Tenn., gentleman. It is thought that it will supersede the square, circular shears and dies now used, which cost about $800, and that it can be run with great rapidity by foot power, as well as by steam. The inventor thinks the machine can be furnished, complete, for about $200. The model is on exhibition at Bristol, and attracts much attention among machinists and mechanics.

Steam Packing.—A new steam packing has been patented, which consists of a series of prismatic plates, the meeting faces of which are parallel with each other and the periphery of the rod, such plates encircling the rod and the joints between the meeting edges, or between such edges and periphery of the rod, being covered by the second series of plates overlapping the first.

Shingle Roofs.—Shingles are made more durable and less liable to ignite from sparks when subjected to the following treatment: Water, one gallon; chloride of zinc, one-half lb.; digest in this the wood for 48 hours, drain, and put into a solution of crude tungstate of soda one lb., water, one gallon (hot), for three hours; then dry.

Good Health.

A Barber on Baldness.

Speaking of the credulity of many people touching the efficacy of hair tonics, an intelligent French hair dresser says:

"Very often the hair falls out after sickness. In such cases it generally grows again without the aid of any hair tonic whatever; but when it falls out from natural causes it never grows again. The celebrated Dr. Bazin, who was formerly physician-in-chief of the St. Louis Hospital at Paris, and who is known throughout the world as the most learned specialist for affections of the skin, told me one day that there was nothing that could make the hair grow after the baldness had come on gradually. This I believe firmly, or, if there was anything of the kind, we would not see so many New York doctors with heads as completely destitute of hair as the backs of turtles.

"I don't think I am far from the truth when I say that during the past 25 years that I have practiced the profession of hair dresser, I have made the trial upon different bald heads of more than 500 different hair tonics, and I am bound to admit that I never saw a single head, the hair of which was restored after baldness. At the end of so many failures, I am completely undeceived as to the value of all the preparations; and I would not now recommend any one of them, because I would be afraid to commit the crime that is designated by the words, 'obtaining money under false pretenses.' In my pathological studies upon the hair, I have found that people who perspire a great deal from the head are apt to get bald. The bad habit of wearing hats indoors is also very hurtful to the hair. In 1806, after the famous battle of Jena, in which the Prussians were completely defeated by Napoleon I, Baron Larrey, the celebrated military surgeon, perceived that many of the German prisoners were completely bald. Surprised, he made inquiries as to the cause of this, and he found that they owed their baldness to the shape—as homely as unhealthy—of their caps. The foul air of their head gear, having no issue, destroyed the vitality of the hair."

Toothache.—There should be a remedy for toothache in every house where there are children. The following is reported by medical authority as reliable: Take of carbolic acid (saturated solution), chloral hydrate (saturated solution), paregoric, fluid extract of aconite—of each one ounce; oil of peppermint, half an ounce; saturate a piece of cotton and pack tightly in the cavity.

Man and his Food.—Of course, various conditions of life, climate and locality, have to do with the quantity of food. Thus, an idle person can get along very well with two and three-quarter ounces of nitrogenous food and 20 ounces of carbonaceous food (flesh and cereal or vegetable food), when, if the same individual were walking or in active out-door life, double this quantity might be used. Perhaps the Esquimaux represent the heaviest feeders in the world, for Parry tells of a young native who devoured in 24 hours 9½lbs of sea-horse—half raw, half cooked—1¾lbs of ship-bread, 1½ pints of water, not counting grog and spirits. Both Sir John Ross and Dr. Hayes, from personal observations, declare that the daily ration of an Esquimaux may range from 12lbs to 20lbs of flesh food. On the other hand, it is quite remarkable how small a quantity of food a man may eat and still retain his health, though, as to the point of mental vigor engendered by scanty fare, that is another question. Cornaro, who wrote a treatise on long life, subsisted for 58 years on 12 ounces of vegetable matter, and 14 ounces of wine per diem, while another case is cited of a man existing for not quite 20 years on 16 ounces of flour per diem, made into some kind of pudding.

Effect of the Electric Light on the Eyes.—The evil effects of the electric light upon the eyes is said to be due to its constant variations of intensity, which give rise to sudden and frequent changes in the pupil, and, consequently, in the "accommodation" of the eye, by which is meant that alternate contraction and dilation of the pupil, by which it suits itself to the variations of light. Such a light, therefore, causes not only muscular fatigue, but also a considerable degree of blurring and indistinctness in the retinal image. The eye suffers both when the light is too dim and when it is too bright. In the former case the object must be brought close to be clearly seen, and an increased accommodative effort is called for, which, in most cases, results in nearsightedness. In the latter case, the simple intensity of the light produces undue contraction of the pupil, and an increase of tension within the eye. This objection has much more weight where carbon electrodes are used, than where the illumination is produced from the incandescence of some intercepting body like platinum or Edison's incandescent carbons.

Treatment of Burns Caused by Sulphuric Acid.—The *Journal de Pharmacie et de Chimie* says that two pupils of the Commonal school of Clermont-Ferrand, were severely burnt in the face while holding sulphuric acid, owing to the rupture of a retort. The author covered their faces with a soft paste made of calcined magnesia and water, and applied in layers of two mm. in thickness. As portions of the coating slipped off, the paste was re-applied. All pain ceased in about a quarter of an hour, and after some time—5 hours in the slighter of the cases, and 24 in the more severe—no further treatment was needful. Their faces show no trace of injury.

A Heroic Remedy for Baldness.—In cases of confirmed baldness the new remedy proposed is to remove the scalp, bit by bit, and substitute, by skin grafting, pieces of healthy scalp, taken from the heads of young persons. The success which has hitherto attended operations of this nature in cases of scalp wounds, gives a promising outlook for this new mode of curing baldness; and perhaps the day is not far distant when the shining pates of our venerable fathers will bloom with the flowing locks of youth.

A Medicated Pillow has been devised, containing receptacles filled with inhalent mixtures suited to different cases, as of headache, bronchitis, catarrh, etc., the fumes of which may be breathed at night, and for which much is claimed.

Peculiar Remedies.—Some of the remedies adopted by modern medical science are peculiar. Fuchsine—a bright, analine dye—was, not long since, recommended in Bright's disease, and now the use of nitro-glycerine, in minute doses, is advised for certain chest affections.

According to the National Board of Health, Vallejo, Cal., is the healthiest city in the United States, and Norfolk, Va., the unhealthiest.

Large Yields from Mines.—The Homestake mine, located in the Black Hills, Dakota, has paid from January, 1878, to September, 1880, $600,000 in dividends; but the Longstreet Mill and Mining Co., of Tombstone, owning the Toughnut group of mines, has paid out in nine months, $450,000 in dividends; and the Western Mining Co., owning the Contention mine, has paid out since July, 1880, the sum of $600,000 in dividends. That is, the Contention has paid out, in dividends, in seven months, the same amount that the Homestake paid out in two years and eight months; so that the showing is very much in favor of the Tombstone district over the one where the Homestake is located. Everything, too, is more favorable for this locality. The climate is finer, no snow storms block up the roads for a third or half the year, and lastly it is only 25 miles from the Southern Pacific, and will soon be in direct railroad communication with it, and so with both San Francisco and the East.—*Tombstone Epitaph.*

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Destroying Base Metal Chlorides; A New Concentrator; A Spray for Mine Galleries Locating Coal Lands; Taste and Odor of Minerals, 17. Passing Events; Assaying Mill tailings; The Indian Gold Mines; Stove Amalgamation; Working Silver Ors With Lead; Recipitants for Gold; The Powder Explosion, 24. Diatoms, 24-5. New Drilling and Boring Machine, 25. Notices of Recent Patents; Highland Springs; The Cinchona Industry; Industrial, 28.

ILLUSTRATIONS.—The National Concentrator, 17. New Drilling and Boring Machine, 25.

CORRESPONDENCE.—Bishop Creek Mines; Trout Ponds, 18.

MECHANICAL PROGRESS.—Purchasing Steel; An Engineer on Faulty Boilers; Zinc Sheeting for Iron Ships; Petroleum as Fuel, 19.

SCIENTIFIC PROGRESS.—The Color of the Sun; United Meeting of British and American Scientists; Defects on the Retina After Death; Formation of Mountains; Storing up Electricity; Speed at Which Wings are Driven; Speaking Tubes not a Modern Invention. 19.

THE ENGINEER.—Tapping Eagle Lake; Underground Railways in New York; The Channel Tunnel; A Railway Tell-Tale; Pumping Machinery; Engineering Inventions; Blowing up Icebergs, 23.

USEFUL INFORMATION.—Oil in Exhaust Steam; Interesting and Valuable; Moth Preventative; Compressed Gunpowder; Cement for Joints; Horschide Belt Lacing; To Upholstery Buyers; White of Egg as a Lubricant; A New Tinner's Tool; Steam Packing; Shingle Roofs, 23.

GOOD HEALTH.—A Barber on Baldness; Toothache; Man and His Food; Effect of the Electric Light on the Eyes; Treatment of Burns Caused by Sulphuric Acid; A Heroic Remedy for Baldness, 23.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Dividends, 20.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Montana, Idaho, Oregon and Utah 20-1.

MISCELLANEOUS.—The Microscope in Geology, 18. Plants Worth Trying in California; Santo Domingo Mines; Magnetic Separation of Iron Sand; Steam Wagons; Mill Sites, 22.

NEWS IN BRIEF on page 28 and other pages.

Business Announcements.

Quicksilver—J. B. Randol, S. F.
Dividend Notice—Standard Con. M. Co.
O'Hara Furnace—Whitney, Veasey & Co, Carson City, Nev.

Passing Events.

To mining men here, probably the event of the week has been the levying of the first assessment on California stock, after it has paid thirty-four dividends. The mine has produced a total of $46,734,831.44 in bullion and paid $31,320,300 in dividends. There is still in the upper levels of the mine a good deal of ore of low grade that would pay for working, but it cannot be taken out at present on account of the gas in those parts of the mine.

The eyes of mining men will soon be turned to the Yellow Jacket, now that active exploring operations have been resumed. They are going for the vein on the 3000 level with a drift, and on the 2800 are making explorations with the diamond drill. The Comstock ought to show us a bonanza again soon.

The country and the world has been appalled by the attack of an assassin upon the life of the President of the United States. Lying in wait for Mr. Garfield the wretched miscreant, Chas. Guitteau, fired upon him in the waiting room of the Washington railway station on Saturday morning. The bullet, fired from behind the President, penetrated his back, pierced his liver and lodged near the skin in front having penetrated his body. For days the President has tarried between life and death and the country has held its breath hoping to catch assurance that he would live and not die. From end to end of the nation there is but one desire, and that is a longing, deep and prayerful, that the people should not be robbed, by a wretch's freak, of its chosen chief magistrate, who has entered upon his course with such determination and manliness, and bids fair to serve the country well by his stand against political evils which are so generally condemned.

Assaying Gold Mill Tailings.

After a gold mill has been running for some time on uniform ore, it is generally pretty well known what the percentage of loss is; but at the same time it is just as well to keep the work checked, not only to prevent carelessness, but to know how the ore, which will always vary more or less, is going.

It is generally of more importance to determine the amount of gold in the tailings than to ascertain by assay the actual product of the original ore; since the quantity yielded by amalgamation on a large scale, added to that present in the resulting sands and stones, will, for many practical purposes, sufficiently represent the total contents of the rock.

It is also desirable to know exactly the amount of gold carried off in the final tailings, in order not only to be enabled to judge of any effect of any modification in machinery or methods, but also, as we have said, as a means of checking results.

When required for this purpose the tailings are caught at regular intervals throughout the day by placing a bucket or some other convenient vessel under the spout from which they will finally make their escape; and when full of water and sand it is placed aside in order to give the matter in suspension time to settle. As soon as the water in the bucket has deposited the whole of the solid matter which is held in suspension, it is carefully drained off, and the deposit, accumulated at the bottom, removed into a box prepared for that purpose.

This is repeated at intevals of about two hours, and at the termination of the experiment, the contents of the box are dried thoroughly and submitted to assay. In the case of samples of tailings thus obtained, the discrepancies between the several assays will, as a rule, have been retained by the blankets and other appliances over which the pulp has passed, and the remaining fine gold is disseminated with a considerable degree of regularity through the mass.

The Indian Gold Mines.

We have before this noted the fact that a number of companies had been organized in London to work certain gold mines in India. Although nearly a year has passed since the formation of these companies, it is only now that some of the results have been made apparent. One of the companies has brought some gold to London, taken from quartz they found lying at the surface of the mine. This result was due to the circumstance that the company, in taking the property, also secured some antiquated machinery manufactured on the spot, which, however, has proved useless for modern requirements. It was sufficiently good, however, to make a preparatory trial, and accordingly 44 tons were passed through the stamps, the result being a yield of 1¼ ounces to the ton; 25% more would have been saved, but for the defective appliances used for its treatment, but enough remained not merely to produce the specimens exhibited, but to encourage the company to proceed with vigor with the erection of their machinery and the development of their mines.

The two bars which arrived at Southampton, weigh 40 ounces, and would realize between £3 15s. and £4 per ounce. It appears to be gold of a very good character, and free from impurities, somewhat darker in color than that in the Australian sovereigns. A larger quantity of quartz would have been treated, but the machinery, as might have been expected, broke down. The new machinery includes 20 stamps, which will treat some 30 tons a day. This news will be of interest to all the shareholders in Indian gold mines, and will come as a relief to them. If 1½ ounces per ton can be realized with machinery of primitive description, and from the surface refuse of the former workers, it is only reasonable to suppose that appliances of the latest description, and quartz taken from the deeper workings, will produce a result far more satisfactory.

Stove Amalgamation.

In some of the colder and more humid districts of Mexico, a modification of the patio process has been employed. The ground ore instead of being exposed in the open air, or a paved court-yard, as in the ordinary patio process, is placed under a shed, and the usual method of patio amalgamation proceeded with, until the operation is about half completed. The ore is then removed into a sort of room termed an *estufa*, or stove, which has under it a fire-place, six or eight feet long, so connected by the side flues with small chimneys as to elevate the temperature of the room containing the ore. Then it is exposed to a gentle heat and allowed to remain during two or three days, when it is again removed and the reduction completed by the ordinary method of patio amalgamation. By this process the time required for the reduction of the ore is less than by the patio, and the yield of silver greater; the loss of mercury, on the other hand, is more considerable.

Working Silver Ore with Lead.

The magnificant machinery with which we now equip our silver mines was not always considered an essential. Perhaps the Mexicans set us pretty good examples in this respect. Their metallurgical appliances were very simple, some of it extremely rude. Probably the most primitive apparatus employed in any country of the extraction, by the dry way, of silver from its ores, was the trufla, a Mexican furnace, which was in principle merely a scorifier, in which the cupellation of the remaining lead is subsequently effected.

The sulphides of silver sometimes occur in so large a proportion, with regard to the gangue with which they are associated, that if finely ground and thrown in a bath of metallic lead kept at a proper temperature, the silver combines with the lead, which, becoming partially oxidized, unites with the silicious and earthy impurities of the slag, which may be readily removed from the surface of the metal before commencing cupellation.

This apparatus, which is much used by the native miners of Somhrerete, consists of a cupel formed of a mixture of ashes and clay, contained in a large coarse earthen dish, enclosed between walls of sun-dried bricks and covered by a dome of somewhat refractory clay, in which numerous holes are pierced.

The whole of the interior of this arrangement is filled with charcoal, on which a blast is thrown by means of a nozzle of baked clay; and although the whole of the heat is applied from above the surface of the lead, it quickly melts, and the scorification of the ore, thrown on the surface, begins.

When the workman considers that the bath of lead has, by the introduction of successive additions of ore, become sufficiently charged with silver, he cleans off the silicious slags, and commences the cupellation of the residual lead. For this purpose he makes an opening at the level of the metallic hall, for the escape of litharge, and continues the operation, at the same time gradually lowering the level of the exit for litharge, until a button of silver alone remains on the bottom of the cupel.

Precipitants for Gold.

In the leaching of gold and silver ores, when the ore contains copper, the waste solution from the tanks in which the copper is precipitated can be used for refilling the vat containing the precipitant for gold, as it contains a large quantity of iron proto-salte, chloride and sulphate. Mr. C. H. Aaron says that the strength must be reinforced with copperas, or acid and iron. The waste liquor from the chlorine generator, consisting partly of manganese proto-sulphate, is also a good precipitant for gold. In order to utilize as much as possible of the chlorine which it contains, as well as any free acid which may be present, it should be placed in a covered tub, or small vat, with some scrap iron. In a day or two the chlorine and the acid will be saturated with iron, thus forming an additional quantity of precipitant.

Other precipitants which yield the gold in the metallic state are, oxalic acid, sulphurous acid, the antimony, arsenic, and copper lower chlorides, and animal charcoal. The latter is used as a filter on which the gold solution is poured, when the particles of carbon become covered with a film of gold. It is patented. In some European works the gold is, or was, thrown down as a sulphide, by means of hydrogen sulphide. This method has the disadvantage of precipitating also copper, and some other metals, if present.

The Powder Explosion.

It will be recollected that on the 27th ult. an explosion occurred in a powder magazine at Tucson, Arizona. The dispatches from there at the time led most people to believe that it was only Tonite powder that blew up. Late advices by mail, however, show that there were seven different varieties of explosives in the building. The warehouse was divided into ten apartments, in one of which was stored a large lot of Giant powder caps and detonators. On the other side of the partition were the different powders, consisting of 17,250 lbs. of Hercules, 12,000 lbs. of Vulcan, 8,500 lbs. of Tonite, 400 lbs. of Giant, 275 lbs. of black powder and 20 lbs. of Dupont sporting. There were, therefore, 30,000 lbs. of nitro-glycerine powders and 8,500 lbs. of Tonite. The superintendent of the Tonite company, who gives us these facts, after having the matter investigated, says that the magazine was built of adobe 18 inches thick, with a partition, also of adobe, 18 inches thick, and the whole covered with a mud roof. Of course it is impossible to know what the cause of the explosion really was, where so many various explosives were in the same room.

THE mountains between Eureka and Palisade, Nev., are almost denuded of the timber that formerly covered them. For years the line of the Eureka and Palisade railroad has been the main source of the wood and coal supply for Eureka consumption. The industry has seen its best days in that direction.

Diatoms.

[Written for the PRESS by HENRY O. HANKS, State Mineralogist.]

A diatom is generally admitted to be a single-celled plant, bearing a singular relation to the animal and even to the mineral kingdom, being considered by some to belong partly to the latter, and regarded as a vegetable crystal, differing only from minerals in having the power of locomotion and of multiplying by separation. Kutzing says: "In comparing the argument which indicats the vegetable nature of the diatomaceæ with those which favor their animal nature, we are, of necessity, led to the latter opinion."

In connection with the idea that the diatoms pertain somewhat to the mineral as well as the animal kingdom, it is a curious fact that silica, deposited from fluoride of silicon, if crushed between plates of glass, and examined microscopically, with a medium power, markings may be seen on the outer surfaces of the vesiclee which resemble those of the diatome, especially pleurosigma and cosoinodiscus. It is also remarkable that Dr. James Blake collected 50 species of living diatoms from a hot spring in Pueblo valley, Nevada, the temperature of which was 163 F. Flint probably originates from diatoms, as does also the silica in certain rocks.

The name *diatom* is derived from a Greek word signifying *being cut in two*. Diatoms resemble the desmids, but differ in having an outer skeleton, or frustrule of silica. The frustrule of a diatom is a silicious box, always in two parts, one slipping over the other like a pill box or with edges opposed.

The thickness of a single diatom is, roughly, the sixth that of a human hair, and its weight is estimated at the 187-millionth part of a grain. Some varieties attach themselves to other bodies as the algæ, while others swim in the water free.

The study of the diatomaceæ aside from their scientific interest is very fascinating. Their extreme and varied beauty is a source of constant pleasure to the microscopist, and the question is often asked, why is so much beauty veiled from human sight?

The Beauty of the Diatoms

Consists in their color, their general form, and sculpture, or natural markings, which characterize nearly all of them. These delicate markings are seen under the microscope to be processes, knobs, bosses, concavities, ribs, groovings and lines, so minute that the highest powers made by the most skillful opticians are required to see them at all; even then, they can only be seen when the apparatus is manipulated by the most skillful operators. The lines of certain diatoms have been measured and are used to test the magnifying and penetrating power of object glasses. A slide called a test plate, has been prepared on which 20 well-known species are mounted, commencing with one on which the lines are comparatively coarse, and ending with one—*amphipleura pellucida*—which has 130,000 lines to the linear inch. For the convenience of study, typical diatoms are mounted on a single glass slide, so arranged that reference can be made to a printed catalogue for the names, while in some cases the names of the species are micro-photographed on the slide.

The diatoms are placed on the plate by the aid of an ingenious device called a *mechanical finger*, by means of which the shells can be picked up singly and given the desired position. *Moller's typen platte No. 1* has twenty-four lines in each of four groups comprising about 500 individuals of 395 distinct species and seventeen genera. The cost, with printed catalogue, is forty dollars.

Some microscopists are so fond of the study of these minute forms, that they scarcely do any other work than to observe, collect, classify and describe them.

When it is stated that the names of more than 4,000 distinct species of diatoms are given in a catalogue published by Frederic Habirshaw, of New York, each of which has some feature by which it may be distinguished, that this vast kingdom, so to speak, is invisible to the human eye, or nearly so, that when highly magnified many of the species are extremely beautiful, and all of them interesting, it is easy to understand why so much interest is taken in them the wide world over, and why every new discovery is heralded, and calls for samples come from the whole scientific world.

It is an established fact, strange as it may seem, that some of the greatest mountain chains, such as the Andes, and the very soil beneath our feet is chiefly composed of the

Remains of Animalcules,

Invisible to the eye, that is to say, the matter has been used by animated beings and returned again to the mineral kingdom, retaining the form which it assumed while a part of their minute bodies. Byron has written with more truth than he probably realized that "The dust we tread upon was once alive," and the remark of Dr. Buckland is often quoted "The remains of these minute animals have added more to the mass of minerals which compose the exterior crust of the globe than the bones of the elephants, hippopotami and whales."

In the tertiary age beds of diatomaceons or infusorial earth were deposited, consisting al-

most wholy of these microscopic organisms. The extent of somo of these deposits is almost incredible, and is regarded as an evidence of the great age of the world.

The Bohemian deposit in Europe is 14 ft. thick and, by the estimation of Ehrenburg, contains 40,000 000,000 diatoms to the cubic inch.

Darwin observed in Patagonia, along the coast for hundreds of miles in extent, a bed of tertiary sedimentary formation 800 ft. in thickness, overlaid by a stratum of diatomaceous earth. At Bilin, in Austria, a bed of infusorial earth, 14 ft. thick, occurs. One merchant sells annually many hundred tons of it. The *Bergh mehl*, or mountain meal of Lapland and Norway, is from beds 30 ft. in thickness. It must be remembered that these deposits extend over many thousands of square miles. Notwithstanding the astonishing fact that vast areas of the earth's surface is built of these minute forms, the true nature of these deposits was not known until 1837, when Ehrenburg published his celebrated work on that subject. The same deposition is taking place at the present time. In certain lakes in the United States and elsewhere, deposits several inches in thickness accumulate, composed wholly of the remains of recent diatoms. When thoroughly dried, a chalky powder is obtained, which, under the microscope, is easily recognized. Similar deposits have been made known by dredging the bottom of the sea.

According to Prof. Joseph LeConte: In the deeper parts of Lake Tahoe which sediments do not reach, the ooze is composed wholly of diatome or infusorial shells.

Dusty showers of a grayish or red color, are not unfrequent on the Atlantic and Indian oceans near the coast of Africa. Ehrenburg examined this dust and found it to consist largely of diatoms. He estimated the quantity let fall during a dust shower in the year 1846, near Lyons, at 720,000 lbs., one-eighth of which was diatomaceous, or 90,000 lbs., equal to 45 tons. Diatomaceous earth may be distinguished from other formations of a similar appearance by its insolubility in acids, extreme lightness, power of absorbing liquids and property of polishing metals. It is instantly recognized under the microscope in the hands of one who is familiar with its use. Diatomaceous earth has its uses as well as its scientific interest. It is largely consumed as a polishing powder, under the name of tripoli, from the locality which first gave it to commerce. It is known in California by the absurd name of *electro-silicon*, and at the East by a variety of trade names. It is a very convenient source of soluble silica, employed in the manufacture of silicate of soda or potash, also known as soluble glass. The manufacture of this compound is simplicity itself. Carbonate of soda or potash, as the case may be, is dissolved in boiling water to saturation, in a capacious iron kettle, and fresh hydrate of lime added until all the carbonic acid is precipitated, and the alkali becomes caustic. Diatomaceous earth in a powdered state is then added as long as silica is dissolved, and the whole covered and allowed to cool. When the insoluble matters have settled, the clear liquid is drawn off and evaporated in a clean vessel to the required density.

Diatomaceous earth is also used in the manufacture of porcelain, and it is a constituent of certain cements and artificial stones. At one time it was claimed to be a fertilizer, but this is thought to be a fallacy, although Ehrenburg states that the fertilizing power of the Nile mud is furnished by fossil infusoria.

Slabs of diatomaceous earth absorb liquids with avidity, and are used in laboratories for drying crystals and filters. This property might be more generally utilized if better known.

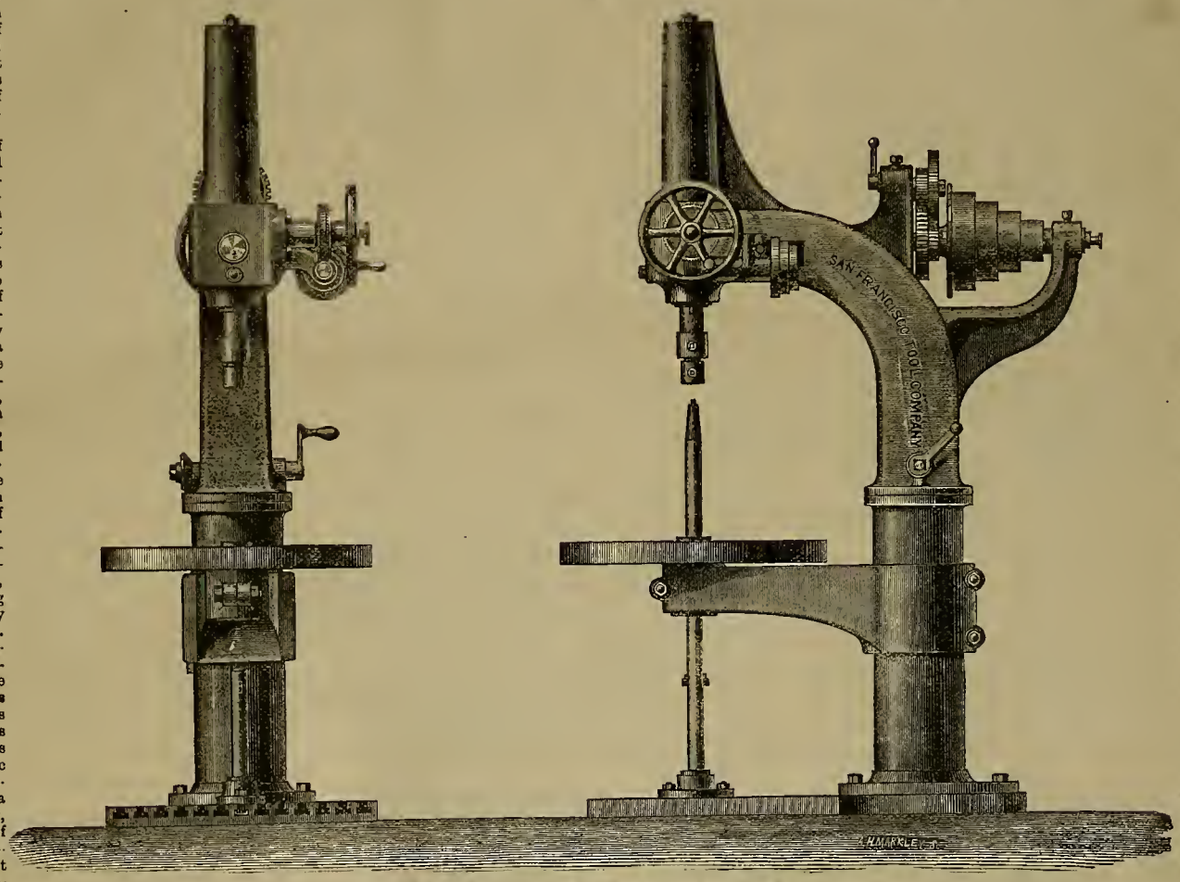
A convenient contrivance for lighting fires is a lump of diatomaceous earth with a handle of stout iron wire. It is dipped into a vessel of petroleum, placed in the stove or fire-place and lighted with a match. It continues to burn safely for some time. It can be used again and again. No person however should make use of it who has not the common sense to carefully set away the vessel containing the coal oil before lighting the match.

Bricks that float in water are made of diatomaceous earth mixed with one-twentieth part of clay and well burned. The art of making these floating bricks was well known in the time of Pliny, but was afterwards lost. It has recently been re-discovered. In the Italian department of Paris exposition of 1878, these bricks were exhibited, which attracted considerable attention. Floating bricks, made wholly of California material may be seen in the State Mussum.

Keiselghur or *"Flint Froth"* of the Germans, from a deposit in Hanover, is extensively used in the manufacture of dynamits, giant powder, lithofracteur, and other explosives. Diatomaceous earth absorbs from three to four times its weight of nitro-glycerine, with the advantage over other absorbents, of retaining the nitroglycerine under greater pressure. Dynamite contains 27%, and lithofracteur 23% of diatomaceous earth.

Before the keiselghur can be used, it is subjected to treatment to remove water, all organic matter and coarse particles. It is first calcined in a succession of furnaces, crushed between rollers, and sifted.

It is claimed that the diatomaceous earths of California are unfit for this purpose, but it is the opinion of the writer that they have not had a fair trial.



NEW DRILLING AND BORING MACHINE.

Diatomaceous earth is largely used in the manufacture of soap, to mechanically increase its detersive power. The Standard Company receive large quantities of it from the southern counties of the State.

It is not to be supposed that all the uses of this remarkable substance have been discovered; it remains for the intelligent inventor to search for new applications.

Diatomaceous Earths are Abundant in California.

Some of them being very interesting. The Monterey deposit has long been known to the scientific world. Dr. James Blake, who has made this subject a special study, thinks that all the California earths are of the miocene age.

The following is a list of the localities represented in the State Museum, samples of which (except the Santa Monica) will be furnished to specialists who make application for them. The numbers refer to the Museum catalogue:

35. Santa Monica, Los Angeles county.
175. Ione valley, Amador county.
240. Los Angelee county.
436. San Gregorio, San Mateo county.
444. San Joaquin valley, near San Carloe ranch.
547. Sea coast, 40 miles north of San Diego.
557. Staples' ranch, San Joaquin county.
654. Ten miles north of Petaluma, Sonoma county.
791. Santa Barbara.
830. Monterey county.
1184. Near Comanche, Calaveras county.
1246. Lost Spring ranch, Lake county.
1284. Santa Catalina island.
1331. Dutch Flat, Placer county.
1448. Port Harford, San Luis Obispo county.
1742. Fourteen miles below San Pedro, Los Angelee county.
1832. Eighteen miles southeast of Santa Rosa, Sonoma county.

Of all those mentioned above, the Santa Monica is the most noted. Slides of this material grace the cabinets of microscopists in all parts of the world, and yet the deposit from which it came is not known. The history of the specimen which furnished so much to science is interesting:

In March, 1876, Mr. Thomas B. Woodward, then connected with the United States Coast Survey, sent a fragment of diatomaceous earth to the California State Geological Society, which he found in tidal refuse on the sea shore, near Santa Monica, Los Angeles county. The piece could not have weighed more than two lbs., and had so long been subjected to the action of the waves that the edges and angles were rounded. The exact locality was two miles southeast of the lagoon, and several miles southeast of Santa Monica. He saw no other sign of a deposit of the earth. The genuine Santa Monica (which name refers to the waif) is now the most interesting of any known, and is prized above gold. Several attempts have been made to discover the origin of the fragment, but so far without success.

The following list of diatoms found in the Santa Monica will give some idea of its prolific character. The list is by no means complete, being only those identified by William J. Gray, M. D., of London, England; Charles Stoddard, of Boston, Mass.; J. H. Engeles, M. D., of Nevada City, Cal.; and Wm. Norris, of this city. The writer will be pleased to receive contributions to the catalogue from any diatomist who may see this article.

Diatome Found in the Santa Monica Earth.

1. Actinophænia splendens.
2. Actinoptychus superbus.
3. Actinocyclus interpunctatus.
4. Arachnoidiscus ornatus.
5. " Ehrenbergii.
6. Amphitetras elegans.
7. Amphitetras Wilkesii.
8. Asteroiampra varisbilis.
9. Asteromphalus Darwinii.
10. Auliscus elegans.
11. Auliscus mirabilis.
12. Auliscus notatus.
13. Auliscus pruinosus.
14. Auliscus racemosus.
15. Auliscus reticulatus.
16. Auliscus sculptus.
17. Auliscus Hardmanianus.
18. Aulacodiscus Browneii.
19. Aulacodiscus Kittonii.
20. Aulacodiscus margaritaceus.
21. Aulacodiscus Oregonensis.
22. Aulacodiscus pulcher.
23. Biddulphia aurita.
24. Biddulphia Johnsoniana.
25. Biddulphia Tuomeyii.
26. Campylodiscus.
27. Chatoceros.
28. Climacosphenia monilligera.
29. Cocconeis parmula.
30. Cocconeis punctatissima.
31. Cocconeis fimbriata.
32. Cocconeis scutellum.
33. Cocconeis splendida.
34. Cocconeis pseudomarginata.
35. Cocconeis Grevillii.
36. Coscinodiscus gigas.
37. Coscinodiscus concavus.
38. Coscinodiscus oculus-iridis.
39. Coscinodiscus subtilis.
40. Coscinodiscus robustus.
41. Cosmodiscus elegans.
42. Cresswellia rudis.
43. Dictyocha (?) varians.
44. Dityium.
45. Discoid forms—rare and very plenty.
46. Euodia gibba.
47. Eupodiscus oculatus.
48. Eupodiscus Rogersii.
49. Endyctia oceanica.
50. Gephyria constricta.
51. Gephyria gigantea.
52. Gephyria incurvata.
53. Gephyria Teifairie.
54. Grammatophora marina.
55. Grammatophora—unnamed large variety.
56. Grammatophora macilenta.
57. Grammatophora serpentina.
58. Goniothecum.
59. Glypodiscus stellatus—4, 5 and 9 processes.
60. Hyalodiscus Californicus.
61. Hemiaulus Californicus.
62. Hercotheca.
63. Heliopelta Leeuwenhockii.
64. Heliopelta Nitida.
65. Isthmia nervosa.
66. Melosira sol.
67. Navicula California.
68. Navicula excavata.
69. Navicula lyra.
70. Navicula nebulosa.
71. Navicula prætexta.
72. Navicula spectabilis.
73. Omphalopelta moronensis.
74. Omphalopelta versicolor.
75. Plagiogramma.
76. Pleurosigma.
77. Podosphenia.
78. Porpeia quadrata.
79. Porpeia ornata.
80. Rhabdonema Adriaticum.
81. Raphoneis.
82. Rutilaria epsilon.
83. Rutilaria obesa.
84. Stictodiscus Californicus.
85. Stictodiscus Hardmanianus.
86. Stictodiscus—new form.
87. Synedra—very large.
88. Stephanopyxis oblongus.
89. Stephanopyxis umbonatus.
90. Surirella.
91. Stauroneis aspera.
92. Triceratium arcticum.
93. Triceratium Monterey.1.
94. Triceratium parallelum.
95. Triceratium—unnamed.
95. Triceratium Wilkesii.
96. Triceratium—large variety of forms.
97. Triceratium, with 5 or 8 angles.
98. Xanthiopyxia—new.
99. Xanthiopyxia oblonga.
100 Xanthiopyxis umbonatus.

New Drilling and Boring Machine.

This week we illustrate another of the machine tools of the San Francisco Tool Company, a double geared drilling and boring machine. The drawing like former ones being in true elevation, conveys an exact idea of the machine, except the feeding gearing, a part of which is enclosed in the main frame.

The method of feeding down the spindles is a new and novel one of great simplicity, admitting ready adjustment, lubrication and removal. By removing two screws the main spindle screw sleeve, indeed, all but the friction feed clutches, can be removed from the machine.

The spindle has a hand movement from two to three times as rapid as is common, and can be raised or lowered almost as quick as by the detachable gearing now applied to same machines. The complicated details thus avoided are among the most perishable details, that have been added to meet a necessity caused by arranging the feed movement so slow that it becomes indispensable to disengage the gearing.

The old column drilling machines of 50 years ago have not been much improved upon. A coarse threaded sleeve and a heavy hand wheel around the spindle is quite as convenient and much more durable and cheap than most of the modern refinements for hand feed.

A new feature of the machine illustrated is that two kinds of feed are provided—a positive one for drilling large holes or in boring, and a yielding one for small drills. The feed motion engages by means of friction clutches, and the thrust upon the spindle can be regulated at pleasure, according to the amount of pressure applied on the clutch.

The various details shown in the engraving will all be understood without description.

The company make several modifications of drilling machines, some of which we hope to illustrate in some future numbers of the PRESS.

CARP IN LAKE.—Lake county will prove one of the best fish-producing districts in America. Schwartz & Webber, near Middletown, in Lake county, are doing well with carp. They have five ponds, the largest covering about one acre, stocked with an immense number of small fry. They are improving and increasing their ponds, and do not expect to rest until they have 14, embracing in all 8 to 10 acres of land. They have an abundant supply of water from a large trout stream (of 40 to 45 degrees in temperature), brought in by a ditch, and the flow regulated so as to keep the water in the ponds at about 80 degrees during the warm season. The fish are growing fast, and next season the guests at Anderson and Harbin springs—within two miles of the ponds—can be supplied with fine large fish, transported alive in tanks if desired. They have found the low, moist, black soil land more favorable for holding water in ponds than the higher red soil and gravel land—and believe Lake county as good as any in the State for fish culture. The proprietors of Anderson springs have taken water from the stream mentioned above, at a higher point, to supply a large pond made upon their former croquet grounds. Carp have also been placed in the very large pond at Boggs' old mill-site, between Glenbrook and Kelseyville.

THIRTY to 40,000 people witnessed the regatta on the Charles river, Mass. The three-mile race was won by Hosmer in 21:16. The double scull race, three miles, was won by Plaisted and Lee in 21:13. John Buckley, of Portland, won the three-mile race for amateurs,

THE CALIFORNIA POWDER WORKS.
MANUFACTURERS OF
Sporting, Cannon, Mining, Blasting and
HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.
PATENTED IN THE UNITED STATES PATENT OFFICE.
ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.
JOHN F. LOHSE, SEC'Y.
Office, No. 230 California Street - - San Francisco, Cal.

GIANT POWDER
MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.
Nos. ONE, TWO and THREE.
Stronger, Better and Safer than any other High Explosive
Judson Powder
IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.
It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞Triple Force Caps and all Grades of Fuse.
BANDMANN, NIELSEN & CO.,
SAN FRANCISCO, CAL.

Excelsior Blasting Powder,
—MANUFACTURED BY—
THE EXCELSIOR POWDER COMPANY.

This is no NEW PATENT NON-EXPLOSIVE SAFETY POWDER, but the GENUINE STANDARD ARTICLE, and as safe to use and handle as any Nitro-Glycerine Powder manufactured. The Fumes and Gases, common in other Nitro-Glycerine Powders, are almost destroyed, and do not leave the miner with headache or nausea. Among the numerous recent testimonials the following is but a fair sample, constantly received, attesting the superiority of EXCELSIOR POWDER:

AUBURN, Cal., May 26, 1881.—EXCELSIOR POWDER CO.: I send you, per Wells, Fargo & Co., a box containing samples of country rock through which I am running our tunnel on the Conrad Mine, and through which we have now run 425 feet, 225 feet of it having been done with EXCELSIOR POWDER. If any one can produce harder rock I would like to see it. I here say that I can do more execution with your No. 2 Powder in this rock than I can with any No. 1 Powder of any manufacture I have ever used, and I have used every kind now manufactured here, excepting "Tonite," and I have had 20 years' experience in blasting. Respectfully yours,
E. W. ROBERTS, Superintendent.

Give this Powder a trial and you will use no other. For Strength and freedom from noxious fumes, it has no equal. Address all orders to EXCELSIOR POWDER CO., No. 330 Pine Street, Rooms 53 and 54, Academy Building, San Francisco, Cal.

VULCAN BLASTING POWDER.
—THE MOST ECONOMICAL AND BEST—
Nitro-Glycerine Explosive in the Market.

In the suit of the Giant Powder Co. against the Vulcan Powder Co. for *alleged* infringement of Patent, it was held that the Giant Powder Patent was INVALID.

Nos. 1, 2 and 3 Vulcan,
Each grade superior to like numbers of any other Nitro-Glycerine Powder in the market.

VULCAN B. B.,
Superior to Black, Judson or any low grade Powder for Bank Blasts, Railroad work, or any work where Black Powder has been heretofore employed.

TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.
The CONSUMER'S COMPANY sell the best Powder at the lowest rates.
Office—218 California St., San Francisco.

GOLD MINERS
WORKING PLACER, GRAVEL AND QUARTZ MINES,
SAVE YOUR GOLD!
—BY USING—
SILVER PLATED AMALGAMATING PLATES.

The most economical and successful process now in use. Will warrant my Plates to save a very much larger percentage of gold than any other method.

SHEET IRON PIPE.

FRANCIS SMITH & CO.,

Manufacturers of

THE PATENT CHANNEL IRON WHEELBARROWS.

THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand

SHEET IRON PIPE.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Arteeian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.

Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

PACIFIC MACHINERY DEPOT.

H. P. GREGORY & CO.,

Nos. 2 and 4 California Street, San Francisco.

Importers and Dealers in every description of

MACHINERY!

Sole Agents for the Pacific Coast for

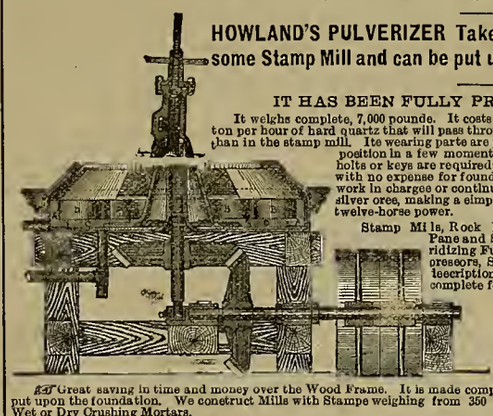
BUCKEYE Engine Company.

J. A. Fay & Co.'s Wood-Working Machinery; Bement & Sons' Machinists' Tools; Blake Steam Pumps; N. Y. Belting and Packing Co.'s Rubber Goods; Sturtevant Blowers and Exhaust Fan; Tanite Co.'s Emery Wheels and Machinery; Payne's Vertical Engines and Boilers; Perry's Centrifugal Pump; Judson's Standard Governors; Dreyfus Self-Oilers; Gould M'fg Co.'s Hand and Power Pumps; Eclipse Windmills; Disston & Sons Circular Saws; Otto Silent Gas Engine; Ducs' Elevator Cups; Ballard's Oak Tanned Belting.
Also on hand and for sale A FULL LINE OF MILL AND MINING SUPPLIES.

MOREY & SPERRY,

MANUFACTURERS OF

Gold and Silver Grinding and Amalgamating Machinery



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!

PATENTS REISSUED 1868.

The "OLD RELIABLE" with improvements, making it

THE MOST PERFECT TURBINE NOW IN USE.

Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

JAMES LEFFEL & CO., Springfield, Ohio, and 110 Liberty St., N. Y. City.

SHINGLE MACHINES AND SAW MILL MACHINERY, STEAM ENGINES, ETC., TO ORDER. MINING MACHINERY OF ALL KINDS.

F. A. HUNTINGTON,
220 Fremont Street, San Francisco.

DuBOIS' Automatic Quicksilver Feeder.

A machine for feeding quicksilver to the mortars of GOLD MILLS. It is so connected to the cam shaft, that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a mechanical movement, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding ordinary hand-feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect. Price complete, $100.00. Send for circular.

P. C. DuBOIS,
18 Fremont St., S. F.

ST. DAVID'S,

A FIRST-CLASS LODGING HOUSE

CONTAINS 113 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the Interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from $2.50 upwards

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

Patents and Inventions.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.]

For the Week Ending June 28, 1881.

243,438.—Pump Valve—J. H. Dunlap, Turlock, Cal.
243,452.—Boots and Shoes—M. Leventritt, S. F.
243,453.—Boots and Shoes—M. Leventritt, S. F.
243,386.—Steam Boiler—J. F. McEntee, S. F.
243,401.—Ore Roasting Furnace—Jas. B. Randol, New Almaden, Cal.
243,402.—Ore Roasting Furnace—Jas. B. Randol, New Almaden, Cal.
243,403.—Ore Roasting Furnace—Jas. B. Randol, New Almaden, Cal.
243,462.—Vacuum Dredge—J. F. Saunders, Ogden, Utah.
243,644.—Shield for Cattle—John Stemmons, Eureka, Cal.
243,647.—Tire Upsetter.—A. A. Still, La Panza, Cal.
243,665.—Rivet—F. Ott, Cambria, Cal.
243,390.—Hydraulic Elevator—W. H. Milliken, S. F.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign, Patent Agency, the following are worthy of special mention:

Pump Valve.—J. H. Dunlap, Turlock, Stanislaus county, Cal. Dated June 28, 1881. No. 243-438. This invention relates to valves for pumps, and consists of a lower, elongated, cylinder, constituting the lower valve, punctured with holes to admit water freely, and moving its length within a plate, having an elevated valve seat, whereby a tight fit is effected, and an upper valve, consisting of a similar cylinder, having four oblong or elongated holes for the escape of the water, and moving up and down within appropriate casing, being limited by a cross pin or otherwise.

Highland Springs.

These springs are charmingly and fortunately situated among the sunny and airy high lands of Lake county, 27 miles northeasterly from Cloverdale (the nearest R. R. station), and eight miles south from Lakeport, the county town. Five hundred and twenty acres are embraced in the premises, which include a dairy, vegetables, stock, hay and grain farm. The springs were first brought to public notice about 12 years ago. At times, 100 to 200 boarders and campers have been quartered here. There are ample and finely shaded camping places. A pleasant grove adjoining the commodious hotel and cottages contains fine croquet grounds, lounging hammocks, and rural seats in shady nooks. The springs and a clear stream are close by. Warm, tepid and cold water baths, from natural and medicinal springs, are supplied free to boarders. A pouring stream and shower bath, of tepid, mineral water, is one of the most decidedly beneficial as well as enjoyable features of the bathing department.

We are aware of no more justly celebrated springs in California. Across the foot-bridge, which spans the creek a few steps from the hotel, is the "Magnesia spring." It has a large flow of tepid water, which, although slightly disagreeable to the taste, is decidedly agreeable to the health of many. A little further along is the "Magic spring," the water of which is slightly warm, but sufficiently impregnated with magnesia, soda, lime, iron and other ingredients, rendering it tolerably palatable. This is freely drank by visitors, especially before eating. It has made remarkable cures from rheumatism, kidney and nervous diseases, and there are many who will bear decided testimony to its wonderful restorative powers. It supplies a large flow of water for the "pouring" and other baths. The "Dutch" spring comes out of a rock a little further down the creek, about 50 rods from the hotel. This gives a small volume of cooler water, highly charged with iron, etc., with a slight after taste, resembling coal-oil. This is also a choice spring and the favorite of many. Most extensively patronized is the Soda spring, situated on the opposite side and more nearly in front of the hotel. Its water is almost universally popular with both pleasure and health seekers. It is also renowned for its curative qualities. Large quantities of it have been bottled and distributed far and near to those who, from time to time, have become acquainted with its restorative virtues and palatable taste. It holds its strength and flavor in a remarkable degree when transported, and ought, in time, to become a popular drink abroad. While it is necessary for persons to visit these springs in order to fairly realize the advantages of the place, it is pleasant for the writer to be able to say that the proprietress, Mrs. Astoria C. Goods, succeeds admirably in rendering to her numerous and worthy class of guests pleasant and homelike accommodations, in a degree affording general satisfaction to them and credit to herself.

"Highland" post-office, located in the hotel, is a real convenience. Mails arrive in 10 hours from San Francisco daily, via Cloverdale. Visitors by this route have 27 miles of staging over a grand and picturesque route. They can return via St. Helena mountains and Calistoga, if they desire further views of wonderful and delightful scenery in Lake and Napa counties.

The Cinchona Industry.

Now that we are in the midst of practical experiments with the cinchonas, and as the College of Agriculture has sent out a number of seedlings for test in different parts of the State, this interest in the subject of quinine production is a direct one to Californians. We see it stated that the Eastern interest in the subject is also growing, not with the hope that cinchonas can be grown at the East, but that our country should do something to ascertain whether some of the varied climates within our national borders cannot do something to augment the failing supply of the famous febrifuge. There was a bill introduced by Mr. Kelly, of Pennsylvania, at the last session of Congress, to start an inquiry and experiment under government auspices, into the practicability of cinchona growing. The bill was lost in the crush at the close of the session, but it may be expected to come up again and will probably receive vigorous support at the East, for there seems more disposition to look favorably upon tests for quinine than upon ventures in tea culture. We trust it may prevail, for with the evidence now in hand there is reason to believe that California should be thoroughly assayed for cinchona qualities.

Cinchona culture in general is progressing. The Philadelphia *Ledger*, drawing its information from foreign sources, says, some of the facts are already known to our readers, others are new. For 40 years England has been industriously engaged in establishing bark plantations in the upland regions of India and Ceylon, the West Indies and wherever it could be ventured on, and the Dutch have been equally busy and successful in Java. Now supplies from these sources are coming regularly to the markets in London and Amsterdam, and the prices got for these East India barks are proportionately higher because they yield a better percentage of quinine, due to the care in cultivation, selection and preparation. We trust this statement is true. It is made without qualification and the market rates is an infallible test for quality in a material of this kind. It has been feared that the quality of bark might suffer under cultivation and by change of condition, and if this fear can be laid aside it will be fortunate. The English authorities have published full reports of their long and varying series of experiments which finally led to the present success, and their scientific journals regularly report the results of analyses of the last importations.

The field for the production of quinine seems open and not likely to be covered by the enterprises now under way. It is said that some of the enterprising planters in Ceylon have gone ahead so boldly, and are so confident of their future, that they have made calculations for a supply that will soon meet the demand, but careful experts, such as Mr. Howard, the leading English manufacturer of quinine, and the other scientific men with whom he is associated in testing the various barks sent to London, rather discourage any such sanguine hopes, and hold the view that the demand is likely to outstrip their efforts. We trust that the matter may be followed up at the next session of Congress and that our representatives will fully inform themselves of the results which have already been attained here, for these will show the opportunity for more general efforts and the promise of success in them.

The Mining and Scientific Press.—This excellent paper of June 18th, comes to us this week, considerably enlarged, numbering 36 pages with numerous illustrations, including a map of Arizona Territory, which is valuable, more particularly at this time as public attention generally is attracted in that direction. The Mining and Scientific Press is one of the most useful papers published on the Pacific coast, and every man interested in mines should not be without so important a medium of information that would soon prove to him its usefulness. Dewey & Co. are well known to the Pacific coast and have probably done as much to advance the mining interests of California, Oregon and Nevada, as all other publishers combined. Subscription only $4 a year, and this number alone is worth that amount to anyone desiring information concerning Arizona, and other valuable matters of interest.—*Mariposa Gazette.*

Commendable Enterprise. — The public-spirited and energetic publishers of the Mining and Scientific Press, Dewey & Co., 202 Sansome St., San Francisco, have just issued an Arizona edition of their paper, 36 pages, replete with the most entertaining and instructive communications on this latest scientific topics of the present century, amongst which are — "The Brush Electric Light," "Contributions to the Geology of California," "The Old River Beds of the Sierra Nevada, of California," besides a large number of intelligently written articles about the rich and extensive mineral resources of Arizona, with an accurate map of that new El Dorado. Every miner that wishes to keep pace with the times, should be enrolled as a subscriber for this valuable scientific journal.—*Mountain Messenger.*

Industrial.

There has been no time since the exactions of the late war when good workmen were in such demand throughout the country as at present, and the business outlook in almost every branch of industry is most encouraging. The large present demand for shop nutbits furnishes good evidence of the general prosperity of our manufacturing interests. Orders in that line during the past year have been received from almost every quarter of the globe. Mexico, Russia, and even England have recognized the fact that our mechanics excel in machine tool work by sending orders for the same.

Wood working machinery is in special demand, and some of the manufacturers of that class of machinery are "crowded and overwhelmed with orders."

English and American Railway Cars.—English papers are beginning to speak more generally in favor of the American system of railroad car building, and well they may! To say nothing of the superiority of the general arrangement of our cars, it is well known that, as a general thing, the English railway carriage, when thrown from the rails, usually goes all to pieces, photographs of such wrecks showing that they commonly consist of a confused pile of panels and doors, with broken ironwork and shattered framing. A good American car, honestly built, can be thrown against a solid obstruction at a speed of 25 miles an hour without breaking up; and if it was not that the passengers are thrown about and brought in contact with seat backs and the hanging work on the ceiling and sides, an accident of this kind would rarely be attended with exceptionally serious consequences, whatever the speed. English companies are also adopting the American method of supporting long passenger cars on "hogis trucks."

The Fairbank's Scale Works of St. Johnsbury, Vt., are said to be making 30 tons of iron per day, and are still far behind their orders. Since 1880 came in they have averaged over one railroad track scale for each working day.

Copper Products.—The close of the year 1880 showed that the copper mines of Lake Superior, since their commencement, have produced 300,000 tons of ingot copper, valued at over $140,000,000.

Exports.—During the past five years the excess of exports in the United States over imports, has aggregated $900,000,000. Our imports from foreign countries have fallen in five years from $1,450,000,000 to $1,425,000,000, while our exports to Great Britain increased from $340,000,000 five years ago to $455,000,000 last year.

The Mississippi River Trade.—The geographical position of New Orleans is beginning to assert itself. It is now the second port of export in the country. Some idea of the growth of the grain movement from St. Louis to the seaboard at New Orleans in barges, may be gained from the fact that from January 1st to October 16th, of last year, the shipments were 13,914,000 bushels, as against 6,164,838 bushels for the corresponding period of the previous year. For April the total exports of New Orleans exceeded $11,000,000, the exports of Boston for that month being about $6,000,000. The Nashville *American* thinks that the entire Mississippi valley will eventually pour its immense trade into New Orleans.

News in Brief.

Earthquake at Hanford on the 3d.

There are only 45 prisoners in the Utah penitentiary.

The total acreage in vines in Napa county is about 12,000.

Santa Claus, the California horse, was defeated at Rochester on the 5th.

The army worm has just made its appearance at Lower Soda Springs, Shasta county.

A number of the retail butchers of this city have organized a Mutual Protective Union.

The opera house and 12 other buildings at San Jose, were destroyed by fire on the 4th.

There are 300 men in the woods at the head of the Yakima, W. T., getting out railroad ties.

The *World* says: There is no longer a doubt that the infant heir of the Duke of Norfolk is blind.

Chinamen are catching spring salmon on the Columbia river, near Clifton, Oregon, with hook and line.

The silver ledge recently discovered at Orcas Island, W. T., is creating considerable excitement.

From 200 to 250 tons of refined sulphur are shipped every month from the Humboldt Co.'s works, near Winnemucca, Nev.

France has determined to mobilize 100,000 troops and send them to Africa to put down the insurrection with a strong hand.

Hamilton Disston, the Philadelphia saw manufacturer, has bought 4,000,000 acres of land in Florida. It will be reclaimed and colonized.

The proposition to levy a special tax of $12,000, in Seattle, W. T., to build new school houses, was voted down by the people of that district.

By the 1st of August a full force will be put on at Carson and coining resumed. The mint has been accumulating bullion of late, and now has 300,000 ounces on hand—enough to justify resumption of active work.

The surveyors are at work in Sierra valley staking off the Plumas branch of the railroad which is to run through the valley. It is a branch of the Nevada and Oregon railroad, which runs from Reno north.

The Indians of the Swinomish Reservation, immediately opposite La Conner, W. T., have nearly completed a dyke by which over 600 acres of tide land will be reclaimed, at an expense to the government of $400.

The life-saving station at Bolinas bay, as to the buildings, nearly completed. It is situated on the beach at the foot of the street which runs through the town, and is expected to be fully manned and equipped by August 1st.

The Arabs of Sfax, Algeria, have driven out the Europeans and have occupied the forts. If the forts are not surrendered the French will bombard them. The Arabs have pillaged Sfax, and 3 persons were killed and 20 wounded.

Observations made lately at the Davidson Observatory show that the comet in the northern sky is rapidly speeding away from the vicinity of the earth. It no longer disappears below the horizon, but retains its position high in the northern heavens all night. The spectrum shows the same peculiarities of composition as formerly. In the morning skies Venus, Jupiter, Mars and Saturn still form a very brilliant galaxy, with Capella to the northward and the comet apparently flying from the Pole star.

The slipshod manner in which the boundary lines of the military reservation have been established in Arizona is working a hardship to many stock and ranch men, who through ignorance have been so unfortunate as to settle upon them. Col. Carr, commanding officer at Fort Lowell, recently served notices on all settlers upon the military reservation to move off at once. A similar order has just been issued by the commanding officer of Camp Huachuaca military reservation.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. F. Osborne—San Francisco.
A. C. Knox—Napa and Lake counties.
O. W. McGrew—Santa Clara county.
M. P. Owen—Santa Cruz county.
J. W. A. Wright—Merced, Tulare and Kern counties.
Jarvis C. Hoag—California.
B. W. Crowell—Yuba and Sutter counties.
D. W. Kelleher—Solano and Sacramento counties.
Geo. W. Fahrion—Plumas county.
Otto H. Hopkins—Amador county.
A. Leonard Meyer—Utah and Idaho Ter.

Important additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Persons receiving a sample copy of the Mining and Scientific Press *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We will send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

Anderson Springs, in Lake county, 19 miles from Calistoga (over a grand, picturesque route, via Mt. St. Helena) are among the best in this State. They are situated in the midst of a natural park, full of beauty and interest to the naturalist. Good home-like accommodations at reasonable rates are invariably furnished by the Andersons family.

How to Stop this Paper.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

Bound Volumes of the Press.—We have a few sets of the back files of the Mining and Scientific Press which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

Sample Copies.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

The State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry O. Hanks, State Mineralogist.

By Telephone.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

Copp's "U. S. Mineral Lands, Laws, Forms, Instructions and Decisions."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

Good Type Writer for sale at a Bargain. Call at this office. Dewey & Co., 202 Sansome street, S. F.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company,

SAN FRANCISCO, JULY 2, 1881.

At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 30), of Seventy-five (75) Cents per share was declared, payable on TUESDAY, July Twelfth (12), 1881, at the office in this city, or at the Farmer's Loan and Trust Company, in New York.

WILLIAM WILLIS, Sec'y.

Office—Room 20, Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

Arizona Mexican Mining Company.—Lo-

cation of principal place of business, San Francisco, California. Location of works, Globe District, Arizo a

Notice is hereby given, that at a meeting of the Directors, held on the 7th day of June, 1881, an assessment (No. 1), of Fifty (50) Cents per share was levied upon the capital stock of the Corporation, payable immediately in U. S. Gold Coin, to the Secretary at the office of the Company, Room 33, No. 320 Sansome St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of July, 1881, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 8th day of August, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

GEO. R. ADAMS, Secretary.

Office—320 Sansome St., Room 39, San Francisco, Cal.

ANNUAL MEETING.

GOVER MILLING AND MINING COMPANY.—The regular Annual Meeting of the Stockholders, for the election of a Board of Directors, will be held on Tuesday, June the 14th, 1881, at 2 o'clock, P. M., at the office of the Company, No. 402 Front street, Room 8, San Francisco California. W. O. WILSON, Secretary.

Steep Hollow Gold Mining Company.—

Location of principal place of business, San Francisco, California. Location of works, Liberty Hill Mining District, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of June, 1881, an assessmeot (No. 6), of $1.50 per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of July, 1881, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the 18th day of August, 1881, to pay the delinquent assessment together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. PEW, Secretary.

Office—310 Pine St., Rooms 15 and 17, San Francisco, Cal

DIVIDEND NOTICE.

San Francisco Savings Union,

532 California St., corner Webb.

For the half year ending with June 30, 1881, a dividend has been declared at the rate of five and one-tenth of one per cent (5 1-10) per annum on term deposits, and four and one-fourth of one per cent (4¼) per annum on ordinary deposits, free of Federal tax, payable on and after Wednesday, July 13th, 1881. LOVELL WHITE, Cashier.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half year ending this date, the Board of Directors of The German Savings and Loan Society has declared a dividend on Term Deposits at the rate of five and one-tenth (5 1-10) per cent per annum, and on ordinary Deposits at the rate of four and one-fourth (4¼) per cent. per annum, free from Federal Taxes, and payable on and after the 11th day July, 1881. By order, GEO. LETTE, Secretary.

San Francisco, June 30, 1881.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, $7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, implements and working apparatus.

As it is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, $3.00 coin, postage free.

This paper is printed with Ink furnished by Chas. Eneu Johnson & Co., 509 South 10th St., Philadelphia & 59 Gold St., N. Y. Agent for Pacific Coast—Joseph H. Dorety, 52 Commercial St., S. F.

SCARCE GOODS.—Books, Photos, &c. Samp. Catalogue 3c. Paris Book Co., Chicago, Ill.

THE O'HARRA CHLORIDIZING FURNACE.

Patented in 1878.

SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1 10 per ton to work 40 tons in 24 hours.

At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61¼.

Lewis Chalmers, of the Isabella G. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS. roasting and chloridizing at the figures there given, antimonial and arsenial sulphurate of silver up to from 84% to 95% of the assay.

DEWEY & CO.'S
Scientific Press **Patent Agency.**
[ESTABLISHED 1860.]
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Pateut Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examiuation of Patents already granted, for the purpose of determining the patentahility of inventions brought before us, enables us often to give advice which will save inventors the expeuse of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

"THE $1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently lutroduced Grip, and also the Spring Attachment, which replaces the Weight herctofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking-table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic c ontrivances will not answer the purpose for wet or sticky ores.

The Challenge Ore Feeders are now in Use in the following Mills, besides many others

Superiority of the "Challenge" Ore Feeder Demonstrated!

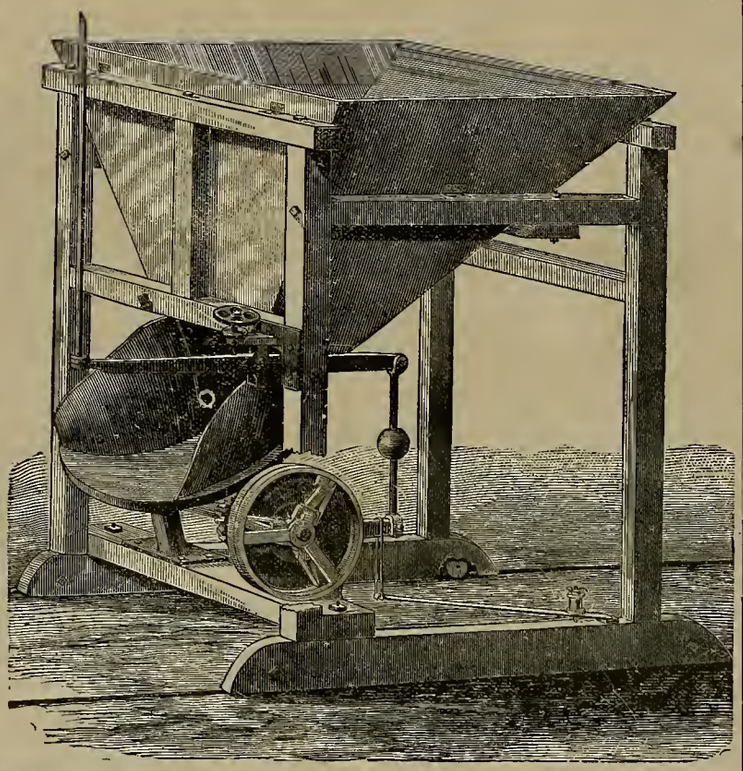
At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" eeders, but after a few weeks trial they were pronounced adequate to the work, discarded, and the "Challenge" dopted.

The "Silver King," Mill of Arizona, also removed the 'Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill, of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.



These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

Mr. H. W. GREENWELL, of the Tingman Mine, El Dorado Co., or any other person can make $1,000 by disproving the acknowledged superiority of my "CHALLENGE" Feeder, in a competitive trial, side by side, with any other Feeder, on wet or sticky ores from any mine, and I will give $100 to any one who will procure the acceptance of this challenge, and arrange for a fair and impartial test on merit.

I mean business, Gentlemen, "either put up or shut up."

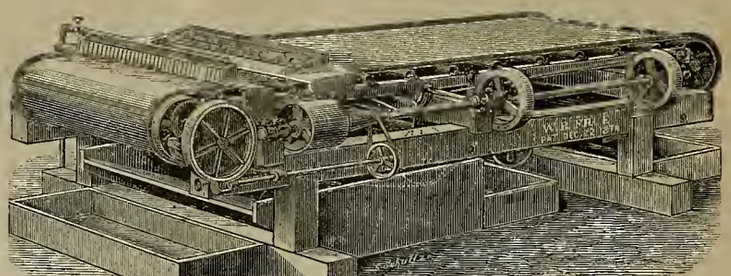
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Over 250 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and the concentrations are clean from the first working.

The wear and tear are merely nominal; the water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

ADAMS & CARTER, Agents, Room 7, No. 109 California Street, S. F.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 58.

CALIFORNIA Electric Light Company.

Owners of the Brush System of Electric Lighting for the Pacific Coast.

Apparatus for sale for Mines, Mills, Manufactories, etc.

Plating Machines and Machines for treating Ore manufactured to order.

Electric Light furnished on all the principal streets of the city.

Office—No. 119 O'Farrell Street,

SAN FRANCISCO, CAL.

PEBBLE SPECTACLES.

Muller's Optical Depot,

135 Montgomery St., near Bush.

SPECIALTY FOR 30 YEARS.

WHOLESALE AND RETAIL.

The most complicated cases of defective vision thoroughly diagnosed, free of charge. Compound Astigmatic Lenses Mounted to order, 2 hours notice.

VOLUME XLIII Number 3.

Desulphurizing Compound for Ore.

Experimeuts are uow heiug made iu this oity with a process for extractiug precious metals from their ores, which was patented hy the late Thoe. C. Clark, and aesigned to Jamce Stratton and Richard E. Coady. It is desigued to perform the dieiutegratiou and desulphurizatiou uf ores eo ae to hriug the ore iuto proper couditiou for easy pulverization, and the precious metals iuto suitahle form for amalgamatiou, hy freeiug them from the uuiou aud iufluencs of haeer metals.

The ore ie first cruehed iuto pieces ahout as large as ordinary Iudiau coru. That portion coutaiuiug sulphurets geuerelly becomes fiuer, eince it is more friahle. The ore, after heiug crushed es deecribed, is placed in an ordiuary roasting furnace. After being roasted for a euitahle length of time, ths heat is raiced eo the eulphur will hurn freely, after which the heat ie lct down agaiu, a free supply of oxygeu heing furuishsd duriug the whole prooess of roasting.

After the ore hae become dead and lies like sand in the furuace, aud uo more scintillation ie appareut, it is heated up to a good red heat, hut uot made too hot.

Iu a suitahle recsptacle heeide the furnace is plaecd a cold hath, into which the ore is drawu while hot. This hath ie formed of a peculiar solution, differiug iu composition from the eolutious usually used for this purpoee. The red-hot ore heiug drawn iuto the cold eolutiou, it ie claimed that a complete desulphurizatiou is effected as well as a dieiutegratiou.

Where there is a higher percentage of eulphur in the ore, the proportious of the solution are altered to suit the requirements of the particular class of ore. Mr. Clark was, of couree, aware that it was not new to roast ore aud dump it while hot iuto cold water or into cold solutiou. He ouly claimed to iuveut a eolution or compouud cousidersd euperior to those previously used for the purpose.

Lubricators for Air Compressor Cylinders.

Robert F. Grigshy, of Roeario, Mexico, has juet received a patent, through the MINING AND SCIENTIFIC PRESS Pateut Ageucy, for a novel method of lubricating the working parts of the cylinders of air compreesore. It consists in the application and arrangemeut of a seriee of pipee, hy which the circulation is effected, aud a tank, where tbe luhricaut is placed, which receives the waete from the cylindere, aud from which the lubricant is pumped into the air-receiving tauk to he forced iuto the cylinders. With the coudeused or pure watsr in the tauk ie mixed ore. Carhouate of soda aud borax, or other suitahle substancee, which will form a luhricant aud preserve the cyliuders from oxidation, may be added. The proportious ueed may be varied, hut Mr. Grigshy has found the following to he very effective: Water, 900 parte hy meaeure; oil, 94 parte; carhouate of soda, five parte; horax, one part. Theee proportioue may he varied without detriment to the workiug. In order to introduce the luhricaut, either pump or pipes are employed, hy which it can he forced directly into the cylinder, or it may he pumped into the lower part of the receiving tauk and distrihuted to the cyliuders hy the pressure of the air.

Mr. Grigshy says that he has fouud the compound here deecrihed to he very efficient, keeping the cylindere perfectly luhricated, and with a high polish upon them, and the interior never hecomee oxidized. Coudeuced or pnre water, with about 10% of oil ouly, givee good reeulte. The water and oil heing, ae it were, ground together hy the constant motion and producing a mixture of a milky appearance, with which the interior of the cylinders are kept sluehed all the time. By thus mixiug, the waetege is very small, heiug only what is due to evaporation.

THE Text district, discovered last cummer, aud which is eituated in the Birch Creek mountains, 17 milee from Steveneon'e Junction, on the Lemhi river in Idaho, ie becoming prominent as a mining camp of great promise.

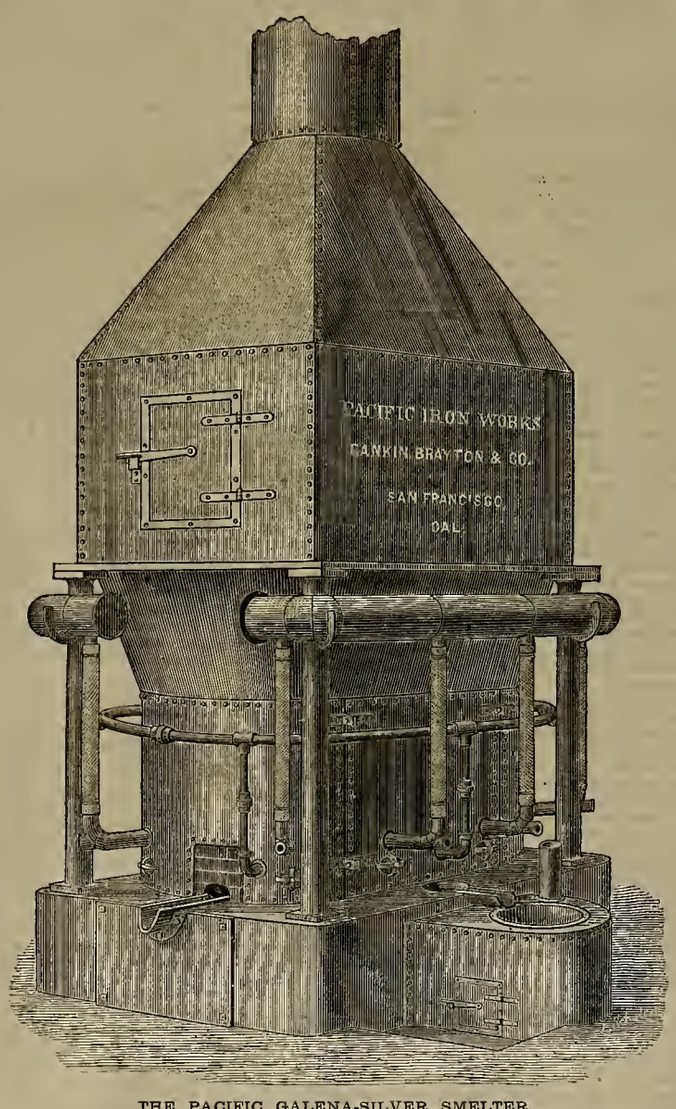
The Pacific Galena-Silver Smelter.

A large proportion uf the miuee uuw being dsveloped iu the uew miuiug dietricts of our great mineral helt, ars carrying a class of carbouate aud oxide ores tbat require to be treated hy the emelting process. This intereet, iucluding hoth galena-eilver aud copper, has already become oue of euch magnitude, that the queetion of the most thorough and economical treatmeut of theee oree is oue of the highest importance, aud all improvemente teuding to lsssen the cost of reduction are watched with great interest hy a large clase of our miuiug population.

We illustrated in a late iseus a etyle of copper smelter that has attained a marked euccess in that branch of work, and now present our readers with an illuetration of a galeua-eilver emelter, huilt hy the same firm, Messrs. Rankin, Brayton & Co., of the Pacific Iron Worke, which poeeeeee eo many advantagee, that it may fairly he considered as the most improved type of galeua smelter in uee.

The epecial advantages of thie etyle of emelter may he enumerated as follows: The water jacket is made in four eectione. This greatly facilitates traneportation and eettiug up. In caee of accideut only oue sectiou ueed ordinarily he replaced. The sections are made eo that auy of them can be rsmoved without any disturhauce to the reet of the furuace, makiug all parte readily accessihls for clsaniug out or repaire wheu neceseary.

Circulatiug plates are riveted into each sectiou iu euch a way as to seoure a rapid circulatiou of water. This preveute auy ecale from forming ou the iuuer eurfaces of ths plates, reduces the temperature, leesene the liability to injury from overheating, aud adds greatly to the wear of the jacket.



THE PACIFIC GALENA-SILVER SMELTER.

No brick or etone-work ie required in conetruction except for the foundation, which can he made of such stoue as can he found in sny locality. Those familiar with the places where theee works are geuerally put up, can appreciate the great saving in expeuse and time euch an arrangement makes. Both ends are provided with charging doors aud slag discharges, which tend greatly to facilitate these operations. A boiler-iron foundation and curh are provided, inside of which the whole structure is huilt. This is to prevent any escape of hullion in caee of leakage from the crucible, which often occurs, involving great loee without euch a provision for saviug it.

The lead well ie located outeide the jacket into which the metal ie ruu aud kept hot by a small fire, until the dross aud other impurities can be skimmed off, hsfore heiug ladled iuto the molds. Thie arraugement, ae made, is peouliar to this furnace, aud greatly facilitates the production of a clean aud high-grade hulliou. Ths tuyeres are made in the jacket, aud beiug surrounded hy water, uever hurn out. The ehape of the jacket and the arrangement of the tuyeree are such as to provide against dead ceuters, secure perfect combuetiuu aud the most ecouomical reeults from fuel. Downcaste, made with eteams jets to coudeuee the vapore and save the fiue duet from the etack, furuished wheu desired. This furuace, as constructed, ie the reeult of mauy years of cloee etudy and praotical experimeut, aud the remarkahle reeults ohtained from it regardiug capacity for continuous work, minimum coet for repairs aud ecouomic production of hulliou muet, we thiuk, eecure its geueral adoption. They are made of any size deeirsd, from 20 to 60 tous daily capacity.

The Utah Mine.

The annual meeting of the Utah mining compauy wae held this week, 17,538 sharss being represented.

The annual report of tbe Secretary was approved aud ordered to be placed ou file.

The followiug Directors were elected: R. H. Follis, John Skae, George Wallace.

At a meeting of the uewly elected hoard of Directors, the following officers were elected: Preeident, R. H. Follis; Vice-Preeident, John Skae; Secretary, G. C. Pratt; Treasurer, Nevada Bank; Superiuteudent, A. G. McKeuzie.

The expendituree for the year were $160,104, of which $24,858 were for eupplies, $81,815 for salaries aud wages, $29,433 for wood and timher. $4,319 for ice and water.

The receipte were mainly from aesesements, three of $40,000 each, haviug heeu levied.

The Superiuteudeut, Alex. C. McKeuzie, makes a report from which we extract the followiug:

The main iuclinehas heen suuk and timhered a dietance of 530 ft., paseing through a favorahle foot-wall formatiou; alteruating iu ite character, and at timee very hard. The hottom of the iuclius hae uow reached a poiut 25 ft. helow the 2,350 level. Sinkiug will he contiuued aud pnehed as rapidly as possihle until the 2,500 level ie reached, when a drift will he started eaet to a couuection with the north drift uow heing run from the Union Con. aud Sierra Nevada mines. Thie work, when completed, will secure excelleut ventilation and make development work poesihle in a large space of nudeveloped couutry. There hae heen 1,790 ft. of drift run in the mine duriug the past year, showiug uothiug more valuahle than a well defiued vein formatiou which shows a very decided improvement in character ae depth is acquired. We are uow eugaged in repairing aud cleaning out the old drifts on the 400 level. Work on this level wae neceeearily ahandoned some years ago, caueed hy the findiug of heavy flows of water, which at that time interfered with the siuking of the shaft aud other operatiue in the mine. This difficulty ie now overcome through the henefit of the line of pipes laid from the mine to the Sntro tunnel. No reaeonahle flow of water from this level can poesihly interfere with the lower workinge of the mins.

All the machiuery and everything appertaining to the miue is in firet-clees conditiou.

AT the annual election of the Beet & Belcher the following officers were choeen: Preeident, George Congdon; Vice-President, R. H. Follis; Solomon Heydenfeldt, Robert Sherwood and George Wallece. William Willie wae choeen Secretary, and R. H. Penoyer, Superintendent. There were 75,738½ shares repreeented. The mine wae $5,694.39 in debt July 1st.

THE Pinal (A. T.) *Drill* saye: Nearly all the teilings at the Windsor company's mill, Pinal, have been worked, and produced over $10,000 in hullion. When the new roeeter is in place they will commence with a fresh eupply of chemicals on $200 ore, which they are hringiug from their Mount Visw mins.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

The Owens River Country.

Editors Press:—Owens River, as a mining camp, has so long remained dormant that it is with pleasure that your correspondent can add much again to its good report.

The Pajaro mine—ths rich gold mine that I mentioned in a previons communication—has assumed gigantic proportions, and will go far toward dispslling the idea that the mines of this ssction, or, more properly speaking, the central portion of the White Mountain range, are not permanent. The mine has now become the property of W. H. Lent, Jr., and all who have seen ths mins, say that one month's run of a 10-stamp mill will enable him to clean up all, or more, than he paid for the mine. From the present appearance of the mine, this does not look like an exaggeration, ae they have a ehaft, 7x7 ft. in size, down 100 ft., and entirely in ore, the sides of the shaft touching neither wall. The last 50 ft. was entirely in picking gronnd. They have over 50 tone of ore on the dump, every pound of which ie rich in free gold, and will mill over $75 per ton. No doubt a mill will be soon put up, and the life-giving eound of its etamps reverberate through the valley.

The owners of the large

Silver Ledge in Piute District,

And known as the Maud S., are steadily at work einking their incline; are down some 35 ft. They are taking out ahout 10 ft. of the ledge, leaving 2 or more feet, next to the hanging wall, as roof to the incline. They have a very fine showing of ore, and a constant improvement, both in quality and quantity. This mine has the largest and best defined croppings of any mine in this region, and hy far the largest that I have seen on this side of the Sierras, as they are discernihle hy the nakèd eye for a dietance of 15 miles or more. The present ownere, Ross & Co., were very fortunate in diecovering a hody of ore in the croppings of the main portion of the ledge, that had heen overlooked by former parties. All work had been done heretofore upon the eastern portion of the mine, where there was a larger ehowing of free gold, and at that time, 1864, thought to be more valuahle as a mining project; but the present development ehows it to be a valuable mine for silver alone.

As the mining interest of this section is so rapidly reviving, I will mention

A Few of the Leading Companies.

In Piute district, a merchant of Bishop creek has two men at work on a gold ledge; Horton & Merriman on a carbonate ledge; also, Nevins & Co. upon several ledgee of carbonates and galena, and several other parties prospecting and working on a emall ecale.

In Bishop Creek district, H. H. Buckles and associates are at work upon a gold ledge that was located in early days, and afterward shandoned. It still retains its old name, Golden Wedge, and the present ownere have evidently found the true vein, some of the ore being worth a half dollar per pound. They propose to sink their shaft 100 ft. hefore stopping.

Giles & Wren are also at work upon a gold-bearing ledge. Keyes & Briggs, Whits & Co., and several others, are at work upon galena and carbonate ledges. Other partiee, too numerous to meution, are at work in the vicinity of the Pajaro mine, in the not unfavorable hope of securing another bonanza.

The majority of the above mentioned parties are experienced miners, far different from those that overran the conntry 18 years ago, and they are evidently meeting with euccess, judging by the ore that they bring in and the persistence with which they cling to work. When their devolopmente reach proper proportions, I will report the condition and appearance of their mines.

Let us take a retrospective view of this mining region, and discover where it stands, or, rather, ehould etand to-day.

The White Mountain and Inyo Range

Ie the chief mineral-bearing belt contiguous to Owens River valley. These two mountain ranges are one and the same, eacb being a continuation of the other, and together form a chain about 150 miles long, and extending from Owens lake on the south to a point about 20 miles due west of Candelaria, in Nevada. That this entire range is one unhroken belt of mineral would be nonsense to presume, but it has its many changes of formation similar to many other mountain ranges upon the globe.

It is true, in early days, hefore Aurora broke down, Owens River prospectors—not miners—were heard to epeak of Owens River as a continuation of the Aurora belt, and, no doubt, many at the present time, can trace, in imagination, a relationship with the Bodie belt. Be that as it may, the White Mountain and Inyo range has turned out some good mines, of varied character, many of which are etill producing.

The Carbonate Mines

Of Cerro Gordo, and the gold mines of Beverage, on the southern portion of the Inyo range, and the old minee of Montgomery district, and the Indian Queen—a sulphuret-hearing eilver mine, on the northern portion of the White mountain—are all profitable mines.

The question may hs asked: Why have ths mines of Bishop Crsek, or the middle portion, heen left so long idle? As we are taking

A Retrospective View

Of this locality, we will try and make it clear. The explanation could hs given in the single compound word, "wild-cat." It will he remembered hy many of your readsrs, that from 1860 to 1866, quartz mining excitement ran very bigh in all parts of the country. In San Francisco, mining brokers' offices sprang up like magic; mining companiss were formsd hy the thonsands, and their certificates of stock sold at all figures, from a fsw cents to as many dollars. Everybody hought, for all could bs accommodated. Then came a rsaction. Everyone wanted to sell, but there were no huyers, for all had stocks to sell. Then came the levying of assessments upon the stock of half developed mines. No collections of assessments could he made, as no one wished to further advance money in an undsrtaking where the indncements had hsen hsld up so favorably, and ths reports so meager. Thus, no money forthcoming for the working of ths mines, they were left in a half developed condition, and often reported to the office in San Francisco as worked or pinched out, and were consequently ahandoned.

Thue it hecame, as early as 1865, a common report on the streets of San Francisco, that the mines of Owens River and vicinity were not permanent; and thie without a thorough test of the mines. It was a common ironical expression of men, upon their return here, that there was more mining dons on Montgomery St. than in the mines themselves.

I could mention several such wild-cat companies, that operated on Owens River, and ehow their abandoned works, where they spent emall eums of money, and where it did nothing toward developing their mines. It was simply wild-cat scratches, and nothing more. Several of

These Abandoned Mines

Have heen located recently, and I have seen assaye from several that range from $40 to $300 psr ton, and that from well-defined veins, in some iuetances of 2 or 3 ft. in width, and with prospect holes eunk no more than 5 to 20 ft. in depth.

There were scoree of such mines located and trifling work done, and the word passed around that Owens River was a failure. How could such an opinion be justly passed, based upon such flimsy work.

The questions may be asked: Why is

Owens River Starting up Afresh,

Aud what has she now to ehow, more than formerly, to guarantee the permanence of her mines? Also, why have her mines lain so long idle since the passage of the laws of 1872, when the title to these abandoned mines reverted to the Government?

Shortly after the passage of the law of 1872, Panamint, followed by Darwin and Lookout, drew all the floating population away from this section; then shortly followed Bodie and Mammoth, and none were left in the valley but the farmers, teamsters, cattle raisers and tradesmen, and they were too busy or disinclined to devote their time and means to the development of mines, and it was left for the accidental displacsment of a rock, by a Mexican's pack mule, that led to the discovery of the Pajaro mine, to draw a score of experienced miners from the different districts around, and they, with knowledge gained by hard work, pronounced it a good field for prospectiug, and evidently are meeting with euccees.

In no instance have I heard or seen a mine where they have found the bottom, and in the majority of mines the ledges have widened. The most noted, the Pajaro gold mine, at the surface was 5 ft. wide; at 50 ft., 7 ft. wide; and at 100 ft., the width is not known; probably more than 10 ft. The Maud S. silver mine, at the surface, was 8 ft.; at 20 ft., 12; and at 35 ft. is over 14 ft. in width; and it ie a common answer of the miners, when asked the condition of their minee, that they are widening.

In conclusion, taking into consideration the present appearance of the mines, and noting the ineignificance of the work done upon many of them in early daye, it would appear to any thinking mind that Owens River has now a bright future before her, and that ehe had suffered more than her just proportion from the evil effects of wild-cat mining sohemes.

Concord.

Bishop Creek, July 2, 1881.

Inter-Mercurial Planets.—No. 2.

Editors Press:—With your permission, while the subject of inter-Mercurial planets is fresh in the minds of some of your readers, I would like to add eome remarks which I could not reach in my former letter, and which has led me to make important modifications in the periods in exact accordauce with the displacement of the nodes.

I find, too, that there are points strengthening the 33-day theory, or a modification of it, that I had overlooked throughout the inquiry, which I have been following up at intervals for years. Althongh Leverrier's approval of 33 days, was noticed in the *Scientific American* of Novemher 18, 1876, immediately after Mr. Wright's report of transit, dated Octobsr 24th, still, the fitness of it escaped me, because, I suppose, it was not there coupled with Leverrier's statsment that a conjunction was due Septsmhsr 21, 1876. It is vsry clear, bowever, that Septsmher 21st to October 24th makes 33 days, and it seems that the *Scientific American* of November 11th (which I nsver got, and there is no oopy of that date either in our State Library or City Library) noticed the 33-day psriod, and, perhaps, the conjunction Levsrrier thought dne September 21st. But at least two years afterward I made notss from *Nature* of October 26, 1876, still without thinking of ths exact fitness of the 33 days to Septemher 21st, there mentioned; so, how apt we are to "sse throngh a glass, darkly," as the Apostle intimated, until all at once, a few days ago, upon re-perusal, and hecause my mind was now upon 33-day psriods, the adaptability seemed to spring upon me almost like inspiration! At the same time I saw well enough that, although 33 days, of course, fittad exactly hstween Septemher 21st and October 24, 1876, I could not accept it litsrally, as, of conrss, Leverrier had rsference to sidersal periods of 33.0225 days, or the real revolution of the planet, not the apparent or synodical revolutions obssrvable from our globe. Leverrier's sidereal period must therefore bave called for ahout 36.30 days synodical periods and required five euch periods from Sept. 21st to March 22, 1877, the date which Leverrier particularly directed attention to, and wae generally observed hy astronomers in honee of finding Vulcan in transit, hut which turned out a failure. The period was spoken of in the newspapers, however, as 33.02 days, and Prof. Davidson having computed and puhlished, Nov. 11, 1876, in the Mining and Scientific Press, possihle *apparent* periode of 21.032 days, the popular inference was that apparent periods of 33.02 days were intended in March; I believe I was so misled myself. But the question of interest to astronomers then was, *why was Leverrier's prediction a failure?* Althongh he attached most weight to the resnlts the computation gave him, perhaps the occurrence of a tranеit, October 24, 1876, as observed by Mr. Wright at San Bernardino, hut unlooked for, aud therefore unnoticed by astronomers generally, may have rendered it impossible for another transit to occur again in March following; or, if poesible then, as the apparent period would he about 36.2825 days, dividing the Lescarhault-Wright interval of 6,422 days by 177, five more periods continued, would make the conjunction or transit to have occurred March 18th, just as the conjunction must have occurred also on September 18th instead of 21st, if we admit the fact of Mr. Wright'e observance October 24, 1876, and can assign an approximate sidereal period of about 33 days at all. The correspondence of 33 days to Septemher 21st and October 24th would have bsen worth pointing out to Leverrier by any who remarked it, and it may have led not only to a recognition of Mr. Wright'e observance generally, with the approval of Leverrier himself, hut led him aleo to modify the 33-day period, eo that it would have reached successful future results. The fact of Mr. Wright'e observance, bas not, perhape, hitherto formed an element in the Vulcanian computations, of any of the professional astronomers. No doubt it eecaped the attention of many altogether; while others could not overcome their scruples against paying any attention to the reports of amateure; yet for argument's sake, and the possibility of eliciting truth, some would be persuaded to consider it, as M. de la Baume is now doing, and I have endeavored to call attention to, it is possihle that it may be found a connecting link with several acknowledged observances, and our computations lead to some future successful re-ohservance.

I am quite aware that coupling Mr. Wright's observance with Lescarbault's is again in conflict with M. de la Baume'e classification, but I cannot ehut my eyes to the close approximation to Leverrier'e acknowledged hest formula, eo that at present I am wedded to no especial classification. My former letter only indicated some obtainahle results from M. Baume's classification, while it eeems to lead to the suppoeition that the time is not ripe for classification yet, excepting simply as an experimental suggestion. And if it is just as much a fact that another transit may he due this year in September or October, as Leverrier intimated, it is quits time to put all the data together and come to the hest determination we can as to the probahle time for the transit, whatever hypothesie may have been offered or we may now deduce. The better way would be, perhape, if space would admit of it, to give all the periods possibly assignahle, and then see what each calls for in October next. But I see I have omitted to give the date that periods of 36.2825 days would give this year, and I am rejoiced to find that it is vastly more favorable than I could have supposed. The interval from October 24, 1876, at 2 P. M., makes 1,814 days 3 hours, so that the transit would he due Octoher 12th, at 5 P. M. Say ingress 12 noon and egress 10 P. M., this date corresponds exactly with the rate of displacement I noticed last week of seven days in three years, or 11.6666 days in five years, ae I etated in the *Alta California* of June 10th, hut forgot to mention in your paper. This concurrence seems so conclusive that I feel that any other tables would he euperfluous, although I have got them in a very forward state for a nnmber of different periods.

A. F. Goddard.

Sacramento, July 5, 1881.

The receipts of bullion in Salt Lake, June 23d, were the largest for any one day this season, aggregating the snug sum of $53,820.

Mine Jumpers.

Among ths evils which sfflict every mining camp, thers is one which is more haneful, hegats more animosities, frequently leading to violence and bloodshed, than any othsr. It is the practices of the "mine jumpsr." He is generally a man who nsver prospects for himself, rarely works a mine when hs gets possession of it, but is constantly on the lookout to take advantage of the enterprise, ssgacity and labor of others. He is of the nature of some classes of birds; too lazy to huild their own nests, but always searching for nests already huilt.

In most cases his opsrations are for purpoees of black-mail solely, hut he has no compunctions of consciencs in robhing a prospector and miner of his property, when hy reason of poverty, sickness, or other misfortunes the asssssment work appears not to have heen amply performed. Even where thousands of dollars have been already expsnded upon a mine he will lie in wait with feline watchfulnsss, hs on the ground at the last midnight moment, to take advantage of any laches, errors or seeming lack of requirement with the law, and pounce upon hie prey, ae does the jackal, which he is, upon a carcass without life enough to reeist. It is well enough to make it known that the policy of the Government, as manifested through its Courts, does not favor these wreckere of mines. One of the ahleet of the United States District Judges of Colorado, in pronouncing a recent decision upon a jumped claim, used the following language, euhetantially: "The law suppoees and takes it for granted that where a man puts $100 worth of work on a claim or location that the mineral was there to justify the expenditure, or else a man would not he foolish enough to put his time or money to such use; and no man has a right to go on the claim of another and break the surface ground of a prospect. In other words, the law accepts the acte of a miner and prospector in good faith, and hie fellow-man ehould do the same and keep his hands off."

Globe district is unfortunately infested by a numbsr of these mine-sharks. It will be fortunate for eome of them, if the real locators and ownere do not teach them a lesson more effective than even the law itself, and much more expeditious in the execution.—*Globe Chronicle.*

Salt Spring Valley.—The Stockton *Independent* says: In Salt Spring valley, and six miles north and east of Milton, Thomas McCarty is re-opening the old Gold Hnnter mine hy sinking on the ledge. As yet he has not reached a depth of over 20 ft. in following the ledge on down, yet he is meeting with most enconraging results. He is preparing to keep the mine free from water, ehould an influx be encountered. He has machinery on the ground for a quartz mill, which he will erect at once to reduce the ore from the mine. The ledge is gold-hearing, of good width, and the quartz is remunerative in quality. Water has heen used from the Salt Spring Valley reservoir till the accumulation has become very low. The Bunker Hill and North Hill mines have consumed a constant flow of 1,200 miner'e inches, and next week the work of clearing up will be commenced, preparatory to raising the dam 15 ft. higher. The telephone is used in this section to a great extent. There are 14 miles of wire running from the mines to the reservoir and to Milton, and even down into the mines.

Ores of the Montana.—As stated in our last, the pack train of Mark-Newcomb is now engaged in carrying the richer ores of the Montana mine on Estes mountain to the works of the Bay Horse Mining and Smelting Co. Hie train passed out last week with 34,000 lbs. of these ores, of the value of $1,000 per ton. The train has returned to the Montana to load with another cargo, of higher grade, which give an average assay of nearly $4,000 per ton. Thsse when mixed with the argentiferous galena of the Bay Horse district, must yield a very high grade of hullion. We look with confidence, to see thie company send out a great mass of base bars, exceeding in richness those of last season, when the average value in the precious metals was over $1,100 psr ton, not regarding that of the contained lead. We learn from Mr. Hoopsr, the superintendent of the Montana, that the result to his company on last yeare shipmente to the Bay Horse works, was more satisfactory than those obtained heretofore either at the reduction works in Salt Lake or Omaha.—*Challis Messenger.*

Mine Accident Suit.—Nellie E. McGinty, widow of the late Captain John B. McGinty, commenced suit in the Superior Court, against the Mono G. M. Co., to recover $40,285 damages, on account of the death of McGinty, who, it is alleged, wae killed while in the employ of defendant, through negligence. The complaint alleges he was caught in a shaft, between a cage and timbers of the mine and eeverely injured, on July 5, 1879, and that he died two daye later from injuries received.

The Hanauer smelter, after a stoppage of a week, during which time a thorough overhauling has been made, has started up again. Under the careful and energetic management of Superintendent Terhune, the Hanauer is doing a large and profitable husiness.

Mechanical Progress.

The Model Machinist.

The genuine universal machinist possesses one quality that is expressed hy the term elasticity. Thia quality helps to fit him to a good many places that he wouldn't fit without it. The elastic machinist don't have his places and his jobs fitted to him. Ho fits himself to them. A good many machine jobs get stretched, because tho man who handles them cannot stretch himself. It don't pay to get the elasticity from the joh. It ought to be furnished by the operator. I wish it could be demonstrated just how much education had to do with the matter of elasticity. I don't particularly refer to the education gained from schools and colleges. I don't object to such education. On the contrary, I appreciate it; hut such an education alone don't make its possessor elastic. It sometimes makes him higoted and inelastic. I mean the education a man gets by keeping abreast of current events and ideas hearing on his profession, hy reading, hy study, and hy observation. It does the machinist a world of good, who has devised certain plans and modes, hy the use of which he has accomplished good results, to find that some one has met with equal success, hy ways and means quite different. If an operative machinist has never turned anything larger than a 20-inch pulley, the quality of elasticity will get him right down to doing a good joh on a 20-foot pulley, without much delay. He won't find himself stretched up to the point instantly; in fact, he won't find himself stretched up to the point at all; hut the quality of the elasticity will permit him to stretch himself there, without danger of breaking in the operation. You can't graduate an elastic machinist from the best shop in the world. He can graduate himself—entitled to a diploma from Sackett's shop, or from Wycoff's—I am not sure; hut he would do it the easiest from Wycoffs; hut he can do it from either. Education won't do it, hut he can't do it without education. He can't he educated up to it, hut he can educate himself up—or down to it. It pays the machinist to possess this quality. That sort of men is always wanted. Jones wants him, Smith wants him, and he is wanted in Maine and California at the same time. He isn't the kind that you wedge into a shop. He is of the kind that make the shop. You wedge in the kind that will fit in only one place. There isn't any particular call for the machinist who only fits one place. There is a sort of standing invitation for him to travel around until he finds an opening of his size, and there is policy for him in filling that opening, till he gets crowded out hy circumstances. Such men doh't control circumstances; they are controlled hy circumstances. A machinist ought to fit himself to control circumstances. It is in every way hetter and more satisfactory than heing controlled.—*F. F. Hemenway.*

How to Work Mild Steel.

The occasional failure of steel plates in boiler and other work, is generally attributed to the want ot sufficient information on the part of the workmeu. To prevent, as far as practicable, the possibility of failure in steel plates, caused hy deficient information as to the proper method of treating this material, the Steel company of Scotland has published and directs the attention of users of steel to the following rules:

(1st) Welding—In welding mild steel plates it is not necessary to heat them to the same high temperature as in the case of iron. Instead of a "welding heat," a bright yellow heat is sufficient; and if flux is required, it need only be three parts clean sand to one part common salt, moistened, and thrown on the parts in the fire. We recommend that the weld he of the V form, in preference to the lap, and that it he treated in the usual way—that is, lightly hammered ou the V part. After the weld is made and while the heat is good, the parts near and on either side of the weld should be lightly hammered. In making the weld, the fuel should he free of sulphur, otherwise red-shortness may result.

(2d) Flanging—In flanging, care should he taken in the local heating that the parts are not overheated, and that no hammering or work is put upon them while at a black heat; further, it would he well if work could he continuous until each flange is completed, or if the plate has to be laid aside before it is finished, it should he protected from chills, if it is not convenient to keep it warm.

(3d) Annealing—After completing either welding or flauging, the whole piece should he heated to a cherry-red heat, and slowly cooled.

(4th) Orders—In ordering steel plates, care should he taken to state the purpose for which they are to be used, especially in cases where they are required to weld and flange.

To Strengthen a Wrench.—As all know, the wooden part of a monkey-wrench handle will sooner or later split off, and turn an otherwise good tool into an unsightly-looking and almost useless piece of old metal. All that needs to be done to prevent splitting is to recess the nut which holds the handle on the body of the wrench. It is suggested that those who manufacture such goods would do well to manufacture them in this manner.

Suggestions to Purchasers of Machinery.

Very annoying and expensive delays are often made neccssary by the carelessness of persons ordering machinery. When such orders are given they should be so plain as to leave no room for doubt. When there is room for doubt, the parties to whom ths order is sent must either send for clearer instructions, or run the risk of sending the wroog article, which must of conse he returned. If the purchaser is in a hurry, this is very annoying, but he has no one hut himself to hlame. We append a few instructions, which will give an idea of the exactness with which orders should he made:

When ordering machinery, specify distinctly the articles wanted, also your full address, town, county and State. Preferred route of shipment should also be plainly designated.

Describe parts of machines wanted for repairs as explicitly as possible, and in all cases where practicable return the old parts or send sketches of same, in order to obviate liability to mistake.

In ordering pulleys, state the diameter, width of face, and exact size of hore wanted, also, whether they should have flat or crowning face.

In ordering gearing, the exact diameter, width of face, number of teeth, and size of hole should he given.

When circular saws are wanted, state whether for ripping or crosscutting, and give diameter, size of hole, gange and style of tooth.

In ordering scroll saws, state the length and width, and whether required for fret or unstrained scroll saw.

In ordering hand saws, specify the length and width, what machine they are for, and whether or not they should he filed, set or brazed.

In ordering anger bits, state the diameter and length of the shank and twist respectively.

Such instructions might he continued throughout the long list of machines and supplies, hut the above are sufficient to give the intelligent manufacturer an idea of what is needed.—*Indianapolis Mechanical Journal.*

Useful Tempers of Steel.

Mr. Henry Seehohm, a well-known Sheffield steel manufacturer, gives the following list of useful tempers for cast steel.

Razor temper (1¼% carhon).—This steel is so easily hurnt hy being overheated that it can only be placed in the hands of a very skillful workman. When properly treated it will do twice the work of ordinary tool steel for turning chilled rolls, etc.

Saw file temper (1⅜% carhon).—This steel requires careful treatment, and, althongh it will stand more fire than the preceding temper, should not he heated above a cherry red.

Tool temper (1½% carhon).—The most useful temper for turning tools, drills and planing-machine tools in the hands of ordinary workmen. It is possihle to weld cast steel of this temper, hut not without care and skill.

Spindle temper (1¾% carhon).—A very useful temper for mill-picks, circular cutters very large turning tools, taps, screwing dies, etc., This temper reqnires considerahle care in welding.

Chisel temper (1% carhon).—An extremely useful temper, combining, as it does, great toughness in the unhardened state, with the capacity of hardening at a low heat. It may also be welded without much difficulty. It is consequently well adapted for tools, where the unhardened part is required to stand the blow of a hammer without snipping, hut where a hard cutting edge is required, such as cold-chisels, etc.

Sett temper (⅞% carhon).—This temper is adapted for tools where the chief punishment is on the unhardened part, such as cold setts, which have to stand the hlows of a very heavy hammer.

Die temper (¾% carhon).—The most suitable temper for tools, where the surface only is required to he hard, and where the capacity to withetand great pressure is of importance, such as stamping or pressing dies, hoiler-cups, etc. Both the last two tempers may he easily welded hy a mechanic accustomed to weld cast-steel.—*Ironmonger.*

Wooden Boilers for Steam.—The almost incredihle feat of making steam hoilers of wood was accomplished 76 years ago in Philadelphia, where they were used to furnish steam to the pumps, for pumping up the river water, for the use of the city water works. They, however, lasted only two years, when it hecame so difficult to keep them steam-tight that they were abandoned for iron hoilere. How was it possible to heat water in wooden hoilers? It was accomplished hy having an iron fire-hox 12 ft. long, 6 ft. wide, and 2 ft. deep, placed inside a rectangular wooden chest, 14 ft. long and 9 ft. square, made of plank nearly half a foot thick, securely holted together hy iron rods passing through the planks. The iron fire-hox had eight vertical flues of one foot in diameter, through which the water circulated and around which the fire acted, and passed upward through an oval flue, first above the fire-hox, carried from the hack of the hoiler to near the front and hack again, when it passed out into the chimney. It was expected that these hoilers would he very economical, on account of the non-conducting property of wood; and so they were to a certain extent, as the hoilers did not need any protecting covering, hnt, as already stated, they did not last, and cast-iron hoilers were substituted and used nntil 1822, when water-power was snhstituted for steam-power in the Fairmount water works.

Scientific Progress.

The Gypsum Test for Milk.

Very little reliahility can be placed on the nsual tests for milk; hut the method given helow, from the *Monthly Magazine*, is said to be quite reliahle, and is certainly very simple:

A method of testing milk hy means of gypsnm has been made known hy Mr. Bertram Ohm; it is so simple, and apparently so reliahle that hy its means many householders will he ahle at once to ascertain whether the milk delivered to them has been adulterated with water or not.

In carrying out this test it is necessary to make use of calcined gypsum, or *plaster of Paris*, in the state in which it is used for modeling; and this can always he procured in good condition in the shops.

One ounce of this plaster of Paris is taken and it is made into a paste with the milk to he tested; the operator takes ont his watch and notes the exact time. He observes how long the mixture takes to become solid.

Milk of the specific gravity 1.030, at the ordinary temperature of 60° Fahr., hecomes solid under these circumstances in the course of 10 hours or thereabouts. If it contains 25% of water it hecomes solid in abont two hours; if it has been adulterated with 50% of water, it solidifies in half an hour; and, finally, if it contains as much as 75% of water, the mixture hecomes hard and sold in 20 minntes.

Milk which has had its cream taken off, and has a specific gravity of 1.033, solidifies nnder the same circnmstrnces in the conrse of ahout four hours; if this creamed milk has had 50% of water added to it, it solidifies in one honr, and with 75% of water, in the course of half an hour.

Mr. Ohm remarks that the time reqnired for solidification, that is, for hecoming hard, is somewhat less if the operation of mixing takes place at a certain degree of heat; hnt perhaps it is safest to operate always at the ordinary temperature of the room. It is useless to add, for analytical chemists, that the solidified product can he afterward, if reqnisite, snhmitted to ordinary analysis—extraction of the hutter hy ether, the lactine, caseine and salts, hy the nsual methods.

Electricity and Wool Spinning.

In spinning dry wool, mohair, and alpaca, of a high class, the process is seriously hampered hy the electricity developed in the fihers hy their friction on one another or on the parts of the machine. The repellant action of each electrified filament on its neighhors canses the yarn to get into a hlowsy or "stickleback" state, which renders it very difficult to manipnlate, and is productive of nnmerous other drawbacks of a serious natnre. The new method of dis-electrifying the wool, described hy Mr. E. Bright to the Society of Telegraph Engineers and Electricians at a recent meeting, is at once a scientific and economical one. It simply consists in putting the hohhins for a short time into an exhansted chamber where the rarified air, which is well known to he a condnctor of electricity, permeates all the pores of the yarn and discharges it. The chamher is of iron, put in metallic connection with the earth, and the hohhins are ranged on a small truck rnnning on rails into its interior. When the air-tight door is closed npon the supply of hohhins, a valve connecting the chamher with the exhaust hulh and air pnmp is opened aud the pump operated. A pressure gauge shows how far the the exhaustion has been carried. From 10 to 30 minutes are required to thoroughly discharge each hohhin, and this is eqnivalent to several months' exposnre to the damp air of a cellar. Carding can also he facilitated hy a modification of Mr. Bright's process, which has already been successfully introdnced with a notahle saving of working expenses, lahor and capital.

Originating New Ideas.—The most difficnlt mental or material operation in the universe is that of originating an entire new idea. Many philosophers deny the possihility. An important thought in the youthful mind, is matnred hy reflections on the more simple meditations and ideas of childhood, and these are, ohviously, hegotton hy what is seen and heard in the still more early dawn of mental receptiveness. First words and ideas, then, are the seeds of germs of thought and they are planted by onr early teachers. This heing conceded our originality can consist only in the new arrangement of words and ideas. To illustrate: We cannot form in our minds even an original animal. We may fancy a living creature with the hody of a horse, the head of a lion, the face of a man, the scales of a fish and the feet of a cangaroo; hnt this would! not he originating anything. It might he a comhination not before dreamed of, hut no proof of genius. So with the working of all powers. We cannot create anythiug. The most original thinkers and workers are those who are ahle to form the most heautiful and useful comhination.

Of Scientific Interest.—Two eggs of the extinct great auk were recently sold hy auction in Edinhnrgh, both heing purchased hy Lord Lilford—one at $500, the other at $510—prohahly the largest sum ever paid for a single egg, with the exception of that of the moa, a single specimen of which was sold at the same place in 1865 for $1,000.

Electrical Paper.

Letter paper, well heated and rubhed hriskly by the hand or a hrush, acquires, as is well knowo, electrical properties. It adheres to walls or other flat surfaces, and even gives, in contact with the hand, small discharges, which are visihle in darkness. The *Revue Industrielle* points out a method of treating paper so that these electrical properties may he increased to such a degree that the sparks shall he of considerahle length. Ordinary Swedish filtering paper is immersed in a mixture of equal volumes of nitric and sulphuric acids, as in the process of making gun cotton. The paper thus pyroxylated is then washed in a large quantity of water, and afterward dried. This paper, when laid upon a piece of oil cloth and rubhed very hriskly, will exhihit very energetic properties, and with it, says the *Revue*, may be perfected nearly all the ordinary experiments in static electricity, such as the production of sparks, shocks, charging of the Leyden jar, etc. Paper makers, as a general rule, know by practical experience that it is not difficult to get electricity into paper; and some of them would he glad to hear of some simple way to get it out. The *Scientific American* recently received a lot of paper that was so charged with electricity that the sheets wonld not separate without tearing, and oould not be run through the press. They were compelled to return the entire consignment to the maker, as its use was impracticahle. The editor of the paper suggests that priuters are more trouhled with electricity, npon their papers and presses nowadays than formerly. Perhaps it is due iu some measnre to the more common practice of running the sheets through the press in a dry condition. On the other hand, may not the rapidly increasing local uses of batteries and electric machines for telegraphs, telephones, lights, etc., yield such a superahundance of the mysterions element as to show itself into the press rooms?

Blonde Hair Changed to Black.—At a meeting of the Biological Society, held at the Smithsonian Institution last evening, Dr. D. W. Prentiss read a paper entitled, "Notes on the Action of *Pelocarpus pennatifolius* in Changing the Color of Human Hair." Prof. Prentiss' paper recorded a very remarkahle case of the change in color of the hair of a lady patient in this city who had heen treated several months for hlood poisoning with jaborandi, a Brazilian plant used in medicine. This medicine, which is given to prodnce sweating in certain rare cases, was first given to the patient in suhcutaneous injections in December last. At that time, and previously, her hair was a light hlonde, hut within about two weeks a change toward a darker color was perceptible, which increased until, in the middle of January, the hair hecame of a chestnut hrown color. In May the color was nearly a pnre black, which it still retains, although there is slightly apparent tendency to return again to a lighter color. As this is the only recorded case of this plant (which is not, however, in common use) having produced any perceptihle change in the color of human hair, it hecomes a matter of interest to know how this change was hrought ahout and how often it might accompany the use of this remedy. A microscopic examination shows the hair to contain a greatly increased quantity of pigment matter, and scientists now await with interest the results of future growths to ascertain whether they will retain their old color or retain that newly acquired.—*Washington Post, June 4th.*

Important Discovery.—It is said that cotton seed oil forms a most satisfactory snhstituto for lard. If so, it will effect quite an important revolution, not only in household economy hut in the profits of cotton culture as well. Col. O. O. Nelson, of Huntsville, Ala., says he has repeatedly used the oil at his house, and finds it equal to the hest article of lard. A hotel-keeper, at Memphis, publishes a statement to the same effect. It has heen tried hy several citizens of Tuscnmbia, Ala., who say they can discover no difference between the oil and the lard. The refined oil is only about one-half the cost of lard. This vegetahle snhstitute for lard cannot meet with any similar objection to that which is encountered hy the oleomargarine manufacturer in his snhstitute for butter. Should this alleged discovery prove a reality, it will effect a most important revolution in two of the leading industries of the country.

Sulphide of Bismuth.—Bismuth in the presence of, or in comhination with sulphur, yields a heautiful red coating when passed hefore the hlow pipe on a large piece of charcoal, upon the addition of a little powdered iodide of potassium. A finely powdered mixture of equal parts of sulphur and iodide of potassium is hest kept for such purpose, and makes an excellent test material for hismuth. In making these investigations, V. Kohell met a green mineral, which occurs associated with joseite at San Jose di Madureira, Brazil, and which proved to he bismuthite.

Population and Altitude.—Dr. Gannet has prepared for the United States census some interesting facts concerning the distribution of population in the United States with respect to altitude. His figures show that one-fifth of the population of the United States live at an altitude less than 100 ft. above sea level; another fifth at less than 500 ft., and nearly one-third below 1,000 ft.; while 97% of the whole population live below 2,000 ft.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

IROQUOIS G. M. Co.—July 11. Location: Tohongo District, Los Angeles county, California. Capital, $10,000,000, in 100,000 shares. Directors—A. Moore, Z. W. Moore, J. Cheny, S. A. Stone and W. S. Lambert.

POLETA G. M. Co.—July 12.—Location: California Capital, $10,000,000. Directors—A. K. P. Harmon, W. E. Dean, W. H. Lent, D. C. Bates and J. H. Boalt.

WESTERN DREDGING AND RECLAMATION Co.—Object: To dredge and reclaim marsh and overflowed lands in this State. Capital, $100,000, in 100 shares. Directors—F. D. Brandon, S. F. Platt, M. W. Bell, F. Warner and J. D. Gray.

TOWER HILL M. Co.—July 13. Location: Nevada. Capital, $10,000,000. Directors—Charles Moss, Wm. H. H. Hart, John C. Beatly, John Ballard and J. C. Fiske.

CARBONATE CON. G. & S. M. Co.—July 13. Location: Arizona, Montana, Utah and Idaho. Capital, $10,000,000. Directors—Wm. Anderson, George R Woods, Wm. G. Woods, L. H. Nichols and W. E. Rothrick.

DURING the month of June, the Manhattan mill reduced 580 tons of ore assaying $133,213.

The Mining Share Market.

Mining stocks are off again, the market being decidedly sick. Assessments to fall delinquent in July amount to $570,900, of which Nevada mines call for $227,500; California, $318,400; Utah, $15,000, and Arizona $10,000. In July, 1880, the delinquent assessments amounted to $961,000. Thus far this year Nevada mines have called for $3,473,460 to keep the hall rolling, of which Storey county wants $2,675,150. During the first seven months of 1881, the assessments have amounted to $5,157,260, against $7,958,500 during the same time in 1880, and $8,714,300 in 1879.

The recently levied assessments (and the expectation of others to follow), though naturally to be expected and universally recognized as a necessity, have apparently caused an alarm among small dealers, which, in a measure, accounts for the very weak state of the stock market. As an additional cause, the reports of the expected and present trouble from water by no means tends to encourage stockholders, and their belief of a month ago that a big "boom" was near at hand has oozed out at their fingers' ends—and the marrow of their financial backbone has apparently gone the same way.

There is certainly, says the Gold Hill *News*, nothing very encouraging from the north end. The crosscuts are run as usual in Sierra Nevada. The water gives some trouble in Union.

The machinery at the C. & C. shaft, through which the Bonanza mines are worked, is in thorough repair, and will stand a long siege of work.

The C. N. S. hydraulic pump will start up for permanent work before the end of the week—which looks encouraging for holders in the middle mines.

The Yellow Jacket is the center of attraction of the Gold Hill group just now. The quartz found by the Sutro tunnel drift is liable to prove interesting.

COMSTOCK prospectors have recently visited the Walker River region, and report finding some very promising veins of gold-bearing quartz. Did the same report come from an almost inaccessible region, there would be an instantaneous rush in that direction, but when it is close at hand the country is not considered worth prospecting. Old prospectors must always encounter hardships and perils before they can be brought to think well of a location. So says the Gold Hill *News*, and there is more truth than poetry in the assertion.

THE Ophir works at Virginia caught fire on the 12th, but very little damage was done.

The Mining Bureau.

Mr. Hanks, the State Mineralogist, has received this week a specimen of Priceite, a very rare and interesting mineral. It is a horate of lime, named after Prof. Price, of this city. The specimen came from Curry county, Oregon, which is the only place in the world whore it occurs, except, we believe, one locality in Nova Scotja.

The Mining Bureau has also received from the southern part of this State a specimen of cnproscheelite, which is another very rare mineral.

Among other things received by the Bureau lately is a curious piece of pig iron from Oregon. It is in the shape of a little pig or shoat, and is from the first castings of Oregon iron. The Bureau has now a piece of the first har ever cast in Oregon, and also the first har ever cast in this State.

The Bureau is now in its new quarters on Sutter street, but work on the building is going on so that the collection is not in a condition to be examined. Mr. Hanks has his office in one of the front rooms, but the large room where the collection will be displayed is not finished. The Bureau will have its own private entrance, and the rooms will be conveniently arranged for musenm, office, lihrary, lahoratory, store-room, etc.

The collection is being constantly added to, and before long will he the finest in the country. Mr. Hanks is indefatigable in his search for rare and valuable specimens, and continues to secure large numhers for the State.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Algonqnin (Montana), July 3d, $5,500; 7th, $7,000; Buffalo (Idaho), 10th, $3,000; War Eagle (Idaho), 10th, $17,128; Silver King (Arizona), 7th, $24,043; Sunpatic, 6th, $4,730.83; Western, 5th, $11,020.09; Sierra Nevada, 6th, $27,558.04; Standard Con., 3d, $18,358.76; Northern Belle, $5 549.25; 9th, $8,278.33; Navsjo, 12th, $5.500; Mt. Diahlo, 8th, $6,938.73; Christy, 5th, $4,379; Germania, 5th, $2,300; Hanauer, 5th, $1,700; Horn Silver, 5th, $10,000; Ontario, 5th, $4,324; Ontario, 2d, $5,358; 3d, $5,434; 4th, $8,808; 6th, $9,607; Mammoth, 3d, $3,000; Germania, 6th, $2,320; Mayflower, 6th, $5,150; Hanauer, 6th, $1,720; Bullion, 6th, $8,850; Pasco, 6th, $1,300; Ontario, 7th, $11,940; Hanauer, 7th, $1,750; Christy, 7th, $1,170; Ontario, 9th, $10,780; Pascoe, 9th, $1,360; Hanauer, 9th, $1,720; Mayflower, 9th, $4,280; Bullion, 9th, $4,240; Head Center, 10th, $5,090; Mt. Diahlo, 7th, $6,938.73; Northern Belle, 11th, $7,100; Eureka Con., 7th, $7,643.34.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

CALAVERAS.

NEW GIANT.—Calaveras *Chronicle*, July 9: The Calaveras W. and M. Co. have had built for them one of Hoskins Bros.' latest improved giants (top roller instead of bottom), 9-inch butt, capable of throwing 1,000 inches of water. They have it in operation on their North Hill claim, and it is doing big work. They expect to have 3 more of these at work on their claim the coming season.

GLENCOE DISTRICT.—The Mexican is an ancient locatiou. Mexicans were the original owners. The ore they taken from the vein was from 6 inches to 2½ ft in width, producing from $60 to $115 per ton. Several years ago the present owners purchased the mine, and developed it since then with profitable results. Four different ore chimneys have been exposed with but little dead grouud (supposed to be) intervening, covering a linear distauce of some 1,100 ft. Three of the chimneys have been exhausted to water level, the deepest shaft being 115 ft. All the lower levels denoted an improvement in quantity and quality of the ore. The entire extent of the ore body now being opened has not been ascertained, but is 80 ft in length so far.

VANDERBILT MOUNTAIN.—*Echo*: The proprietors of the Vanderbilt mine have sunk a new shaft 75 ft deep, and are now drifting south toward the old shaft. They expect to strike the main ore body in about 18 ft. The vein is over 5 ft wide and prospects well. As work progresses on the Confidence mine, the vein widens and the ore increases in richness. We were showu several large pieces of ore taken out a few days since at a depth of not more than 45 ft, which we are quite sure will pay from $500 to $800 per ton.

EL DORADO.

RICH STRIKE IN THE ROSE MINE.—*Mountain Democrat*, July 8: The Rose Quartz G. M. Co. have been running a crosscut on the 140 level, from the main hoisting shaft west, to cut a body of ore that prospected well ou the surface. This week they reached what is supposed to be the foot-wall, at a distauce of 80 ft from the shaft. Before reaching the foot-wall they passed through a vein of ore that prospected well in five gold and is fully 6 ft wide. So far as can be determined by the appearance of the vein as it lies against the foot-wall, it is reasonably safe to assume that the recent development will place the Rose mine on a substantial hasis for further operations.

THE Grand Victory mine has changed hands, having been sold by the former owuers at a fair advance on their investment. The new company will commence operations on Monday uext.

MINE SALES.—El Dorado *Republican*, July 7: We hear of several transfers of mining property during the week, though we are not possessed of sufficient facts, in most cases, to more than announce sales. Large money is named in connection with some of the transactions. The Kimball comes first. It has been sold conditionally, so much money to be paid in a specified time, or money advanced to be forfeited. Mine stands idle in interim. Senator Jones is named in connection with the transaction. The price to be paid we do not get definitely, but know that less than $80,000 would not make sufficient impression to cause operations to cease even for a fortnight. The Mt. Pleasant has again beeu sold to parties who intend to push development with a view to making the most out of it in the shortest possible time. We do not hear the purchase price definitely named, but half a million is so often and promiscuously mentioned in connection with the last deal, that we conclude that that must be about the price for which the mine sold, and we believe that 10 months square work, with a 20-stamp mill, would pay that amount, were the mine worked to the best advantago. The Stillwagon mine, Cosumnes township, a mine scarcely developed, but one which has paid largely for the amount ot work done upou it, has been purchased by Sam Laue, a practical miuer, and he proposes to open it out in good shape at once. The siuking of a 200-ft shaft will be the first work inaugurated. The Meltons, we learn, have disposed of one of their mines, near Grizzly flat, and that machinery is to be put upon it directly. The air is full of rumors of sales of mining property, but as we are unable to get the facts authentically, forbear making further mention.

SR. LAWRENCE.—Georgetown *Gazette*, July 8: The works on the St. Lawrence mine, Kelsey district, were burned last Wednesday. The mine belongs to Messrs Mierson & Alderson, of Placerville, and has been idle for some time. The loss willl amount to a few thousand dollars.

ITEMS.—From A. W. Martin, who was in town to-day, we gathered the following concerning some of the Greenwood mines: The famous Cedarhurg, owned by E. W. Hulford, is expected to be started up some time this fall. The North Extension, owued by Dr. Martin & Co., has been prospected this summer quite extensively by drifts and shafts, showing a number of good seams, which will he worked by drifting after some hydraulicking is done, which last work they are preparing to enter upon this fall. North of this mine is another extensiou of the Cedarburg, owned by Morrell & Peterson, who are doing some extensive drifting, and also expect to begin piping when the rainy season sets in. We learn that the hoisting and pumping works of the Cashier mine, Jas. Morgan, Supt., at Georgia Slide, came near being destroyed by fire one day this week. The awning took fire from the friction of the wheel. Work at crosscutting from the shaft to the ledge on the third level of the Eureka is going ahead nicely. Supt. Check thinks the ledge will be reached by July 20th. Ballard & Hotchkiss have commenced running a tunnel to tap their ledge adjoining Smeder & Forni's claim on the south, near the big flumes of the Cal. W. & M. Co., east of town.

INYO.

TO BE ABANDONED.—Inyo *Independent*, July 9: The Resting Spring mines, located in the southeastern corner of this county, are to be abandoned. A few days since some of the owuers of those mines were sent out from Los Angeles with instructions to clean up the amalgam to date, sell the mill, discharge the men and abandon work.

AT DEEP SPRINGS.—Jas. E., the junior of this paper, accompanied Messrs. Griswold & Todd on their tour of inspection of the mining properties and chances over at Deep Springs, starting Sunday last. Mr. Hedge came in last Thursday, and reports the party well pleased with the outlook in general, but intending to remain several days yet so as to see it all as near as may he before returning.

THE KEARSARGE.—Recent developments in the deepest workings (some 600 ft under ground) of the Kearsarge are of such an encouraging character as to warrant us in saying that active work will, ere long, be inaugurated on the deep or "big" tunnel, by which alone can the real value of the famous old mine be satisfactorily determined.

BULLION SHIPMENT.—June 29th, the O. L. M. & M. Co. shipped one bar of bullion, weighing 62½ lbs, valued at $1,300. The mill at Keeler is now shut down and hands discharged, but it is not the intention to permit this state of affairs to continue hut a few weeks at most. The mill is, we believe, one of the very best in the State, and, up to date, has made a splendid and paying record, with J. H. Holt in direct charge, and Capt. Keeler for general manager.

MARIPOSA.

HORNITOS MINES.—Mariposa *Gazette*, July 9: At the No. Nine mine quite a number of miuers are employed, and rock in quantities is being brought to the surface. The mill, which at present is idle, will start up as soon as pipe is laid, which is to conduct water from Bear creek, a source which will afford ample supply for the purposes of the mill the whole year. This property is now owned by a Mr. Huling. Frank Thorn is made the Supt., who, with other native practical assistants will, without doubt, soon

be able to reclaim for the No. Nine its more brilliant laurels, which under a late management have become slightly clouded.

ENTERPRISE MINE.—This mine, which is principally owned by R. W. Barcroft, of Hornitos, has resumed work, placing upon the dump quantities of pay ore.

WASHINGTON MINE.—At this mine an air compressor is being constructed and machinery for the purpose of driving a Burleigh drill a sufficient distance into the bowels of the earth, to expose a large body of rich ore said to exist below the 1,400 level. The great depth of this mine ought to be a sufficient guarantee to other owners of mines in the same neighborhood to sink down upon their mines as far as indications of pay ore extend.

MONO.

BODIE.—*Free Press*, July 12: The most cheerful piece of news which has been heard in Bodie for some time, is the fact that the new pump column at the Red Cloud shaft is now in position and that pumping has been resumed. Shortly work will again be in progress in the bottom and in the crosscut started at the 600-ft level for the Concordia. We would not be surprised, from a pretty familiar knowledge of the Red Cloud ground in the 250 and 400 levels, to learn of a development in the territory of that company as well as in that of the Concordia. The ore is said to be showing up splendidly on the 520 level—in fact the mine is now looking finer than at any previous time in its history. The Addenda also is exposing some very rich ore. Work on the proposed new mill for the Bodie Tunnel and Mining Co. will at once be commenced. James M. Dawley, formerly of the Standard, having arrived to take charge of it. A Howland pulverizer will be used, of a capacity equal to that of 20 stamps. The Bechtel is running steadily and satisfactorily the 40 stamps of the Noondays. About 85 tons per day are run through. The Lent shaft is getting down toward a point where it will be interesting.

NEVADA.

CENTENNIAL MINE.—Grass Valley *Union*, July 11: A recent crushing of 22 loads of rock from the north drift of the 400 level of the Centennial mine paid $40 per load, not including sulphurets. This is a better result than was anticipated, as the good rock on that level has heretofore come from the south drift.

RICH SPECIMEN ROCK.—The Ford & Mullen claim, on New York hill, continues to turn out the rich specimen rock for which the mine has been noted for several years past, an evidence that the rich chute in the vein is by no means exhausted. The rock is so rich that it is gathered up in boxes and stored away so that it can be run through the mill at a stated time. There is now in the vault at Judd's store, Boston ravine, 27 boxes of this rock, amounting to about one ton in weight, the value of which it is difficult to guess at, but estimates run all the way from $12,000 to $15,000. Many of the pieces contained in the boxes have bands of almost solid gold running through them, some of the bands being between one and two inches in width. The gold is heavy, and of a quality that will count up rapidly in value. There are also a few specimens that show leaf gold projecting from the quartz. These are very handsome, but of course not so valuable as the solid granular looking specimens. The "rich streak" in the mine has continued to produce this remarkable ore, off and on, for several years, until miners have come to call the Ford & Mullen "the greatest little gold mine in America," as in every little while it turns out these bonanzas, to the surprise of the owners and the public.

SAN DIEGO.

PINACATE MINES.—San Diego *News*, July 8: The Pinacate mines are located in the northern part of the county, in the region of the county known as the San Jacinto, distant from San Diego say 75 miles. The district seems to be developing into rich mines, and recent discoveries there outside of the mines already being worked, indicate that there are yet finds in the district. We have examined some rich ore from that district, and from the Lucky Cuss mine, belonging to Messrs. Pancho Estudillo and a gentleman by the name of Waters, now in this city, that looks very rich indeed. There is one large piece of quartz, weighing perhaps 5 lbs., glistening with the precious particles, and several small pieces that are much richer, apparently. We believe the owners have a good thing in the Lucky Cuss, and that others will do as well.

SHASTA.

DEADWOOD ITEMS.—Cor. Shasta *Courier*, July 9: Greavis & Lambreth, owners of the Black Bear mine at this place, are erecting a 10-stamp mill. A good road has recently been finished from Lewiston to this and also the Frick & Davis mine. Frick & Davis are working in good rock, their ledge, though narrow, is paying well. The Gibson Bros.' mine is improving as they go down. The main shaft is down a distance of 40 ft, and the ledge at this depth gives every indication of permanency. The McDonald Bros. recently discovered a ledge about 8 inches thick. It is reported as very rich in free gold. Work on Shafter's mine is being vigorously prosecuted and is paying well.

SIERRA.

GOOD MINE.—*Mountain Messenger*, July 9: From all appearances the Black Jack mine, in Jim Crow canyon, is destined to be a first-class property. From a crushing made there a yield of over $15 per ton was had, and the sulphurets saved yielded as much more. Should the ledge continue to widen as it goes down, of which there is every indication, it will soon be upon a paying basis, and take a prominent place among quartz mines.

MINERS' UNION.—A Minors' Union has been organized at Forest city, with a large number of names upon its roll. Just what the especial object of this Union is we have no means of knowing, as it is reported to have no connection with any other Union, but is a law unto itself, being a secret organization. We suppose its object is to establish the price at which miners may work. We understand that no one is allowed to know its objects until he joins the organization.

NEW SHAFT.—The new shaft at the Bunker Hill claim, beyond Saddle Back, has been completed, and gravel will be taken out in a few days. M. McFarland, one of the owners, carried over 100 ozs. of gold to Downieville two months ago. Bad air has stopped work to the present time. This has been a trouble for years. A tunnel of main tunnel, 2,000 ft; depth of shaft, 240 ft. Twelve men are employed. The original stockholders are working the claim and doing well.

TRINITY.

A NICE NUGGET.—Trinity *Journal*, July 9: Mr. J. R. Flagg, foreman in the Ward mine on Gregon gulch mountain, this week showed us a piece of solid gold weighing $65.75, which was picked up in the mine the other day, and being the largest ever found there.

TUOLUMNE.

A GIGANTIC MINING ENTERPRISE.—Cor. Tuolumne *Independent*, July 9: There is in contemplation a mining project which will, if carried out, eclipse any mining enterprise of the kind in the past history of the county. It is proposed to mine out the bed of the main Stanislaus river from the junction of the south fork, a distance of ½ mile below. Also, the south fork from its junction with the main, a distance of ½ of a mile or more, will be mined. To effect the object a large flume will be constructed, ¾ of a mile in length, with a capacity sufficient to carry the waters of both streams—or, in other words, what they ford in the summer season; then, by throwing a dam across the streams, the water will be turned into the flume, thereby draining the bed of the river where it is proposed to mine it out. Parties representing capital have been down to the river, at the points named, and made a thorough examination of the locality, and think favorably of engaging in the undertaking. There will evidently be large bodies of immense rich auriferous sands and gravel found in the river-bed after the waters are turned out. It is to be hoped the enterprise will be carried out, and, in the end, prove a financial success. We are quite familiar with this locality, and have some little knowledge of the richness of the gulches that discharge into it, and the slopes along the river at either side, which were worked in early days, and were made available at trifling outlay. After a careful consideration of all the advantages and disadvantages, we see no reason why it cannot, if the operation is properly conducted, be made profitable to the investors.

NEVADA.

WASHOE DISTRICT.

ALTA.—*Enterprise*, July 9: During the greater part of last week we have been engaged in putting in pumps. The 1850 pump will be started up to-night. Depth at shaft, 2 116 f'.

SIERRA NEVADA.—On the 2500 level the joint east winze has been sunk and timbered 6 ft. Crosscut No. 1 has been advanced 30 ft, and No. 2 was extended 20 ft. On the 1900 level a large force is engaged in removing air pipe to the surface. During the week have raised 100 tons of ore.

UNION CO.—On the 2500 level the joint Sierra Nevada winze has been sunk and timbered 6 ft.

OPHIR.—On the 2500 level the joint Mexican east winze has been sunk and timbered 7 ft.

UTAH.—The incline has been sunk and timbered 15 ft. The ground in the bottom is somewhat harder. The north drift on the 400 level has been extended 50 ft.

UNION SHAFT.—Are cutting out station and pump foundation at the 2700 level, and casing timbers on the 1900, 2200, 2400 and 2500 stations, and repairing the surface machinery.

MEXICAN.—On the 2500 level the joint Ophir east winze has been sunk and timbered 7 ft.

YELLOW JACKET.—East drift, 3000 level, has been advanced 51 ft during the past week, making the present length of same 116 ft from the shaft. Ground continues dry and hard. On the 2800 level, are still employed cutting out for a chute on west side of winze. The water in mine continues same as last report. About 50 ft north of our south line the Sutro tunnel has cut quartz with a strike east of north and south of west with a dip to the northwest, which gives low assays, evidently a feeder to our ledge.

NEW WELLS-FARGO.—All the water is now out of the shaft and drifts of the lower level. The shaft has been repaired and is now in good working condition. The sump has also been cleaned out to a depth of 15 ft. which gives sufficient space for holding water from 7 to 8 hours without hailing, thus leaving us in a good condition to go on and develop the mine. After draining the water from the drifts, we find that they are badly caved from the action of the water, the flow of which has now diminished from 100,000 gallons per 24 hours to 7,000 gallons per 24 hours. After making a thorough examination of the formation we are led to believe that the dip of the vein is to the west, which is characteristic of all the surface bodies found on the Comstock at this depth. We are now starting a drift to the west, from the bottom of the shaft, in a very encouraging looking formation.

GOULD & CURRY AND BEST & BELCHER SHAFT.—The shaft has been sunk and timbered 20 ft; total depth, 2,055 ft.

CON. IMPERIAL.—We are pushing operations vigorously on the 2,000, 2,600 and 2,800 levels, the latter level having cooled off sufficiently the past week to allow of men working at that point.

CALEDONIA.—Our pumps have been run an average of 9¾ hours per day, consuming 4 3-7 cords of wood per day.

OVERMAN.—We have extended the drift on the 2,275 level 40 ft, and put in 6 sets of timbers in the east drift. The ground in the face of the drift requires close timbering.

SUTRO TUNNEL.—Additional to the usual repairing along the main line, a shift of men has been employed most of the week cutting extra sills under the track near the 17,100 point; also, some ground has been retimbered at point 3,100 ft. The face of the south header is now 15.77 from the north line of the Kentuck claim. Nature of ground in the face, hard; character of rock in the face, andesite; number of ft last report, 4,023; driven since, 65; total, 4,088 ft. The flow of water from the tunnel for 24 hours is equal to 4,769,280 gallons.

BALD MOUNTAIN DISTRICT.

COPPER GRE.—Eureka *Sentinel*, July 11: Bald mountain, White Pine county, is rich in both silver and copper ores. There has never been any large amount of capital expended in the development of the mines of that section. From all accounts there is no better field anywhere for the profitable employment of capital. Copper mines are ready sale in the East at good figures. If the Bald mountain mines are as good as represented, it ought not to be a difficult task to enlist purchasers for them. Some of the specimens left with the *Sentinel* will be expressed to parties who operate copper mines, with a view to getting them sufficiently interested to come out and take a look at the Bald Mountain section.

ESMERALDA DISTRICT.

PROGRESS AND DOINGS.—Esmeralda *Herald*, July 9: In a quiet way things are assuming a better look for the future than outward appearances would seem to indicate. Eastern men have for some time been investing in mines here, without making the usual parade of their purchases that is customary with capitalists on this coast. There are now 3 or 4 Eastern companies who own mines in this district. The Cortez is one of the mines owned by New York men, and the development of this property is flattering indeed, and highly satisfactory to them, as it is proving to be one of the finest pieces of mining property in Nevada. The Seminole is also owned by parties in New York, whose intention it is to shortly commence operations, two of the interested parties having thoroughly examined the property during the past week, and were highly pleased with it. A portion of the Humboldt West will shortly change hands at round figures. This mine is opening up handsomely, every stroke of the pick showing the finest kind of ore. The Silver Lioing gives flattering results for the amount of work done. The Rothchild has a fine ledge from which $50 ore is being extracted. The Centennial, as work progresses, still holds its reputation as a fine bullion producer. In fact, wherever work has been done in the camp the most gratifying results have followed.

THE HUMBOLDT WEST.—The south drift on the east wall has been advanced during the week 14 ft. The ledge continues to show the uniformity in value. The mine is certainly developing well, and has now not less than 75,000 tons of good milling ore uncovered.

SILVER LINING.—Some ore has been taken from this ledge during the week, only a few ft below the surface, that assayed in gold $120 and $14 in silver, making the total value per ton $134.

THE ROTHCHILD.—The west drift on the 50 level is now in 30 ft on the ledge. The average quality of ore taken out in running the drift is $50 per ton.

CORTEZ.—We visited this now, beyond a doubt, wonderful mine last Wednesday and were surprised to see the amount of ore on the dump that had been extracted in sinking and drifting on the ledge, to say nothing of 2,000 or 3,000 tons of the same kind of ore that has been developed by the drifts and the incline. There are two ore dumps, one for the first and one for the second-grade ore. Of the first grade there is over 200 tons, while the other dump is variously estimated to contain 80 to 100 tons. A very rich strike was made in the west drift this week. The rock is literally covered with gold, which can be plainly seen with the naked eye.

GRANTSVILLE DISTRICT.

THE ALEXANDER.—*Bonanza*, July 9: The portions of the mine now being worked on present a marked improvement during the week ending this date. The ore body in north end of No. 5 is producing about 25 tons per day, which is improving in quality as the body is being opened up. This body is now developed in length over 600 ft, and the ore is fully 50 ft in width where we are working in No. 5. The raise started on west side of incline to connect with No. 5 ore body is up 30 ft from No. 0, in ore all the way.

THE BROOKLYN.—In the Brooklyn the crosscut south from No. 3 level is showing some very rich bunches of antimonial silver. The stopes on Nos. 1 and 2 levels are producing their usual amount of ore.

THE ALEXANDER MILL.—The mill is running along nicely and working the company's ores to over 80% of their assay value.

REBEL CREEK DISTRICT.

THE ROCK CREEK MINES.—*Silver State*, July 9: Last week an item appeared in the *Silver State* relative to the Rock creek mines, discovered recently by the French boys. Since then we have received a note from the owners, Sarach, Wells & Co., who say they have named the 2 ledges discovered by them the French Flag and Silver Hill Con. They say they have had an average of the main ore streak, which is 4 ft wide, assayed, with the following results: No. 1, red ore—silver per ton, $67 54. No. 2, reddish ore—silver per ton, $31.42. No. 3, iron ore—silver per ton, $26.70. One assay of ore from the hanging wall yielded $131.35 in silver per ton. The ledge is 22½ ft wide. A drift has been run on the lead a distance of 90 ft, and two crosscuts show the vein to be 22½ ft wide, as stated. The mines are situated in Rebel Creek district, about 10 miles south of Willow Creek station, and 40 miles north of Winnemucca.

ARIZONA.

THE MONARCH OF THE SEA.—Pinal *Drill*, July 9: The location of this mine is 150 ft northeast of the famous Silver King, and adjoining the Northern King. It has 2 tunnels, one 35 ft and one 45 ft into the hill, both on the ledge. The vein is from 2 to 4 ft wide, in syenite and granite formation, and carries carbonate, chloride, black sulphurets, galena, white quartz, brittle and native silver, and assays from $50 to $3,000. Some of the ore was shipped to San Francisco and produced from $800 to $900 in bullion per ton, and there has been a test mill run at the Miami mill at Globe of about 5 tons, which netted $500 per ton.

PINAL CON. M. CO.—The property of this company consists of the Silver Bell quartz and the Columbia mines. The company is organized in San Francisco. The trustees and purchasers of the mines are Messrs. Henry Donnelly, ex-superintendent of the Eureka Con., Henry Linkton, F. Locan, S. Hart & H. H. Noble. These gentlemen are all capitalists and mining men. They have surveyed and located a wagon road from the mines to the Gila river, a distance of about 9 miles. An excellent road can be made for about $10,000 to the mill site on the Gila. Work on this road will begin about the 1st to the 15th of August, and the development of the mines will then commence, and, as soon as sufficiently opened, smelters will be erected on the Gila river, where there is an abundant supply of willow and cottonwood, which is the best kind of timber for smelting purposes. The capacity of the furnace will be 50 tons. The company will also buy silver ores from the surrounding mines.

THE KING MINE.—There is 6,000 to 8,000 tons of ore on the dumps, as much as they can work in half a year, and the ore in the mine lays there in masses ready to hoist up. The mill is running full force. We went through the mine on Wednesday last, they are now about 100 ft below the lowest level.

GOLD.—Tucson *Journal*, July 10: We had the pleasure of a friendly visit yesterday from Mr. Wm. C. Grosso, a young gentleman formerly of Oakland, Cal., but now and for some time past a resident of Phenix, in this Territory. He exhibited some beautiful specimens of fine gold, taken from the Burchett and Benbrook mines by him. A clean-up of 25 tons of ore last month gave about $2,500 in fine gold. The property is opened by shaft about 90 ft; the ledge is narrow but very rich. This mine is located in the Tonto Basin country, and is the property of Burchett, Benbrook, Robbins & Grosso. Mr. G. informs us that some 20 arastras are being worked there, and considerable gold being taken out. This is the best gold mining section of Arizona. This section of the Pioneer district is exclusively gold bearing.

CABABI DISTRICT.—Arizona *Journal*, July 5: Mr. David Armstrong, a pioneer prospector and manager of a company composed of St. Louis capitalists, returned yesterday from Cababi district, where he has 35 men employed on the Dominion, Gohir and Third Term mines. From him we learn the following: There is a combination shaft being put down on the Dominion and Ophir, which has reached a depth of 100 ft. At the bottom of the shaft the vein is 9 ft wide, well defined walls. Seven ft of this vein is ore, which will average $90 per ton. There is now 200 tons of ore on the dump. Night and day shifts are being run also, on the Third Term Mine shaft, which is now down 100 ft. The bottom shows a 4 ft vein, between well defined walls. Water has been encountered in considerable quantity. Mr. Armstrong says the Papago Indians came from far and near to get the water, the supply being greater than at any point in that section. These mines are situated in Pima county, 65 miles from Tucson, in what is known as the Papago country. The elevation is 6,400 ft above the level of the sea. These mines were located by Mr. Armstrong two and a half years ago, and have been worked by him up to six weeks ago, in conjunction with H. B. Jenks, when James Edwards and D. S. Foster, of St. Louis, became interested.

COLORADO.

GENEVA DISTRICT.—Georgetown *Courier*, July 7: Since the failure of the Geneva Con. Co. last spring, mining matters have been more quiet than usual in Geneva district, but since the snow disappeared more life has been shown. J. B. Cleveland is developing the Girard and Grand Trunk lodes by sinking on the latter and running a tunnel for the former. He is also running a large tunnel for the Treasure Vault lode, which will be 3,000 ft long when that lode is reached. The Treasure Vault and its extension, the Olen Dale, is one of the largest lodes in the district. The A. B. Sill lode, owned by Capt. McGuire, Capt. Hinkle and Harry Warren, carries a galena ore vein 3 ft wide, not wholly solid, which gives mill-runs of 800 ounces of silver to the ton. The Mary Ann, owned by Thos. W. Jones, of this place, is opened by a crosscut tunnel from which a drift 60 ft long has been driven on the lode. This drift shows a continuous vein of galena ore 18 inches wide. Considerable prospecting is going on. Two nice looking lodes have lately been struck near the Mary Ann, by Berry & Sullivan. Both carry good ore veins, one being bismuth and the other lead.

ATLANTIC DISTRICT.—There are quite a number of prospectors at work in Atlantic district, and many new strikes have lately been made that give promise of becoming valuable mines. The Harder Bros., on Stanley mountain, have sunk a shaft to a depth of 90 ft, which shows a 3-ft crevice and a 5-inch vein of excellent ore. The Homestake, on the same mountain, owned by Shepard & Arnold, shows a 10-ft crevice that carries an ore vein from 12 to 15 inches thick, from which mill-runs of over 300 ounces of silver to the ton have been obtained. A short distance below the Pleasant Hill is the Banker, a parallel lode owned by H. M. Cline & Co., which has been opened at 3 places about 100 ft apart. The crevice is 10 to 12 ft wide, and carries a large quantity of scattered ore and silver glance, a sample assay of the quartz running 276 ounces.

IDAHO.

SQUAW CREEK.—Yankee Fork *Herald*, July 7: A large smelter has been purchased for the mines under the supervision of J. D. Murphy. It will be running early in the fall, and, as the ores in that district are plentiful and rich, another town of considerable importance will spring up on the Salmon. Already two town sites have been located—one 2 miles above the mouth of the creek and the other at the mouth.

THE OEN. MILES AND SILVER BELL.—Geo. Morton is getting everything in readiness for the work on the tunnel of the above-named locations. A smith shop is nearly completed, and other improvements will be added for the comfort and convenience of the workmen. The tunnel is already in a distance of 100 ft, and at that point a ledge of black and brown quartz appears, but the width is as yet unknown. The principal vein lies about 75 ft farther up the hill. The outcrop is all of 125 ft in width, and from 10 to 25 ft in bight, of solid ore, that assays from $40 to $50 per ton. These mines are on the south slope of Mt. Custer and immediately below the celebrated Sunmit.

YANKEE FORK MINE.—*Herald*, July 7: Last Sunday we paid a visit to the placer claims of the above-named company, on the Salmon, where we found the giant at work tearing down the large bed of gravel. The waters of the Yankee Fork afford an abundant supply for hydraulic works on the most extensive scale, there being 10,000 inches available for the purpose. There is about 1,000 acres of ground on the high gravel bars between the mouth of the Yankee Fork and Thompson's creek, 12 miles below, which is owned by the company. The average depth of the gravel is about 60 ft, which prospects from the bedrock to the surface. It is unusually free from cement or clay, and the average yield is 25 cents per cubic yard, which is high for hydraulic ground. The little giant now in operation is moving and washing 2,000 cubic yards of gravel per day of 24 hours at a total cost of $30, or 1½ cents per cubic yard. Two and one-half miles below the present workings the company owns a very large and fine bar, known commonly as Marsball Crawford's bar. The ground of the bar will average fully 50 cents per cubic yard, to which point the company's superintendent expects to extend the works this season—doubling the capacity by adding a little giant of like capacity with the present one. All these bars have been mined more or less for years after the old-fashioned manner; that is, by shoveling in or drifting, and washing the gravel with a few inches of water during the first weeks of spring, realizing in this way many thousands of dollars in dust. With the improved appliances and larger operations of organized capital under the present company, it seems as if the question of successful and profitable placer mining in Idaho is as good as assured.

WOOD RIVER ITEMS.—*News*, July 9: Pete Chandler, a nephew of the late Zach, is preparing for his mill, which is now between Little Wood river and Bellevue. In fact, 33,000 lbs of it were on freight teams at Little Wood river on Wednesday last. Mr. Chandler represents a strong company and the Scorpion group of mines. The mill will be put up about 4 miles due west of Bellevue. Scorpion gulch heads but a short distance west of Broadford, and empties into Croy's creek at the upper end of Croy's old ranch.

GREENHORN.—Tom Boyce, Ed. Cowell, Dan Doud and John Neil are still delving away with good cheer in the Occidental. The location of this mine is good for cheap working, and if it continues to develop as satisfactorily as present indications promise, it will rank among our best before fall. Its location is upon a feeder of Greenhorn creek, about 2 miles from the toll bridge on Wood River.

ITEMS.—It is only about 55 ft from the Occidental to the Vienna incline, which is also on the same ledge, but, this property now being bonded, is lying idle to await the result of time—"sale or no sale." Almost in a due southerly direction from the Vienna is the Silver Reef, Harry Harley owner. On this property not to exceed $10 worth of work has been done, and still there are 20 or 25 tons of 40-ounce ore on the dump. Many claim that the croppings of the Occidental curve slightly, and upon this theory the Imperial has been worked, disclosing in a 30-ft shaft 2½ ft of 83-ounce ore. Workmen are driving ahead both tunnel and drifting work on the Green Veil. This is an excellent property—a full 3-ft vein streaked through and through with galena, iron-stained quartz and carbonate ore. On the north side of Greenhorn is J. B. Ritchie's Clipper, and 2 men are working in the mine. Miners are also employed in the Lucky Boy and Oreenhorn mines, but the Maud May, an excellent property, is now idle.

LOOKOUT MOUNTAIN.—Wood River *News*, July 9: We are informed that capitalists have been looking over Lookout mountain who will do something in the way of opening up our nearest mines. They have been attracted by the richness of assays which characterize the ore in that locality. Of course Miller, Lusk & Co. have a good mine in the Monday and in the Queen Victoria, and, outside of these two, there has been no development attempted. John Walker is a director in a new company of Boston and Philadelphia men, who have come together as the owners of 7 good locations lying adjoining and between the Monday and Queen Victoria. They were opened up last winter in a superficial manner, but as best the boys could do. Mr. Walker says that when work is once started on these properties it will be pushed vigorously to develop their hidden wealth. The claims consist of those known as the Walker mine, Bellevue No 1, Sadie and an extension thereto, Deadshot, Chicago and Hagerman. The company is to do business under the name of Bellevue Con. M. Co.

SOUTH MOUNTAIN.—Gwyhee *Avalanche*, July 9: The work of the Varkuff Co., at South mountain is progressing most favorably with the best indications. A large amount of fine smelting ore is being taken out that will go 100 ounces or more to the ton. Furnaces are being put in order and concentrators will be put in for working the low grade ores that will not smelt. The company are in need of more men, and 20 good miners can find steady employment at $4 per day. Those who have had experience in base smelting ores are prefered. It is the intention of the company, as expressed by their agents here, to conduct their operations on a business basis. To pay cash for everything they get, have a pay day each month and pay on that day regardless of what the product of the mines may be. They have ample faith in the worth of their property and are determined to make the mines pay on their merits alone.

OREGON.

SUTTON CREEK.—Bedrock *Democrat*, July 7: On Sutton creek all parties at work seem well satisfied with the result of their labors. We understand that the mines owned by Crouter & Co. are paying far in excess of the most sanguine expectations of the owners. They have no hydraulic, but with a ground sluice they take out $2 per hour, and have plenty of water to prosecute work with vigor for 10 hours per day. The quartz ledges are showing up well, and are long this location will attract much attention.

UTAH.

MORRYSVILLE.—Cor. Salt Lake *Tribune*, July 10: The recent strikes in this camp have brought us down a small avalanche of capitalists and experts, the advance guard of what will be here between now and fall. To begin with, the news published in the *Tribune* brought over Jack Oilmer and Professor Jenney "across lots" just in time to learn that through too much waiting, Al Orant, Judge Holderman, Tom Ferguson and others have got 00 days bonds for Chicago parties that enables them to control some of the choicest and best property in camp. Among which I am permitted to mention at present as having been secured from Chicago is the Chattanooga, a five ft ledge of rich silver ore, carrying a small per cent. of copper. The Blue Belle on the east, the Gen. Connor on the west, showing a well defined vein of copper and silver ore, and the Chattanooga No. 2, an extension. This property is all located in Bullion canyon, and whilst the figures are way up in the thousands, the lucky bondholders informed your correspondent that "it is dirt cheap." North of Bullion canyon, one and one-half miles, on what was formerly known as the Copper Belt mountain, now known as the Sonora hill, we have had in addition to the old Copper Belt mine, the deed to which is now held in escrow for the benefit of a Chicago company, the Copper Chief, Sierra Nevada, Hamil and Montreal, on the crest of the hill, all showing true fissure veins of high grade ore. Lower down the hill we have the Sonora, carrying the largest body of ore yet discovered in the camp, with its extensions, the Almana and Sonora No. 2. Immediately adjoining is the Geneva, Eleanora, College, Columbia, Spar, Grow Blade and P. G., all of which were located a few months ago, and from developments made have tended greatly to rouse the camp to renewed vigor, inspire it into confident self-help, and cause us to care less for outside aid. The above named properties are all in one group. The Monte del Rey mine, located on Gold Hill, is rivaling the Deer Trail in its richness, is a very large fissure vein, carrying gold and silver, the former predominating. Over $3,000 has been expended so far in prospecting this property, and arrangements are now being made for further development. Whilst the vein is all in low grade gold ore, it carries pockets of exceedingly rich free gold and horn silver.

Notes on Irrigation.

G. C. Holman, of Lockford, San Joaqnin connty, read an interesting lectnre on the subject of irrigation hefore a union meeting of farmers at Lodi last May. Ws shall give our readers ths parts thereof which seem to us of most general interest:

There ars many inhabited countries where the necessary moisture is deficient. This may bs owing to certain topographic conditions, producing climatic effects, as a deficiency of rainfall, or wbere it is not satisfactorily distribnted; or ths popnlation may hs so rednndant that a larger amonnt of water is required than the usual rainfall, whereby to increase horticultural and agricnltnral prodncts. This deficiency and snpply mnst be fnrnished by artificial and mechanical means. This method, or art, ws term irrigation.

Irrigation, thongh practically new to ns, is at least as old as Mosaic history, that makes Adam the first of irrigators in ths Gardsn of Eden, whers was located a spring, or *cienega*, that watered ths garden. In Enrope, Asia, Africa, South America and Mexico, it is historic, having an existencs of many centuries; and it is still cherished and promoted by soms of the most enlightened nations of ths world. England, France, Italy, Spain, Belginm, Holland and Egypt havs complste systems nnder Governmental control.

Egypt, practically a rainless land, is noted for her fertility and abnndant crops. Yet her aqneous supply comes hundred of miles from the Victoria Nyanza, in eqnatorial Africa, and is applied by artificial means. I well rememher the wonder and interest awakened in my mind in my earliest historic readings, by the descriptions of her immensa irrigation works; of her immense reservoirs, often covering areas of miles in extent; her canals of solid concrets or stone masonry; of the popular interest excited by the annual rise of the Nile; the pageantry, the ceremonies and festivities observed in the opening of the slnices, when a most heantiful virgin was offered as a propitiatory sacrifice to the spirit of ths waters, which were to bless and enrich the land. And Egypt to-day is not less noted for her fertility than in the time of the Pharaohs.

Irrigation in India.

India, whose climate in some respects is analogous to our own, prior to British occnpation had nnmerous canals, fed by the snows of the Himalayas, some of them exceeding 100 miles in length and aggregating thousands of miles, which had heen in use for centnries. And since England has assumed control over that country the government has expended more than $100,000,000 in constructing new works and in repairing those destroyed in internecine wars.

As stated by Capt. R. Baird Smith, an officer of the English Army and of the corps of engineers in India, the main trunk of one of the new canals built under English auspices, is 453 miles in length, and with its four great branches, all navigable like its main trnnk for vessels of great aize, has an aggregate length of 898½ miles. At the head it is 140 ft. wide on the bottom, 170 ft. wide at water snrface, and carries a stream of 10 ft. deep with a cnrrent of 4 miles per hour. The volnme of the water is 6,750 cnbic ft. per second. In addition to its great capacity for irrigation and navigation, it affords extensive water power for driving machinery. And this is ouly one of the many. The effect npon the prosperity of the conntry, even in smaller things, is illnstrated hy the fact that some plantations of trees set along the canal by ths English to gratify the Eastern love of shade, soon repaid them in the sale of timber donhle the ontlay, and timher remaining was estimated at 15 times the cost of planting.

Prohably no part of the vast expenditures of the English government repays so wsll as that upon canals. Retnrns direct and indirect npon some of them ars as much as 36% per annum. Thsir total average is 7.15% per annum. Their effect has heen to reclaim from a semi-harbarons and vagrant life nearly twelve millions of inhabitants, and to make them an industrious, contented people. It affords constant employment for a popnlation of npwards of 200 to 500 to the square mile, and in seasons of great drouth relisves them from the dangers of famine, with which they were formerly visited. Products which cannot be estimated at less than $50,000,000 in that conntry of low prices, is placed hsyond the contingencies of season, andpnhlic rsvenues amounting to $15,000,000 annually, is permanently protected from fluctuations in ordinary times and from annihilations dnring extraordinary ones.

Irrigation in Italy.

Canals have had an existence of centnries in Italy, where the system is more generally applied than elsewhere, and is thoroughly appreciated althongh the annual rainfall there eqnals that of the Atlantic States, and two-thirds of it falls dnring the growing period, say hetween April and Octoher of each year, an amonnt greater than our annual rainfall. The area irrigated is about 1,500,000 of acres, and the great cost of some of tho works, their distribution and application, amonnts in one instance —that of the Wilan Canal, to $400 per acre. These improvements are the work of a vast popnlation and of centuries. They consist of heavy masonry dams, thrown across monntain torsents; of revetments of masonry whicb follow the alignment of rivsrs for miles, in ons instance tbat cams nndsr my notics of 40 miles, protecting ths canals from srrosion of flood without and ths wear within. Canals paved within to prevent their deepening; tnnnels nnder high grounds; aquednets for crossing rivers and valleys; syphons under, ovsr and tbrough canals, and this work gsnerally of rock masonry. Ons is astonished at the evident cost and labor. Yst the water is all eagerly appropriated by the farmer or manufacturer, who would willingly pay for more. Thsss canals havs greatly enriched ths soil and improved ths sanitary condition of the conntry, to whoss productiveness they so greatly add. Thsy have enriched ths land ownsrs and contribnted to the snpport and comfort of ons of the most densely populated districts of Europs. Tbs popnlation of ths irrigated lands in Piedmont is 270 to the sqnare mile; Lombardy, 390; Lodi, 475. And in whatever conntry irrigation works sxist, ths popnlation increases. The holdings are generally small, rarely sxceeding a few acres; hnt in Italy, Belginm and Francs, as I bave ssen, three to five crops ars annually raised, two being in ths ground at the sams time in diffsrent degrees of growth.

Irrigation in California.

Perhaps I have said snongh to impress upon your minds ths great esteem and importancs in which irrigation is held, whers it has bssn the longest and most gensrally practiced. A nsarer illustration may interest yon more. It may be fonnd in the more southsrn counties of onr Stats, in Utah and Colorado, whers it has been practically tested for the last 10 or mors years, and with ths highest degres of profitabls sncess. Los Angsles connty hsads the list in priority of uss, and to some extent thorongh scientific application. The Padres of the varions missions from 80 to 100 years ago, constructed canals and acqnednts to convsy water to the arid plains where were located their religions establishments. Although few of the latter have snrvived, their orange, fig and olive orchards and vineyards still bear witness to thsir enterpriss, zeal and devotion. The total watershed which supplies ths conntiss of Los Angeles and San Bernardino, under one systsm, amounts to about 500 cubic ft. per second, transmitted in 126 canals of an aggregate length of 440 miles, irrigating 64,490 acres. Thess canals supply a large number of flonrishing settlements, ths popnlation of which are engaged in the cultivation of the vine, the orange, lime, olive and other semi-tropical frnits, besides the usnal field products, with best pecnniary resnlts. And it mnst he borne in mind that without water artificially applied, much of these natnrally fertile, hut arid lands would be nearly worthlsss for agricultural pnrposes. Bsfore irrigation works were constrncted mucb of the land was sold for $2.50 per acre; now it is said to be worth $100 per acre, unimproved.

Mainly within tbe past ten years the people living in the vicinity of Kern, King's, San Joaquin, Merced and Stanislans rivers, have had the foresight and snergy to construct canals and direct the watsrs to irrigate the otherwise dry and sterile plains. The canals have multiplied and flonrishing settlements havs sprung up along the line, adding wealtb and popnlation to the conntry. Areas of vines, wheat, barley, corn, beans, alfalfa, cotton and other crops are grown that astonish even the natives; and I was equally astonished at tbe sesmingly fixed and prolific crops of the infantile and yonthfnl native, and became satisfied there wonld eventnally be no lack of edncated and practical irrigators, which the country needs.

Some of onr political economists have proposed that the drainage or cachement area of the conntry embraced in what is called the San Joaquin and Tulare valleys, opening to the north with a downward slope, and the Sacramento valley opsning to the sonth with a downward slope, their waters nniting in Suisnn bay, should he ntilized hy the constrnction of grand trunk lines, following hy an easy grade the line of the foothills on the sast and west side of the drainage center of these vallsys, and receiving ths waters of the varions rivers which wonld intersect them.

It is svident that a work of this magnitnde could ouly be nndsrtaksn nndsr the anspices of the Stats, as a Government work; but this would be in my opinion, antagonistic to the best public interests. In the first place, onr rivers generally leave the foot-hills at right-angles with the drainage system of the valleys, and the topography of their nighborhood assnmes a parabolical form which rendera their local application to irrigation the most economical and convenient. Again, as matters now go, jobbery, surpassing that of "slickens" would he fastened npon the people in the shaps of hnrdensome taxation for years to come.

It would, however, hs well for the State to assume the proprietorship of all nnappropriated waters, and snpervise their conservation and equitahle distrihntion, thns preventing furthsr monopoly and wasts hy speculators or improvident claimants.

I approve in general terms (thongh with sxceptions) of the work that is now heing prosecuted under the snpervision of onr State Engineer, in the varions departments to which hs has been assigned.

A Patent Suit.—An action has bsen commenced in the United States Circnit Court, hy John J. Johnson, to recovsr $25,000 damages from A. Lusk, W. Jacohs and J. Kleinhaus, for the alleged infringement of a patent soldering apparatus, and to enjoin the defenants from the further uss of the same.

Editor and Contributors.

It has always been ons of our sditorial tenets that ths strength and usefulnsss of a journal lie not alons in its subscription list and in its editortial chair, but in its power to draw out the thonghts, observation and sxperiencs of its readers, in ordsr that each may snjoy ths truth and snccess which all have discovsred, or attained. Our ideal jonrnal is one which shall present each snbject in ths light of tbe freshest research and ths widsst experiencs. If a comet flasb in the sky, lst ons who has made astronomy a carsful study tell ths people, in a style every one can comprshend, just what is known abont it, and what, according to ths best knowledge of snch bodies, will bs its future. For the lack of snch authoritative statemsnt and from ths nnbridled fancies of rsportsrs, which occnpied space which should bave been better used, thsre are donhtless some peopls who believe that ths comet now visible is rsvolving around ths polar star. And, dropping to mundans affairs, the papers ars filled with ths imaginings of nninformsd writsrs on social and industrial subjects until ths public mind is charged with idsas on nearly all thsmes which ars crude, untrue, and apt to mislead. For such deception and misguidancs of the popnlar mind, ths editor is responsible.

Thsre is scarcsly an issus of a journal which does not contain some statement of fact or dsdnction therefrom which is in reality an untruth, in essence and in infsrencs; and there are readers, few or many, who know it. In the public interest it is the duty of the knowing one to correct the error, and the editor should welcome the new light and haste to shed it forth. In this way the public wonld be edncated in the truth, both in small things and great, and the result is delightful to contemplate. We admit that editorial conceit would receive a stnnning hlow, and we see no reason why editorial conceit should bs spared the crushing. It is an old dogma that an editor should hs omniscient, and that journalistic dignity will not admit a correction of any kiud. The jonrnal will never be true to its mission nntil snch narrow ideas ars swept away.

But we did not intend to writs a homily upon editorial condnct in general, but rather to point out olearly what we belisve to he one way in which a journal may be brought np to the highsst intelligsnce of the time and press most clossly to the popnlar beart, and that is by encouraging its readers to freely contrihnte the trnth which in them lies, whether it bs a point of international law or ths growing of a turnip. Much depends upon the editor whsther his journal shall havs a reputation for the fullest truth and accnracy on the subjects it discnsses, or whsther it shall slash around so that the lawyer may laugh at its ignorance one day, and the farmer denonnce it as a pack of nonsense the next. If the editor is courteous toward contribntors and welcomes thsir favors, the lawyer will be glad to set him right in the pnblic interest, and the farmer will ransack his honse for writing matsrials to tell him that he can't make a pound of hntter from five lbs. of milk. But if the editor shows that hs cares more for what he has said than for the truth and if the waste baskst is proclaimed the largest piece of fnrniture in the sanctum, the editor will naturally hs left alone with his conceit and the propagation of error and fallacy will contInne.

We are led to these rsmarks by the perusal of an interesting article in an English magazine concerning Dickens as an editor, and we are proud to know that ideas and methods which we have held and practiced in onr modest experience, were characteristic of him in his editorial conduct. The writer shows that he was most kind in his treatment of contributors, and in this way drew out their best efforts and enriched his jonrnal hy them. We have not spacs to cite ths many instances of this behavior which are givsn. In one place, alluding to Dickens, the writer says:

> It is in his relations with writers in his periodical, and, indeed, in all connections with his "literary brethren," as he modestly calls them, that this amiahle and engaging man appears to the most extraordinary advantage. As I read over his many letters on those points, I am amazed at the good-natured allowance, the ontiring good humor, the wish to please and make pleasant, the almost deference, the modesty in one of his great position as head, perhaps, of all living writers—to say nothing of his position as director of the periodical which he kindled with his own perpetual inspirations. There was ever the same uniform good nature and ardor, the eagerness to welcome and second any plan, a reluctance to dismiss it, and this done with apologies; all, too, in the strangest contrast to the summary and plain-spoken fashion of the ordinary editor. This patient interest should, in these editorial matters, become more wonderful when it is considered that his position as head of an important periodical made him a marked figure for importunity. I believe every composition was seriously glanced at, and some estimate made—and many an obscure, clever girl was surprised to find her efforts appreciated

The writer of this tribnte to Dicksns as an editor, and who, we imagine, is himself one of the best known of living novelists, proceeds to show the patient labors of the editor in "tonching up" contribntions, which it mnst he acknowledged is often a severs task, hut which no true editor will shrink from, providing there is merit in the article. He writes:

> I have many proof-sheets by me, corrected hy his own hand in the most painstaking and elahorate way. The way he used to scatter his bright touches over the whole, the sparkling word of his own that he would insert here and there, have a surprising point and light. The finish, too, that he imparted was wonderful; and the "dashes," stops, shiftings, omissions, were all valuable lessons for writers. Now, this was all encouraging and cordial to a degree. I frankly confess that, having met innumerable men, and having had dealings with innumerable men, I never met one with any approach to his genuine, unaffected, unchanging kindness.

It would be well for jonrnalism if ths spirit of Dickens wers invoked in every sanctum in the world. If all the mole-eyed conceit which rules in editorial chairs could he melted away in the sunny welcoms to worth, which was his constant disposition, how mnch that is trus and valnable wonld pnsh from the colnmns the vapid gensralizations, ths gross inaccuracies and the glaring untruth and injustice which ars too prsvalent. Ws believs that this will bs the futnrs of jonrnalism. Such policies are gaining gronnd and ths people ars every day learning to distinguish mors and mors in favor of trne gentility, and lovs of truth for its own sake, in ths journals which they support.—*Rural Press.*

The Goose Creek Mountains.

Copper and Gold Mines.

Sheriff Hanks and D. H. Jackson have returned to Virginia city from a trip to the Goose cresk mountains, where they havs located soms very promising mines. Ths *Enterprise* says that Shsriff Hanks found ths ledges abont nine years ago and did soms work on them, hut ths predominant mstal being copper, and thers being at that time little said abont copper, hs did little more than to make snch explorations as showed him that hs had an almost unlimitsd amount of ths ors. Not only is ths ore rich in copper (running from 15% to 50% in that metal), but it also contains much free gold. This gold is found embedded in the midst of solid massss of rich copper.

They brought home with them over 100 lbs of the ors, and are now having it carefully assayed. It appears probable that the gold contained in the ore will much more than pay all expenses of working, leaving as further profit the full value of the copper.

Messrs. Hanks and Jackson located four ledges, which are from 18 inches to 7 ft. in width. In thess they havs in sight on the surfacs a great amount of ore and there are on the dnmps (dng out by Mr. Hanks years ago) hundreds of tons of the ore.

Thsy have bonded a silver-hearing lode, situated in the same region, which promises to bs of great valus. The lods crops out for a mile or two and averages about 12 ft. in width. In the narrowest place to he found the vein measnres 4 ft. from wall to wall.

The gentlsmsn were absnt from this city but sight days, therefore had not time to do much prospecting, but say thsre is a fins field for prospectors. The only man in the section of conntry visitsd by them is a ranchman; no prospsctors in ths place. The conntry is everywhere covered with float quartz. The only ledges that havs evsr besn sven snperficially examined are those that crop out; no ons has done anything toward following up float and unearthing such veins as havs heen covered up—the blind ledges.

The mines are hut 40 miles from Tscomo, on ths Central Pacific, and from them to the railroad the country is level, and an excellent wagon road may easily bs made over which to transport ors and supplies.

The country is well wooded and watered and contains mnch good agricultural and grazing land. Game is abnndant, not only doves, rabbits, sagehens and prairie chickens, but also deer, monntain sheep and other large gams. Altogether it is about as fine a country for the prospector as could well he imagined. The mines lie in the extreme northeast corner of Nevada, bnt a few miles south of Idaho and a few miles west of the Utah line.

From Alaska.—M. W. Murray, of this place returned this week from Harrisbnrg, Alaska, where he has heen since February last, prospecting and looking after the interests of a company of which he is a member. Mr. Murray tells no tales of the prospective fabulous wealth of that far-off land, but brought with him a numher of quartz specimens, the richness of which calls hright visions of fortune to the minds of those who have seen them. Without exaggeration, we regard ths specimens as indicative of richer gold quartz mines than any ever hefore discovered. Ths rock is in large pieces, and to nse a minsr's phrase, is "perfectly lousy with gold." Thsy are not selected small specimens, but fair samples of the quality of the ledges discovered as far as they have been prospected. None of the lodes have as yet been snnk on to any considsrable depth, in fact have not heen touched more than a few ft. below the surfacs, hut give every indication of heing hoth extensive and rich. They are located from three to four miles hack from ths coast, and on a monntain. So far, comparatively few discoveries have heen made, hnt more are anticipated, as the 200 men now in that section ars doing a great deal of prospecting. The specimens brought by Mr. Murray are from six or eight different minss. Placer mining is heing done in the neighborhood of Harrisburg, and is said to pay from $5 to $20 psr day to the man. The cost of living there is ahont the same as here. Mr. Murray goes from here to San Francisce and thence hack to Harrisburg, from whers he promises to keep ns posted regarding furthsr dsvelopments in that section.—*Trinity Journal.*

There are 10 or 12 arastras at work between French Gnlch, Shasta county, and the mouth of Deadwood.

The Mining Field East of San Joaquin.

Adventnrous prospectors, who leave California to encounter the hardships and dangers of gold-seeking in the fnr northwest, and others whose love of change leads them to the uncertainties and roasting climate of Arizona aad Now Mexico, soldom consider the fnct thnt they leave eqaally if not far more promising fields at home. The minernl range, extending from Sntter creek, Amador county, southward through Cnlaveras nnd Tuolumne counties into Mnriposa, is to-dny the most inviting field for ths investment of cnpital in miaing industry on the Pacific coast. During the early days of Placer mining, botb Calaverns and Tuolumne were celobrated for the richness of easily accessible gold deposits in the gulches. What early sottler forgets the enormous quaatities of gold obtained in the noigbhorhood of Mokolumne hill, aad in the aumerous localities south, in the direction of San Aadreas, South Calaveras, Cberokee Flat, Altaville, Angels, Carson Hill, and across the Stanislans river into old Tuolumae, which ia early days gained a wide reputation for riches on accouat of the numerous fortnaes acquired by miners in Woods' creek alone? The ledges from which these enormons amounts of fragmentnry gold must have heon detached are still comparatively untouched. A few rich, permanent mines have been developed at snndry poiats in those two counties, as well as in Amador; hut the main body of gold-bearing quartz remnins as undisturbed as before the disoovery of the precious metsl on the coast was first made kaown. In the northeastern part of Calaveras, in the neighborhood of West Point, Railroad Flat, Rich Galch and sarrounding hills, qaartz lodes rich in gold have loag beèn known to exist, hut efforts to introdace the most approved and economical means of development have been comparatively limited. Now and then a rich strike is reported, aad encouraging accounts of the profitable development of a mine here and there are givea, bat the fact that little has heretofore been done in the way of briaging capital and energy to bear in developing the richness of that section, on a scale commeasurate with the outlook, made encoursging by discoveries already made, canaot be denied. Dnriag the past few years the mining indastry in the counties named has been manifestly improving, and it would improve still more rapidly were the capital and enterprise of our own State more disposed to look with favor upon realities at home instead of taking speculative risks in remote territories. It would he nonsense to conclude that the few paying mines in Amador, Chili Ridge, Sheep Ranch, Angels, Carson's, Murphy's and Vallecito, in Calaveras county, and a small number of mines successfnlly operated and notable for their richness in Tuolumne county, embraced one-thousandth part of the rich gold deposits in the district. Now that settlers can obtain title to the mines and farms along the mineral belt, a new ora of prosperity may be reasonably expected. Permaaent settlement is one of the first essontials of prosperity. So loag as the people of the mining counties were, in the main, nomads, wandering from gulch to ravine, and from riverbed to hillside, as faacy and hope of obtaining a little of the precious metal might dictate, the kind of prosperity that brings comfort and riches to communities, and wealth to the State, could hardly be hoped for; but permanent settlement can hardly fail to assnre healthy development of latent resources. There is nothing better calculated to speedily infuse new life and vitality into all kinds of indnstrial pursuits at home than the judicious investment of capital in the quartz mines near the populated centers in our State.—*Stockton Independent.*

Shasta County Mineral Resources.

The sale of the Copper city mining and milling property, owned by the Extra M. Co., to a party of English capitalists, is, as we understand, substantially effected, and only awaits the signatare of some parties interested but absent and acquiesciag in the agreement of sale. The Copper city property is one of magnitude so great that the mere mention of the facts known in regard to its richness, would challeage the criticism of the sceptical and doubly stimulate the "marvellous" lump of those who are marked "low" on that protuberance by Prof. Fowler. In Copper city hills Nature planted a wealth and profuseness of precious metals, that when revealed by the stroke of the miner's pick aad giant blast, will outrival the gorgeous vision revealed by the flash of Aladdin's lamp. The simple record of the bullion shipments made by the Extra mining company, that have been made public, is enough to ehow thst the Bully Hill Extra, and Jennie June mines alone are sufficiently rich in the way of gold and silver production to more thsn equal many of tho dividead psyiag mines quoted ia the San Francisco and Eastern stock markets.

Next to Copper City in mineral value, in proportion to the dovelopments so far made and the indicatioas of what may be expected, looms up Iron mountain. Within that iron-bound crucible Nature has worked her retorts, and the amalgam is at the disposal of the tappers of the retorts, snd the tappers are not idle. Within the next few montha will be shown a miaeral development in the mountain, at the very base of which our children play, that will astonish the miuing world. And old Shasta residenta and pioneers, whose lines are cast in far different places, may expect to soon hear of news that will make them long to be in the new El Dorado.—*Shasta Courier.*

Useful Information.

Why Woolen Fabrics Shrink.—The fibers of wool and certain kiads of hairs, are toothed or jagged at the edges, the teeth (or imbrications) poiating upward—that is, from the root to the poiat. When subjected, therefore, to compression or friction these fibers, being free to move only in one direction by reason of these asperities of sarfnce, have a great teadeaoy to anite aad lock together. This explains the peculiar capnbility possessed by wool, of felting, aad also the shrinking of fabrics of wool. In the latter caso, tho excessive rubbing to which they are subjected causes a matting or binding together of the altimate fibers, which causes shrinknge; and this is iatensified by changing the goods from hot to cold water, wbich is usnally practiced, ns the contraction of the fibers which this canses is itself a felting proaess. For washiag woolen articles, it is recommended to place them ia warm wator, never in cold; and if changed from one water to another, they should go from hot to hotter. They should be oleansed with as little and as gontle friction as possible. The fibers of cotton and linen are straight and smooth, and possess none of the surface roughnesses that characterize the struotnre of wool, henco they do not shrink in washiag.—*Manufacturer and Builder.*

Covering for Boilers and Steam Pipes.—The following is a French idea: The surfaces are covered with sawdust mixed with flour paste. If the paste is not very liquid, the mixture heing nsed in the form of moderately stiff dough, and the surface of the boilers or pipes have been well cleaned from grease, the adhesion is perfect, aad the material is free from cracks. Five layers of this composition are recommended, each about one-fifth of an inch thick. It is said that one inoh of this composition will give better results than double that amount of the materials nsually employed. The paste is composed of rough flour without the addition of starch. The mixture can be applied without a trowel, and if there is much exposure, twa or three coatings of tar will render the composition impervious to water. Copper tubes should first be treated to a hot liquid solntion of clay, so as to iacresse the adhesion of the sawdust.

Elephant's Milk.—Dr. Charles A. Doremus hns been much interested in an analysis of the milk of strange animals. His greatest difficulty was to get the milk. When Barnum's show was here he interviewed a lioness, but her claws were two long and menaciag. He did, however, succeed in getting a sample of the food npon which the only American-born baby elephant was brought up. Dr. Doremns gave an account of his analysis before the American Chemical Society. He said it was no wonder that elephants were snch great, hearty, overgrown animals, because the milk upon which they are nurtured is the richest he ever saw. It contaias less water and more butter and sngar than almost any other kind, and has besides a delightful flavor and odor. It is about half cream, and the butter made from it, which is rather softer thaa tbe ordinary butter, is very rich. The oil extracted from it is clear and like olive oil.

The Finest Floors are said to be seen in Russia. For those of the highest grade, tropical woods are exclusively employed. Fir and pine are never used, as in consequence of their sticky character, they attract and retain dust and dirt, and thereby soon become blackened. Pitch pine, too, is liable to shrink, even after being well seasoned. The mosaic wood floors in Russia are of extraordinary beauty. One, in the Summer Palace is of small squares of ebony inlaid with mother of pearl. A considerable trade is done in Dantzic and Riga by exportiag small blocks of oak for parquet floors. There is an active demand for these in France and Germany, but none in Eagland.

Wood-Topped corks are novelties recently brought out by an American firm, of New York. The cork is provided with a cap of wood, which greatly facilitates its removal from a vial or bottle, and forms a very elegant finish. Owing to its breadth, the cap can be grasped in the same way that an ordinary "mushroom opener" is held, and sufficient torsion exerted to dislodge it without the necessity of resorting to a corkscrew. The cap is provided with a central vertical projection, which is glued fast in the center of the cork, so that the latter must be destroyed before they can be separated.

To Prevent Colors Running.—It is said that a teaspoonful of black pepper will prevent gray or buff linen from spotting if stirred into the first water in which they are washed. It will also prevent the colors running, when washing black or colored cambrics or muslins, and the water is not iajured by it, but just as soft as it was before the pepper was put in.

Water as a Deodorizer.—Water is a much better deodorizer than ia generally anpposed. It has great absorbing capaoity. Fresh water running through a milk room keepa it free from odors. Standing water soon becomes charged with odors, and then givea them off again. Water used in a milk room to cool the milk ia a great purifier, bnt mnat not be allowed to stand more than 12 bours before being removed.

Discolored Brick Walls.—The white saline substance that "comes ont" npon brick wnlls, nnd which has beea a sonrce of annoyance to n great many, mny, acoording to the *American Architect*, be remedied. In reply to a qaery oa the subjoot, it says: The "saltpetoring" of brick-work can gcaerally be preveuted by ndding oil to the mortar at the rate of a gallon to the cask of lime. If cement is nsed in the mortar, an additional gallon of oil must be allowed for each cask of cement. Linseed oil is generally employed, bat any kiad that does not coatain salt will answor. The incrustation, once formed, can be removed with hot water, or by the muriatio acid generally used for cleaning down brickwork, but it will reappear again by exudation from the interior of the wall, and nsually leaves a permaaent black, or brown stain.

New Mode of Sugar Adulteration.—By a recent iavention, starch or corn sugar (more generally known as *glucose*), heretofore qnite extonsively used hy confectioners, brewers, etc., has been made sufficiently dry and wbite so that it can be powdered and mixed with yellow sugars. It rnises the standard of color largely, but not being so sweet, reduces the sscchsrine streagth, making it necessary to use more of the article to attain the usnal degree of sweetness. Large qnantities of this mixture are now beiag made and sold nndor various brands in tbe New York market.

Wear in Wire Ropes.—Dr. Chance, in discussing this subject at a lato meeting of the Engineers' Club of Pbiladelphia, drew the conclusion that the cause of rapid wear is often due to the use of drums, sheaves aad pulleys of insafficient size, aud that a great saving might be effected by increasiag their diameters, especially that of the small deflectiou and knucklo pulleys and sheaves. The actual wear averages 0.138 cents in slopes and 0.053 cents in shafts per ton for each 100 ft. of lift.

To Detect Soapstone Adulteration.—Detection of adulteration with soapstone in candies, sugar, flour or butter is not at all difficult. Dissolve the suspected candy or sugar; the insolable mineral will remaia. Burn a sample of suspected flour; an excess of ash will betray the cheat. Melting and filtering will do the same for suspected lard or butter.

Iron or Steel immersed in n solution of carbonate of potash or soda for a few miautes will not rust for years, not even when exposed to a damp atmosphere.

Good Health.

Water as a Part of Diet.

Many persons drink ordinarily as little water as possible, and none at all at meal times, because they suppose that water dilutes the gastric juice. Experiments, however, show that dilution does not diminish the digestive power of the gastric juice, and further, that water alone, as well as solid food, awakens its secretion.

A paper, read by Dr. Webber, of Boston, at a meeting of a learned medical society, took the ground that water, used moderately at meals, is beneficial, and that a large class of people drink too little.

The result is, if too little water is drank—especially if the person eats heartily—the perspiration and the kidney secretions are diminished. Not only they, but the waste of the system which can be removed only in a state of solution, is not eliminated with sufficient regularity and fullness, and tbe system becomes gradually clogged by it. The accumulation is slight from day to day, but in time unpleasant symptoms are developed.

Theee symptoms are of an indefinite character—discomfort, even pain, sometimes in one place and sometimes in another, constipation and nnhealthy hne of the skin.

"Patients," says Dr. Webber, "who drank no more than a pint of water a day, have told me that they were not thirsty. They were surprised when told to drink more. Those who have followed this suggestion, in the course of a week have developed thirst, and drank as many as three pints of water a day."

We may add that water taken into the stomach is at once rapidly absorbed by the blood vessels. A bowl of well-seasoned broth as a first course is specially helpful to the above class of patients. A large quantity of ice-cold water is harmfnl to any one.

Dr. T. C. Duncan, in his book entitled "How to Get Plump," shows the necessity to the human system of frequent draughts of water. The Doctor says that "few people appreciate the fact that water constitutes in the normal human subject ahout 70% of the entire weight of the body. The water which thus forms a part of the animal frame is derived mainly from without. It is taken in the different kinds of drink, and also forms an abundant ingredient in the various articles of food. Water is abundant in the blood and secretions, where its presence is indispensable in order to give them the fluidity which is necesoary to the performance of their fnnctions. Water is therefore an esaential ingredient of the fluids, for it holds these solid materials in solution and enables them to pass and repass through the animal frame. Water ia also an ingredient of the solids—mnscles, tendons, cartilagee, bones, teetb, glands, skin, etc. If the water of tendons, skia, etc., be evaporated they become yellowish in color, shriveled and unfit for performing their functions. This accouats for the sallow appearaace of lean people. With these facts before us, coatiaues Dr. Duncan, we can readily understand why a person who does not take much water except in food is leaa. Lackiag the necessary fluidity, the functions are all performed with difficulty. Many cases of dyspepsia are duo to lack of wnter. Many cases of headache can be relieved by increasing the fluidity of the blood. Many a case of functional palpitation of the heart can he mitigated by increasing the volume of the circulating fluid with an extra pond of water. I generally order a half-pint of water to he taken four times a day, early in the morniag, about 10 A. M., abont 4 P. M. and before retiring. I forbid cold water to be taken at meals, for the reason that the stomach is then at its highest functional activity, and cold lowers its temperature aad retards digestion. Warm fluids, like milk aad water, facilitate digestion.

Incurable Insanity.

To be hopelessly insaae, how terrible; worse than denth itself. There are some singulnr facts in refereace to insanity. New England gives the largest per centage of all sections of the Union, aad the extreme Southern States the least. In some Northern locnlities, there is one insane person to every 600 of the populatioa, while in the South, especially among the negroes, there is not one in 6,000.

Another strikiag fact is, that the asylums in this coantry have a larger number of inmates from among the farming population than from among any other calling. This is accounted for in the sameness, the horsemill life of a farmer; he trudges along ia the same track from one decade to aaother, bringing into requisition a single set of mental eaergies, while all the rest remain dormant to a certain extent; and grow wild like an undisturbed field. The fact is, no man was ever made to be a loafer, not even as to a nart of his faculties, corporeal, meutal or moral. There is enough to do in these ages of the world, to keep every son and daughter of Adam at work all the time of his waking existence, not at mind work alone or body work alone, but mind and body both at work all the time of working hours. It is because of the partial loaferism of the multitude that so many of the truly good among us perish before their time. Often is it that when men find a competent and willing worker they impose on him the duties of a dozen mea, and the inevitable result is that in a few years he is literally worked to death.

The true lesson is, let the multitude do more and the few less, theu will not these few die before their time, and then too, will not the multitude overcrowd our lnnatio asylums as they now do, no less than 561 being in a single hospital in Massachusetts. — *Hall's Journal of Health.*

Help The Children Grow Erect.—William Blaikie, the anthor of "How to Grow Strong and How to Stay So," spoke before the Brooklyn Teachers' Association recently on "Physical Education." "I want" said he, "to see if in an informal talk we can't hit upon some way in which we can bring the physical education of school children down to a practical basis. Our children who are healthy aad buxom when they begin school work, come out pale, sickly, and with round shoulders. If you require the childreu under you to sit far back on a chair and to hold their chins up you will cnre them of being round shouldered, and the lnngs and other vital organs will have free and healthy play. Another sample plaa is to have the children bend over backwards until they can see the ceiliag. This exercises for a few miautes each day will work a wonderful transformation. If a well-qualified teacher conld be employed to superintend the physical developmeat of the children the best results would be seen.

Sign of Death.—Dr. Chiappoli stated that he has frequeatly noticed in patients, apparently far from death, an extraordinary opening of the eyelids so as to give the eyes the appearance of protruding from their orbits, which was invariably a sign that death would occur within 24 hours. In some cases, when only one eye is wide open while the other remaias normal, death will not follow quite so rapidly, bnt it does take place in a week or so. It is easy to observe this phenomenon when the eyes are wide opea, but whea, as is generally the case the eyes are half shut and only opea from time to time, and it will be advisable to fix the attention of the patieut on some point of light in order to see the change. Chiappoli is utterly at a loss to explain this symptom of approaching dissolution, and ascribes it to some diseased state of the sympathetic nerve.

The Teeth —All mineral as well as vegetable acids act promptly on the teeth. In 48 hours acetic, oitric and malic acids will corrode the enamel eo that you may scrape a great portion of it away with the finger aail. Acid tartrate of lime, having a greater affinity for the lime of the tooth than for its own base, will rapidly destroy the enamel. Grapes, in 48 hours, will render the enamel of a chalky consistence. Vegetable substances are inert till fermentation takes place and acetic acid is formed. Sugar has no deleterious effect, only in the state of acetous fermentation. Animal substances exert no injurioua effect until putrefaction is far advanced.—*Scientific American.*

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Desulphurizing Compound for Ores; Lubricators for Air Compressor Cylinders; The Pacific Galena-Silver Smelter; The Utah Mine, 33. The Sweepstake Quarts Mill; The Engineers and the Debris Dams; New Hydrocarbon Furnace; The Brush Dams; Mining Rulings; Mines in Indian Reservations; Passing Events, 40. Hurdy-Gurdy Water Wheel; A Curious Ore Separator; A Promising Mine; A Gift to the University; Ore Concentration, 41. Notices of Recent Patents; The Industrial Fair, 44.

ILLUSTRATIONS.—The Pacific Galena-Silver Smelter, 33; Sketch of a Wheel and Gear; A Section of the Rim, 41.

CORRESPONDENCE.—The Owens River Country; Inter-Mercurial Planets—No. 2, 34.

MECHANICAL PROGRESS.—The Model Machinist; How to Work Mild Steel; Suggestions to Purchasers of Machinery; Useful Tempers of Steel; Wooden Boilers for Steam, 35.

SCIENTIFIC PROGRESS.—The Gypsum Test for Milk; Electricity and Wool Spinning; Originating New Ideals; Of Scientific Interest; Electrical Paper; Blonde Hair Changed to Black; Important Discovery; Sulphide of Bismuth; Population and Altitude, 35.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Dividends, 36.

USEFUL INFORMATION.—Why Woolen Fabrics Shrink; Covering for Boilers and Steam Pipes; Elephant's Milk; To prevent Colors running; Water as a Deodorizer; Discolored Brick Walls; New Mode of Sugar Adulteration; Wear in Wire Ropes; To Detect Soapstone Adulteration, 39.

GOOD HEALTH.—Water as a Part of Diet; Incurable Insanity; Help the Children Grow Erect; Sign of Death; The Teeth, 39.

MISCELLANEOUS.—Mine Jumpers; Salt Spring Valley; Ores of the Montana, 34. Notes on Irrigation; Editor and Contributors; The Goose Creek Mountains; From Alaska, 38. The Mining Field East of San Joaquin; Shasta County Mineral Resources, 39.

Passing Events.

The gift of D. O. Mills, Esq., of $75,000 to the University of California, is very opportune. Mr. Mills gives this handsome sum to our chief educational institution at a time when changes in its management and criticism brought about thereby, make thoughtless people imagine the University in a bad way. Mr. Mills, who was one of the Regents and knew all about it, would not give such a sum to a moribund institution. It is to be hoped his example will be followed by other millionaires.

News from the north this week confirms the theories of the loss of the missing whale ships. Natives have seen the vessels with dead bodies on board. No tidings have come from the *Jeannette*. The winter was mild, and we may expect any time to hear from her.

The quartz and porphyry found in the south header of the Sutro tunnel carries some little metal, and is looked upon as an excellent indication of an ore body near at hand. The development is 50 ft. north of the south line of the Yellow Jacket.

The wounded President still continues to improve, to the great joy of all right minded citizens. It seems now that all danger is evidently past.

The Wood River country still continues to attract great attention, and the large number of prospectors now there ought to insure a great many new discoveries this summer. Many mining people are going down into Mexico, but, judging from late reports from some sections, it is not a pleasant place to travel near the borders. Several people have been killed by Indians, and numerous parties have been fired upon.

The Sweepstakes Quartz Mill.

We had an opportunity of examining, a few days since, the Sweepstakes quartz mill, which is in working order at the Oakland planing mill, Oakland Point. The machine, which is the invention of A. E. Redstone, is manufactured by the Sweepstakes Plow Co. The quartz mill carries the stamps in a revolving frame or face-plate, flanged friction wheels furnishing guides to the stems. The bosses, shoes and dies are adjusted the same as in the ordinary battery, the dies being in three segments of a circle around an inside cone, in which the perpendicular shaft rests. To this shaft is attached the revolving face-plate and bevel wheel, on which the pinion meshes that is keyed to the pulley shaft.

The cams, upon which the rollers or wheels which raise the stamps are attached, are placed on the outside of rim or curb. Upon the center being revolved, carrying the stamps, they are carried up the horizontal cams by these rollers—each stamp having its own roller—and, gaining the highest point, are dropped. As they drop they strike an angular blow, or rather a glancing one, then grinding on the quartz as they slide around on the die, until they are lifted by the next cam.

The mill we inspected carries eight 125-lb. stamps, drops five inches with the accelerated force of the revolving movement of the speed at which the stamps are carried around. The whole mill weighs 2,650 lbs., eight stamps and all. There are 48x14 inches, of screen surface. The mill requires comparatively little power, and it is possible to run it by hand. With one cam acting and running at 144 revolutions, it strikes 1,152 blows a minute. We saw it at work with three cams in place, each of the eight stamps dropping three times a revolution, the mill thus striking 3,456 blows a minute, with 125-lb. stamps dropping five inches.

The cams are easily removable, and one, two or three may be used. With one cam only, each stamp, after its drop is slid around the die the complete circle till it reaches the cam, grinding the quartz for the entire distance. If two are used, it drags half way, lifts, strikes the blow and drags again. All those stamps not in the act of rising are grinding or performing the work of millers in a pan. Both shoe and die wear uniformly and smooth, so the iron can be worn down to the last half inch, there being no ragged, rough surface.

The owners of this new mill will have one or more of them in practical operation during the Mechanics' Institute fair, when miners and mill men can examine them at work.

The mill is portable, and is made all ready to attach to a belt. The heaviest piece is 125 lbs. It can be run by horse power, as well as by steam. A miner can pack one on burros, and then make the burros run it, thus utilizing his means of transportation as power.

The No. 1 prospecting mill weighs 775 lbs.; No. 3, 2,650 lbs.; No. 4, 7,000 lbs. No. 1 is calculated to crush 400 lbs. an hour; No. 2, 1,000 lbs. per hour; and No. 4, 4,000 lbs. per hour through a No. 60 screen. No. 1 carries seven 35-lb. stamps, and strikes 1,400 times a minute; No. 3 carries eight 125 lb. stamps, and strikes 1,680 times a minute; No. 4 carries sixteen 300-lb. stamps, striking 3,840 times per minute, grinding the distance between the inclines. No. 1, the prospecting mill, is sold complete for $300; No. 3, $700; No. 4, $2,000. Mr. Hill says that No. 1 requires half-horse power—a burro; No. 3, one-horse power; and No. 4, less than six-horse power. All the mills have an extra set of shoes and dies.

The mill is certainly compact and portable, and is a sort of combined battery and pan. The grinding feature, for "rusty gold" would be advantageous. For prospectors' use the No. 1 mill is the lightest of anything of the kind we have heard of, and the slight power required to run it is a great advantage. We thought perhaps the grinding action would use up a good deal of iron but Mr. Redstone and others who have used the mill, say that this is not the case, since the shoes and dies wear down smooth and even, and there is no breakage. This may be used, therefore, until entirely gone, which is not the case with ordinary stamps. Several of these mills are now at work in mines in this State.

Mines in Indian Reservations.

The Commissioner of the General Land Office in reply to the settlers upon the mineral lands of the Ute reservation, says: "In your communication, you request to be informed by what means persons now in occupation of valuable mining claims, which within a few months have been ascertained to be within the limits of the Ute reservation, may maintain their possession. You state that these claims have been located at various times since 1876, under the supposition that they were situated upon public lands subject to sale, and outside the Indian reservation; that the claims have been sold in instances for large sums of money (aggregating from $3,000,000 to $5,000,000) to equally innocent purchasers; and that since the fact that these claims are situated in Indian country has been ascertained, many of them have been 'jumped' by outside parties.

Notwithstanding the hardships which accrue from the facts stated, it is perfectly clear that none of the locations made are legal, and the locators were and are trespassers, though, perhaps, not intentionally so. The 'jumpers' are wilful trespassers. No valid possessory title has been or can be acquired until the land is declared subject to occupation, and the parties who have made locations and those who have purchased claims, have no possessory rights which can be maintained."

The Engineers and the Debris Dams.

Col. Mendell and other engineers and experts have examined the brush dams on the Yuba and Bear rivers, with a view to learning their present condition and to observe their effects. All parts of the Yuba dam were thoroughly inspected, and it was found to be in very good condition. Commissioner Knox says:

We found two breaks in the Yuba dam. One was from 300 to 400 ft. wide, and about a quarter of a mile from the south end. It appears that the whole structure at this point has gone out. About half a mile farther on is the other break, which is in the neighborhood of 700 ft. wide. There are evidences of brush remaining at places over the break along the bottom, but this cannot be definitely determined now, as the river is still running through these nearly the whole width. The most of the way, however, it is only a few inches in depth, but the slickens beneath is soft and not inviting to an over degree of curiosity. From this point to near the north end of the dam no injury has been done whatever, and so far as can be seen the crest has not settled in the least out of range. The top of the dam is covered with heavy driftwood, much of which is composed of logs two ft. in diameter, which have caught upon the crest and been left there as the river fell.

Above the portions of the dam where there has been no breaks, the sand and gravel is filled in and retained within two or three ft. of the crest of the dam, and the fight is apparently continued with ascending grade as far up as can be seen, with an occasional small bowlder two or three inches in diameter. Upon the lower side of the dam the sand is from 4 to 6 ft. lower than above. From immediately below where the water pitches over the dam, and down for a distance of several hundred ft., there has also been a large deposit of debris caused by the slower movement of the water, and which grows less again as the water regains its velocity.

Within the dam, where the breaks occurred, of course the sediment which had been filled in was carried through and into the river again below, and channels with sloping sides are thus formed inside the dam, leading to these breaks and extending as far above as could be seen from the crest. We were informed by a man who resides near by, that prior to the breaks in the brush work, the water above the dam presented the appearance of a lake, being nearly still, and the accumulation of sediment apparently even the whole way across. The dam from one end to the other, including the mattresses below, where not covered too deep with sand, is now a dense growth of willow, except at the breaks. This willow growth has sprouted from the logs and brush of which the dam is composed, and presents the appearance of a green ridge, extending from one bank of the river to the other, and is from three to four ft. in hight. New roots are thus forming, and the entire structure will soon become formidable from this new growth, and indestructible to any action of floods, and by slowing the water, if the old breaks are repaired, will stop the sediment and cause a building up and raising of the crest of the dam to quite an extent without artificial means. This is as Capt. Eads and the engineers stated would be the case, and but for the untoward circumstances which caused the breaks, the dam would now be growing into an indestructible barrier the entire distance between the high lands upon either side of the river.

Confidence in the Dam.

Colonel Mendell and his assistant were highly pleased with the portions of the dam which remain intact, and are extremely anxious to have the breaks repaired, being entirely confident that by so doing the experience of another winter will demonstrate that the original opinion of the engineers, that these structures could be made to perform the office for which they were intended, was correct. So confident is Colonel Mendell upon this point, that should the Drainage Act he declared by the Supreme Court to be unconstitutional, he would, if he had Government money at his disposal, repair these dams at once to prove their success.

At the Bear River dam they found two breaks. One near the north end is from 300 to 400 ft. long, and the other is about 100 ft. long and near the south end. Between those two breaks are settles in three or four places. This dam is also found to be growing a thick mat of young willows the entire length, except at the breaks. My impressions are that not so much sand and gravel deposit has been made in this dam as on the other river, but a very large amount is to be seen above, and is filled in to considerable depth.

THE hoisting works on the lower shaft of the Grand Prize mine are being moved to the Navajo.

New Hydrocarbon Furnace.

It is nothing new in hydrocarbon furnaces to employ a series of pockets filled with a mass of refractory material saturated with the oil, which pockets alternate with air chambers which receive air at the bottom and discharge it at the top, where it combines with the gases evolved to effect combustion.

An Eastern inventor, however, has got up a hydrocarbon furnace having the bottom of its combustion chambers made with a series of longitudinal pockets containing asbestos or analogous absorbent material, with perforated oil pipes imbedded therein, and with alternating air chambers arising between said pockets and communicating below with the portion of the furnace corresponding to the ash pit. The said air chambers being perforated at the top and surmounted by inclined hoods or sheds which deflect the currents of air down upon the surface of the saturated asbestos.

The advantage of these hoods is said to be that having their sides or wings extending obliquely down into the asbestos pockets, and deflecting the air-currents down upon the surfaces of the asbestos, they contribute to the intimate mingling of the gases and produce a more active combustion. These hoods, also, by covering the perforations on the top of the air chambers prevent them from becoming stopped up. A successful hydrocarbon furnace will be a valuable thing.

The Brush Dams.

In another column we give the results of the examination by the engineers, of the brush dams across the Yuba and Bear rivers, for impounding the debris. As will be seen, they express themselves as satisfied with the result of these preliminary trials of the brush dam system.

Before the dams were built the State Engineer had cross-section lines run across the river every 2,000 ft. for three and a half miles above, and marked by stakes and bank marks on each side of the river, so that the amount of filling which should take place could be accurately ascertained. Surveyors are now employed upon both sides of the river reviewing these cross-section lines, which will furnish accurate information upon the subject when the surveys and deductions are completed.

One of the Commission was asked the question as to whether in case the injunction suits now pending, or others which may be brought, should stop the hydraulic mining, would it be thought necessary to then make repairs to the debris dams which your Commission have built?

The answer to this was as follows:

The necessity for repairing these dams does not in any manner depend upon the success or failure of the suits against miners. The amount of debris now in the rivers and canyons above the dams renders it the part of wisdom to keep it out of the navigable rivers, or they will be destroyed, even if no further mining should be done. Persons who have not examined the subject have but little idea of the danger from this source. The amount lodged in the canyons and rivers above these dams is simply enormous, being in one place, to my knowledge, not less than 150 ft. in depth. Of course this is an exception, but the amount is very great, and even if the mining should cease now, this deposit would keep working down into the rivers and valleys, producing great damage. These dams are needed to hold back the debris now in the rivers and canyons, and it will be a profitable investment to add the small amount that it will now cost to make them effective and successful. In case the mining should be stopped the dams will not only prevent the debris above from being brought down, but will also, by doing this, keep the water from being loaded with heavy material, and enable it to scour out and carry away the deposits in the beds of the rivers below. These dams, therefore, should be repaired and preserved, whether hydraulic mining is stopped by the courts or not.

Mining Rulings.

Where a vein or lode of mineral is discovered upon lands entered under agricultural laws but previous to issuance of patent, such vein or lode, with surface ground, may be located under the mining laws and relinquished and segregated from the agricultural entry previously allowed. It will not be necessary to relinquish the entire legal subdivision upon which such mineral location has been made unless subsequent development and discoveries, before issuance of agricultural patent, demonstrate that such subdivision is more valuable for mineral than agricultural purposes.

No specific amount of annual expenditures upon land located in good faith for milling or mining purposes. The performance of the annual labor of the required value upon a lode claim is sufficient for the purpose of retaining possessory right to a mill site located in connection with said claim.

Applicants for mineral patents are required to establish their citizenship either by their affidavit sworn to before an officer authorized to administer oath within the district where entry is made, or by the affidavit of disinterested person before a proper officer anywhere.

Hurdy-Gurdy Water-Wheels.

[Written for the PRESS by LUTHER WAGONER, C. E.]

Notee upon the Measurement of Power Developed by a Hurdy-Gurdy Water-Wheel.

The data here given was taken Jnnnary, 1880, at tbe quartz mill of J. H. Malone, of Mariposa, Cal. The object in view was to determine the proper speed of the wheel and to measure the avnilnble power. Tbe wheel has a vertical axis, and is 40$\frac{3}{4}$ ft. in diameter, or 128 ft. girth through center of huckets. A beveled spur and pinion of $\frac{1}{4}\frac{3}{8}$ teeth transmite motion to n horizontal shaft having npon it a cast-iron pulley 36 inches diamoter und 16 inches fnce. The wheel hne 16 arme 2x6 inches, aod a board, 1x8 ioches, is bent around the wheel and secured hy holts at the joints. The huckets, 32 in number, are nailed to the outside of the rim-bosrd. They nre 8 inchee high hy 2$\frac{3}{4}$ inches wide where the water strikes nt n right nngle or taogentially to the wheel. Short boards were afterward added to the buckets to better retnin the water. The accompsnying sketch (Fig. 2) will show the general arrnngement of the wheel and buckets.

The water was conveyed in n pipe from the ditch, 560 ft. of 10-inch aod 350 ft. of 7-inch, and delivered through n "ginnt" having a 1$\frac{1}{2}$-inch nozzle of the nsual form used in hydrsulicing; taking the friction of the water in the pipe, equal to a hend of 5.6 ft., from the actual head of 155 ft., the effective head is 149.4 ft., and the velncity of the wnter issning from the nozzle will be $\sqrt{149.6 \times 8.03} = 98.2$, and takiog the coefficient of discharge for the nozzle at .98, the actual velocity of the water issuiog from the nozzle will he 96.04, or, in round numbers, 96 ft. per seoond, or 5,760 ft. per minute. To measure the power transmitted to the wheel a friction brake like that shown in Fig. 3 was used.

A wooden lever, turniog npon an iron holt 1$\frac{1}{4}$ inches diameter, was placed under the cast-iron pulley, and at the end, *A*, a hole was made in the lever vertically under the rim of the pulley and a olevis inserted; a rope 1$\frac{1}{2}$ inches diameter wss fastened to the clevis and carried over the pulley, and a weight-hox, *W*, made fast to the free end of the rope.

The distance, *F B*, was made 3 5 times that of *A F*, for the pulley having a circumference of 9.42 ft., the horse power will equal load at *B* multiplied hy nnmher of turns of pulley per minute, divided by 1,000; hence *F B* is to *A F* as $\frac{3300}{9.42 \times 1000}$ is to 1.

Tnis was done to simplify calculations while experimenting. A steel yard was euspended over the end, *B*, so as to weigh the etrain; a guide was added to prevent too mnch oscillation of the steel yard. When the hrake was first applied, the dry rope acting npon the slightly rusted surface caused considerable jerking, hut afcer it had worn smooth and was lightly tallowed, it ran remarkably steady, a 6-penny nail in the weight-hox being eufficient to "break" the scale.

The machine heing in operation and under a full head of water, gave the following results:

Firet Experiment.

Revolutions of water-wheel per minnte, 17.4; revolutions of pnlley, per minute, 52.9; reading of steel yard, 104 lbs.; and $\frac{104 \times 52.9}{1000} = 5.5$ horse power = 181,600 foot-pounds of availahle power.

Second Experiment.

The hrake was removed from the pulley, and the revolutions increased as follows: Revolutions of water-wheel per minute, 26.2; revolutione of pulley per minute, 79.3. Hence it nppears that friction of machinery and resistance of the air have ahsorhed all of the work at this speed.

Third Experiment.

A spring halance was applied to the center of the huckets, and the wheel pulled slowly around. The average reading gave 7.16 lbs., and $7.16 \times 128 = 916$ foot-pounds ahsorhed by friction for one revolution of the wheel.

The force with which the water strikes the wheel ie that due to the difference of velocity of the wheel and the water; this force multiplied hy velocity of wheel will represent the work.

The velocity of the water, 5,760 ft. per minute, divided hy the girth of wheel, 128 ft., gives 45 revolutions aa the theoretical speed. The relntive amonnt of work for N turns per minute is (45 – N) N.

For the first experiment, this gives (45 – 17.4) 17.4 = 480. For the second experiment, this gives (45 – 26.2) 26.2 = 493. Of the power transmitted to the wheel, one portion is ahsorhed as friction nf the machinery; another portion in overcoming the resistance of the air, and the remainder appears as availahle work. As the resistance of the air increases as the equare of the velocity, the work ahsorhed will increase as the cube. The friction of the machinery increases dlrectly ae tbe velocity. Putting X equal to the foot-pounds ahsorhed at one revolntion per minute of the water-wheel, the following eqnations can he formed: $17.4^2 X + 17.4 \times 916 + 181,600 = W = 5.068X + 197,440$ = (Eq. 1). $26.2^2 X + 26.2 \times 916 = W = 17,986 X + 24,000$ = (Eq. 2). To make equality hetween the equations, the first mnst he multiplied hy $\frac{17986}{17563} = 1.026$, from which X is found equal to 14.11 foot-pounds. Substituting this value of X in equation (1), $5,268 \times 14.11 = 74,330$ F P, lost by resistance of the air against the wheel.

The total power developed is:

Friction of machinery	15,940 F. P.
Resistance of the air	74,330 "
Availahle work on the brake	181,500 "
Total work developed	271,770 F. P.

The power developed at N revolutions is K (45 – N) N. To find K, make it equal to $\frac{271,770}{(45 - 17.4)\,17.4} = 565.9$.

The availahle work for N revolutions will he in foot-pounds: $W = 566 (45 - N) N - 14.11 N^3 - 916 N$, this expanded, is $25,470 N - 566 N^2 - 14.11 N^3 - 916 N$; and to find the mnximnm value of W, its first differential co-efficient mads equal to zero is $42.33 N^2 + 1,132 N = 24,554$, and N = 13 34. Substituting this value in the finsl eqnation, the following qnantities are found:

Friction of machinery	12,220 foot-pounds
Resistance of the air	33,500 "
Availahle work	193 330 "
Total	239,050 foot-pounds

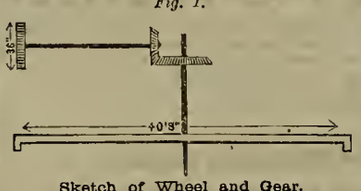
The watsr conenmed in one minnte is 70.6 cobic feet, or 4,390 lbs., and $149.4 \times 4,390 = 657,900$ foot-pounds. The available work, 193,330, divided hy 657,900, gives 29.4% as the maximum useful effect of the wheel. By reducing it to a proper size, so as to dimioish resistance of the air, and also, to admit of higher speed, ahout 40% conld he obtained.

A Curious Ore Separator.

A mnn named Sanders, in Philadelphia, hae invented a separator for ore which is of rather cnrious constructioo. He hne a vertical cylinder in which is a vertical shaft, this shaft extending only half way down, and hearing on a central post in the cylinder. On the shaft are hladee or paddlee, two or more in number.

The hottom of the cylinder below the shaft is

Fig. 1.

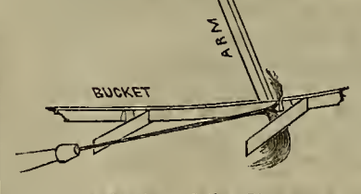


Sketch of Wheel and Gear.

divided into compartments hy means of radial partitions, the nnmher of the partitione depending upon the nnmher of snhstances to he separated. The partitions are arranged to he movahle in order that the nnmher of compartments can he regulated. A hopper is placed above into which the ore can he poured.

The cylinder ie filled with water, and hy snitable mechanism the shaft is revolved with

Fig. 2.



A Section of the Rim.

its paddles at a uniform velocity. This rotation causes the water to revolve. Then the material to he separated is fed through the hopper. Previous to feeding, the material is hrought to a uniform size by screening.

The material, when it strikes the rotatiug liquid, will fall through it in a descending spiral. The pieces having the greatest specific gravity will descend at the least angle from the perpendicular, conseqnently reaching the top of the partition nearer to the vertical from the hopper than the piecee which have less specific gravity. The position of the hopper is so arranged that the descending piecee will divide properly at one of the partitions.

After the separated materials have reached the top line of the partition they will descend to the hottom, and may he removed from the compartments hy opcninge at their hottome.

CALIFORNIA PIONEERS.—At the annual election of the Society of California Pioneers, the following officers were elected: Pres., Joseph G. Eastland; Vice-Pres'ts., John F. Lohse, of San Francisco, Ethelhert Burke, of San Francisco, Lansing B. Mizner, of Benicia, Charles Harrison, of Oakland, and Thomas H. Laine, of San Jose; Sec'y, Ferdinand Vassanlt; Treas., Howard Havens; Marshal, William Huefner. Directors, Washington Bartlett, Geo. B. Bradford, Joseph Britton, George S. Evans, John G. Hodge, S. W. Holladay, F. W. Macondry, Samuel P. Middleton, Jamee Phelan. The Territorial Pioneers of California have elected the following officers: Pree., William T. Garratt; 1st Vice-Pres., William Pearson; 2d Vice-Pres., Matt. D. Carr; Sec'y, Lowell J. Hardy, Jr.; Treas., Robert Dinsmore; Marshal, Robert Bell. Directors, Capt. C. Nelson, John W. McCormick, Sol. D. Brastow, J. W. Wesson, Samuel Figel, Domingo Marcucci, Dallas A. Kneass, C. H. Reynolds, Ely I. Hntchinson, Jr., Benjamin B. Stanshnry and David Stern.

A Promising Mine.

EDS. PRESS:—The annexed report on a mine in Tulsre county is addressed to us hy a well-known mining man of considerahle experience in mining and mill matters in this State. We agree with him that it is earnestly to be desired that California capitalists shall aid in the development of mines in this State; hut, as our correspondent intimates in his commnnication, there seems to he an infatnstion to seod capital to distant localities, such ae Alaska, where it takes the riek of elemental strife, or to invest in Mexico, where Apache raids endanger property, rather than seek for legitimate mining hnsiness nearer home.

While capitaliste are seeking investments in Arizona, Mexico, Alaska, Idaho, etc., maoy promising mining regions in Cnlifornia have remained nnexplored. Recently, however, a company was formed in San Francisco, called the "Delano G. & S. M. Co.," composed of prominent oitizens of San Francisco, who have expended considerahle money in sinking and providing necessary machinery to sink shafts, etc., and partially develop their mine.

Comfortahle housee have heen erected for the accommodation of minere, and the necessary structures for carpenter and blacksmith-shope, etc. The locality has great advantages, heing in Tnlare county, ahout 26 miles north of east of Delano, a etation on the S. P. R. R., ahout 12 hours travel from Snn Francisco. The roads leading to and from the mine in all directions are exceptionally good. Wood is ahundant and cheap. Average tahle snpplies are purchased lower than in San Francisco. The climate ie delightful.

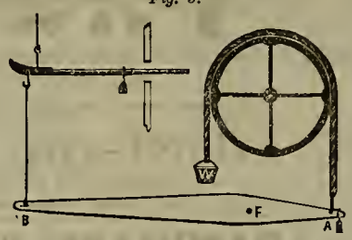
Adjoiniog the Delano are extensions north and south, in which several leading merchants in San Francisco are interested, and who are only awaiting developments in the Delano to put up works and develop their claims. Active operations are in contemplation on these extensions. Originally an incline was sunk on the ledge to a depth of 43 ft., showing the presence of ore the entire distance, varying in width from 4 inches to 18 inches.

A vertical shaft was afterward snnk to the west of the ledge to a depth of 75 ft., when a crosscut was run east and to the ledge (18 ft.), when drifts were rnn north and south, on the vein, aggregating 45 ft., aod were only diecontinued for the purpose of concentrating the lahor at the etraight shaft; the extremes of the drifte showing the same character and quality of ore as is exposed in the incline.

In the meantime, the incline was sunk to a depth of 75 ft. from the surface, showing an unmistakable ledge formation, carrying quartz the entire distance.

The extent of the ore body, laterally, has never

Fig. 3.



heen determined, as only 45 ft. (in the drifts) have ever heen explored, hut the samples have been assayed and show that they sre as rich as in the upper drift.

The ledge matter is ahout four ft. wide, *i. e.*, clay, decomposed quartz and rich paying quartz. In other words, cbaracteristic of all permanent, valuable ledges.

The inclination of the ledge in the incline for the firet 43 ft. is ahout 45 degrees, the deeper the incline, less the inclination. The quality of quartz is of unusual richness, assays varying from $36 to $915.

By continning the present levels north and south, and assuming that the ledge continues for 60 ft. farther in a lateral course, a large amount of quartz can be extracted from such levels to the surface.

The shaft has heen sunk 105 ft., and has cut the ledge vertically, which exhihits very rich ore, the vein widening.

Possihly the tendency of the ore to the south at this point may make it necessnry to run a drift a few feet to encounter the same quality of quartz as exists 25 ft. ahove.

Up to the present time all work done has heen essentially "dead work," so called in mining parlance. The mine is now in a condition, however, to extract ore from and ascertain the extent and character of its depoeits.

No difficulties are encountered in mining, as the mine has ample machinery, pumps, etc., to keep it dry and extract ore at minimum figuree. The ledge matter is soft and yielding, and rapid progress can he made in drifting and stoping. By making connection hetween the incline and drift, the facilities for working would be still furtber increased. The distance is hut a few feet. Contemplated as a mine of encouraging promise and prospective value, it certainly poeseeses great importance.

THE Butte (Montana) *Miner* appears in an enlarged and much improved form. The rapid growth of Butte as a rising nnd prosperous mining center hae called for corresponding growth of the *Miner*.

A Gift to the University.

The following letter from D. O. Mills Esq., who has just resigned ns a member of the Bonrd of Regents of the University of California, explains itself:

SAN FRANCISCO, July 7, 1881.

To the Board of Regents of the University of California:

GENTLEMEN—My interest in the institution over which you preside, and a desire to contribute to the benefit and support of good learning, prompt me to propose to you the establishing of a permauent fonndation in the natnre of a trnst fnnd, of which the income shall he applied to the maintensnce, in the University of California, of a Professorship of Intellectusl and Moral Philosophy and Civil Polity. The sole condition that I ehall impose npon thie trnst and foundation is that the income only shall he devoted exclusively to the support of thie professorship, and that any surplus shall be added to the origioal fund. While I propose to commit this trust to the keeping of the Regeuts of the University, confiding in their wisdom to direct it to the promotion of the studies to which it is dedicated, and to the steady increase of human thought and progress, and wonld limit it hy no narrow boundaries of transient opinion, I desire to record my viewe ae to tbe nnture of thie professorship, and the character of the man who ehould he called npon to discharge its duties.

The studies included nnder the general title pertain especially to msn—his intellectnal moral and social heing—and can never cease to hold a high place in human learning, nor to have great influence on human welfare. In the widest and most liheral meaning they underlie lawe, manners and religion, and in effect form the pnhlic opinion of the world, and their teacher ehonld not he one who merely resorte to them, picks them np, or incidentally adopts them, hnt one of philosophic spirit who shall devote his life to this appropriate field of influence and nohle lahor. To snch a man this professorship offere opportunities limited only hy hie own genine and devotion. For the above pnrpose I inclose herewith my check for the sum of $75,000, and will he ohliged if the Board will signify to me the acceptance of the trust. Hoping that thie may result to the advantage of the State and to the University, I remain, gentlemen, very respectfully,

D. O. MILLS.

This gift comes at an opportune time in tbe affaire of the University, and its friends will feel grateful to Mr. Mills, hoth for his generosity and his timely application of it. On receipt of the gift, the Regents passed nppropriate resolutions, one of which was as follows: That in recognition of the living interest and hroad viewe of the donor, the Professorship thus endowed ehall bear the name and title of the Mill Professorship of Intellectual and Moral Philosophy and Civil Polity, and that the wishes of Mr. Mills shall he consulted in the appointment of the first Professor.

Ore Concentration.

Messrs. Alvinza Hayward and Wm. T. Hobart are about to erect a 40-stamp mill on the Pacific mine at Plymouth, Amador county, adjoining the well-known Empire mine. They have ordered of Adams & Carter 16 Frue concentrators to go with their mills. Messrs. Hayward and Hohart were decidedly prejudiced in favor of the huddle, as they had thoroughly tested that system of concentration snd perfected it at the Empire mill, which they formerly controlled. This strong prejudice was overcome finally, after careful examination of the Frue concentrators, which these well-known and careful mining men now use instead of the buddle.

Four of these concentrators are going to the Fresno Enterprise mill, a new 10-stamp mill at Fresno Flat in that county.

Two have also gone to South Mountain, Idaho, for the Varkuff Mining, Smelting and Milling Co., a New York organization. This company is composed of New York capitalists and Utah lead smelters. They propose to work up the galena ores in South Mountain, near Silver City, Idaho. That section of the country contains a great deal of mineral wealth, hut heretofore it has not been very successfully worked, owing to the low grade of the ores. It is to he hoped that the new system of concentration, hy Frne machines, will help the miners out.

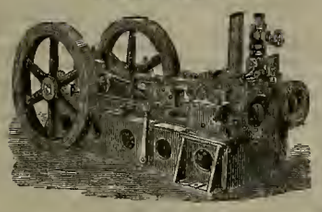
There is no question hut that in many districts on this coast, systems of concentration must he adopted before the ores can he profitably worked. There are many localities where the low grade of the ores prevents the construction of mills for working them. If, however, it can he possihle to concentrate these ores to douhle the richness, at half the cost of what the milling of an equal quality would he, then the ores can often he made to pay.

We have not until of late given any attention of moment to the matter of ore concentration. Now we are finding out that it pays to get rid of a lot of worthless gangue hefore treating the ores further.

This has been proven thoroughly in other sections. In places where ores are to be shipped, methods of concentration can always he profitably employed. Ten or 15 tons of ore can he reduced to one, and thie one shipped. In other conntries this is done more than it is here; hut we are fast learning economies in mining which experience has taught older communities.

INGERSOLL ROCK DRILL.

PRICES REDUCED.



Parties requiring Drills can get them at agents' rates by applying to

GEO. R. FOARD,

Sole Agent for Pacific Coast.

No. 18 First St., S. F.

The only Depot where Standard Drills and Duplicate Parts can be obtained.

WHEELOCK AUTOMATIC CUT-OFF ENGINE

INDORSED BY THE MOST EMINENT ENGINEERS OF THE COUNTRY AS THE MOST ECONOMICAL AND PERFECT WORKING ENGINE NOW MADE AND THE BEST PIECE OF STEAM MACHINERY THE MECHANICAL INGENUITY OF THE TIMES HAS YET PRODUCED. CAN BE SEEN IN OPERATION AT THE PACIFIC IRON WORKS, RANKIN, BRAYTON & CO., SAN FRANCISCO. SEND FOR CIRCULAR.

DODGE ROCK BREAKER

Challenges the World

To produce as good and cheap a Machine. Rock Breaker and Cornish Rolls combined in one Machine. Pulverizers, to Granulate Ores, for Roasting, Chloridizing, Leaching and Concentrating.

Concentrating Machinery!

Mining Machinery supplied.

San Francisco Cordage Factory.

Established 1856.

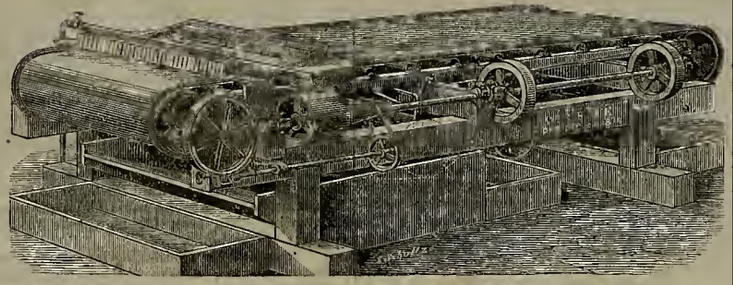
Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

TUBBS & CO.,

611 and 613 Front Street, San Francisco

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Over 250 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and the concentrations are clean from the first working.

The wear and tear are merely nominal; the water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

ADAMS & CARTER, Agents, Room 7, No. 109 California Street, S. F.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,

SAN FRANCISCO, CAL.

Excelsior Blasting Powder,

—MANUFACTURED BY—

THE EXCELSIOR POWDER COMPANY.

This is no NEW PATENT NON-EXPLOSIVE SAFETY POWDER, but the GENUINE STANDARD ARTICLE, and as safe to use and handle as any Nitro-Glycerine Powder manufactured. The Fumes and Gases, common in other Nitro-Glycerine Powders, are almost destroyed, and do not leave the miner with headache or nausea. Among the numerous recent testimonials the following is but a fair sample, constantly received, attesting the superiority of EXCELSIOR POWDER:

AUBURN, Cal., May 26, 1881.—EXCELSIOR POWDER CO.: I send you, per Wells, Fargo & Co., a box containing samples of country rock through which I am running our tunnel on the Conrad Mine, and through which we have now run 425 feet, 2.5 feet of it having been done with EXCELSIOR POWDER. If any one can produce harder rock I would like to see it. I here say that I can do more execution with your No. 2 Powder in this rock than I can with any No. 1 Powder of any manufacture I have ever used, and I have used every kind now manufactured here, excepting "Tonite," and I have had 20 years' experience in blasting. Respectfully yours,

E. W. ROBERTS, Superintendent.

Give this Powder a trial and you will use no other. For Strength and freedom from noxious fumes, it has no equal. Address all orders to EXCELSIOR POWDER CO., No. 330 Pine Street, Rooms 53 and 54, Academy Building, San Francisco, Cal.

VULCAN BLASTING POWDER.

—THE MOST ECONOMICAL AND BEST—

Nitro-Glycerine Explosive in the Market.

In the suit of the Ciant Powder Co. against the Vulcan Powder Co. for *alleged* infringement of Patent, it was held that the Ciant Powder Patent was INVALID.

Nos. 1, 2 and 3 Vulcan,

Each grade superior to like numbers of any other Nitro-Glycerine Powder in the market.

VULCAN B. B.,

Superior to Black, Judson or any low grade Powder for Bank Blasts, Railroad work, or any work where Black Powder has been herctofore employed.

TRIPLE FORCE CAPS AND ALL ORADES OF FUSE.

The CONSUMER'S COMPANY sell the best Powder at the lowest rates.

Office—218 California St., San Francisco.

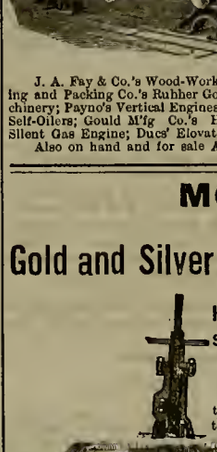
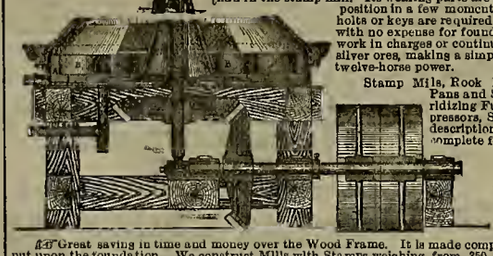
Also on hand and for sale A FULL LINE OF MILL AND MINING SUPPLIES.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.



Stamp Mils, Rook Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!
PATENTS REISSUED 1868.
The "OLD RELIABLE" with improvements, making it
THE MOST PERFECT TURBINE NOW IN USE.
Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.
Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

SHINGLE MACHINES AND SAW MILL MACHINERY, STEAM ENGINES, ETC., TO ORDER. MINING MACHINERY OF ALL KINDS.
F. A. HUNTINGTON,
220 Fremont Street, San Francisco.

DuBOIS' Automatic Quicksilver Feeder.
A machine for feeding quicksilver to the mortars of GOLD MILLS. It is so connected to the cam shaft, that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a mechanical movement, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding ordinary hand-feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect. Price complete, $100.00. Send for circular.
P. C. DuBOIS,
18 Fremont St., S. F.

ST. DAVID'S.
A FIRST-CLASS LODGING HOUSE
CONTAINS 118 ROOMS.
716 Howard St., near Third, San Francieco.
This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the Interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from $2.50 upward s
R. HUGHES, Proprietor.
At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.

FOR THE WEEK ENDING JULY 5, 1881.

243,700.—VENTILATOR—W. T. Cottier, Napa, Cal.
243,801.—MAGAZINE FIRE ARM—A. Schneider, S. F.
243,814.—STEAM PUMPING ENGINE—Thompson & Evans, S. F.
243,818.—CORSET—Mrs. C. V. Nicola Valley, B. C.
243,715.—COMBINED HEADER AND THRESHER, A. H. Lightlhall, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

MAGAZINE FIRE-ARM.—Alois Schneider, 24 Erie street, S. F. Dated July 5, 1881. No. 243,801. Mr. Schneider's invention relates to certain improvements in these fire-arms which have a magazine for containing a series of cartridges in line; and it consists in a means of preventing the cartridges within the magazine from reeting upon one another, whereby the daoger of explosion may be avoided. The invention is applied to any form of magazine in which the cartridges lie in line, one above another, as in the ordinary form. Mr. Schneider has made several valuable improvements in fire-arms, being an inventor of great skill and ingenuity in this line, and a mechanical expert as well. Amoog other things, he has patented an excellent method of converting muzzle-loading rifles into breech loaders by simple means.

LUBRICATOR FOR CYLINDERS OF AIR COMPRESSORS.—R. F. Grigsby, Rosario, Mexico. Dated July 5, 1881. No. 243,773. This invention is fully described in another columo of this number.

CORSET.—Christiana V. Turner, Nicola valley, British Columbia. Dated July 5, 1881. No. 243,818. The invention relates to that class of corsets, the novelty in which consists in a peculiar construction of sections, cut in shape and form of particular dimensions, said sections, when united, forming a corset which will exactly fit the wearer, and which, by reason of its construction, will especially fit the hips better, and render a better support for the back than corsets, as ordinarily made. Having the general shapes of the sections, any appropriate system of measurement may be applied to make the corset fit different bodies.

VENTILATOR.—Wm. T. Cottier, Napa. Dated July 5, 1881. No. 243,760. The object of this invention is to provide a means of ventilation for chimneys, vaults, water closets, rooms, buildings, urinals, cars, ships, sewers, or any places where impure air or foul gases are liable to generate. It consists in providing a chimney, tube or shaft with supplemental induction tubes, the openings of which communicate with peculiarly formed air-concentrators, by which the currents of air are directed into the said induction tubes, inside the chimney stack or tube, without the use of movable directors, whatever be the direction of the wind. The currents of air entering these induction tubes, and passing upward, tend to draw up, by induction, the gases or foul air below and ventilate the space or chamber with which the chimney flue or tube is connected. This space the inventor calls the vomitorium and it is adapted to receive the foul air from the sower, room or other place to be ventilated and deliver it into the flue.

MORE NEW MINES.—Saye the *Silver State:* Some very promising mines are being discovered along the Idaho road, in the vicinity of Willow creek. The French boye, according to all reports, have found a large ledge on Rock creek, south of Willow creek, and Chas. Siekron hae discovered a very valuable mine, about eight milee northeast of Willow Creek station. The ledge, which crops out nearly the whole length of the claim—1,500 ft.—is from three to eix ft. wide on the surface. The discoverere have run a drift 40 ft. on the vein, and have taken out about 20 tone of good ore. The ledge has been named the Comstock, becauee the ore resembles that of the great mine of that name in Virginia City. There is plenty of water and timber near the mine, at the head of the south fork of Flat creek.

IDAHO YIELD AND DIVIDEND.—The yield of the Idaho mine for the month of June wae $56,000. The usual dividend of $7.50 per ehare, amounting to $23,250, has been declared and paid. This makee the 143d regular dividend paid hy the company, amounting iu the aggregate to $2,985,300, out of a total product of a little above $6,500,000.

VOLCANO, Amador, hae ehipped over $20,000,000 in gold since 1849.

The Industrial Fair.

A full meeting of the Board of Managere of the Mecbanics' Inetitute fair was held on Tueeday evening laet. It was reported to the meeting that all the main floor-epace of the entire pavilion has already been applied for and awarded, and the aeeurance ie now perfect that this department of the great exhibition will be far more inclueive and complete than at any preceding fair. Ae it has been determined that the coming exhibition ehall eurpase all preceding ones, so it hae aleo been determined that the fitting of the pavilion ehall correepond with such increaeed excellence. All the preeent decorations, many of which have become entirely too familiar, are to be removed, and new, artistic and coetly decorations are to be eubetituted. The eeaeon checke and the tickete of admiseion to the exposition are to be printed at once, and will be immediately put upon eale at varione convenient places throughout the city. The garden and the grasees and flowere will, perhaps, show a more radical excellence over preceding yeere than even the exhibite on the main floor. More floriete have applied for epace than ever before, and each applicant will make a fuller and more varioue ehowing than any exhihitor hae yet done. A epecialty thie year in thie department will be of tropical trees and plante and of the treee and plante of the eemitropical Southern California.

It hae heen decided that the art gallery of the Expoeition ehell be a new and deeirable departure from this department, ae heretofore managed. The details were reeerved for decieion at the next meeting, bnt it is already certain that the art exhibit will be a complete exhibition of itself. Both the Mieeion and the Market-street entrances to the Pavilion are to be kept upen for the accommodation of vieitore. The fair will be opened on the night of Tueeday, the 2d of Auguet next.

News in Brief.

THE Tombstone mines produced in Jnne $529,000.

IN a financial point of view, Griscom's fast at Chicago hae proved a failure.

THERE are eome 200 men employed on the Nevada and Oregon railroad.

BATTLE MOUNTAIN'S arteeian wells are making that vicinity a garden epot.

WORK hae been reeumed to complete the new Mint refinery building at Careon.

THE run of ealmon ie increasing at Aetoria. The run in Frazer river hegan July 10th.

During the week ending the 8th inet 23 deathe from yellow fever occurred in Havana.

THE firet locomotive for the California Southrailroad has arrived at San Diego per the brig *Orient.*

A CHUNK of eolid gold, weighing $65.75 was picked up last week in the Ward mine Trinity county.

THE country above Cloverdale is filled with campers from San Francieco, Oakland and other lowland placee.

THE machinery for the new rolling mille at the railroad ehope in Sacramento is rapidly approaching completion.

THE California Hosiery Company, Oakland, now employe abont 220 hande, and is kept hnsy filling ordere for Uncle Sam.

AN effort will be made to bridge the Sacramento river at Chico this fall, or as early in the coming spring as practicable.

THERE are millione of catfieh and perch now in Washoe lake, but they will not he fit for table uee until a year from this time.

THE London eeaeon has thue far been uneually quiet. Kelakana, King of the Sandwich Islands, ie the fashionahle lion and goee everywhere.

ENGINEERS are making eurveye for fortificatione at Victoria and Esquimalt. The Imperial government intends to make Eequimalt barbor impregnahle.

SIR SAMUEL and Lady Baker are vieiting Webber lake and vicinity. They are famoue travelere, and have been in almoet every country of the habitable globe.

ACCORDING to the aseeesment roll the total value of all property, real and pereonal, in Tulare county, ie $7,845,610, being an increase of $1,307,822 eince last year.

MYERS, of the Manhattan Athletic Clnh of New York, rao a quarter-mile raoe at Birmingham, Eng., Satnrday, in 49 eeconde, beating the Englieh recorde and his own.

A TRACT of 120,000 acres of land in San Bernardino county has just been purchaeed by a capitalist, and ie now being out up into emall farms and put on the market.

MILLIONS of saw-loge are being rafted, and tbousande of railroad tiee are being loaded for ehipment up the Columbia river from Cowlitz county, Waehington Territory.

THE body of T. K. Pugh, eon of ex-Senator Pugh, who wae made captive recently in Chihuahua by Apaches, bae been fonnd horribly mutilated, and hearing evidence of torture before death.

THE Russian Minister of War proposee to diecontinue the construction of fortificatione on the German and Auetrian frontiere, begun by his predeceeeor, eaving 10,000,000 rubles in the budget.

THE *Bee* eaye there ie a Chinese firm in Sacramento engaged in packing and shipping frnit and vegetables to the interior. It employe eome white boye in the bneinees, and is paying them good wages.

TONITE.—The Grase Valley *Union*, speaking of the recent explosion of powder at Tucson, which was at firet attributed to Tonite, until it was found there were seven kinds of powder in one room, and a lot of caps in the other, there being but two roome in the buildings, saye: "Ae to Tonite powder being an effective and eafe exploeive, it may be etated that it has been (in connection with black powder) in general uee in the Idaho mine of thie district, since about the firet nf laet January, and has given eatisfaction in every reepect. It etande in high favor witb the Superintendent of the mine and all of the workmen. No accident has occurred from its use, and the general regularity of ite effects and efficiency demonstrate that it undergobe no chemical changee that render it uncertain or nnsafe. Like the dynamite powdere it emits fumee upon exploeion that are disagreeable in a cloee drift but theee paee off readily in a few minntes, so that no unpleasant effects are prodnced npon the workmen. Mining men understand that the Idaho is one of the moet extensively worked minee in the State, employing a large force of men, and that if the Tonite powder ie a dangerous exploeive ite nee in the hands of eo many persons would have before thie time shown its bad or treaoheroue qualitiee, and the Superintendent, Mr. Coleman, now considers himeelf justified in regarding it as among the most valuable explosivee, and without depreciating thoee that are aleo in general uee, gives it the preference. It cennot be eaid of the Tonite that it is behind the age. In fact it ie up witb the times. It ie extensively used in England. Ie almoet exclueively ueed by that government for torpedoes in the naval eervice, and ite consumption ie largely on the increase throughout all the mining regions of the Pacific coaet."

ASKING FOR A REDUCTION.—All the hydraulic mining companiee in Nevada county have petitioned the Board of Supervisore for a reduction of their aseeeemente to the amount of 66⅔%. The applicatione are made on acconnt of injunctions in force and threatened by which the mining properties will he greatly depreoiated in value. The Supervieore will give full hearing and concideration to theee applicatione before taking action. The reduction asked for, if allowed, will make a very conoiderahle deorease in the aggregate assesement of the county.

THE Denver & Rio Grande are reported to have ordered a hundred locomotives for the Utah divieion of their line.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and ecience, by aselsting Agents in their labors of canvassing, by lending their influcuce and encouraging favors. We intond to send none but worthy men.

J. F. OSBORNE—San Francieco.
A. C. KNOX—Napa and Lake coantics.
O. W. MCCABE—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Yuba and Sutter countiee.
D. W. KELLEHER—Solano and Sacramento countlee.
ORO. W. FAHRION—Plumas county.
GEO H. HOPKINS—Amador county.
A. LEONARD MEYER—Utali and Idabo Ter.

IMPORTANT additione are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions ie increased and there is a better chance to study their actions. The pavilion has new varietiee of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardene is a day well epent.

PERSONS receiving a eample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and cousider fairly its claims for support, and if consistent, subscribe for the paper tbrough the P. M. or agent delivering it, or otherwise. We will send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do eo.

ANDERSON SPRINGS, in Lake county, 19 milee from Calistoga (over a grand, picturesque route, via Mt. St. Helena) are among the best in this State. They are situated in the midst of a natural park, full of beauty and interest to the naturalist. Good home-like accommodatione at reasonable rates are invariably furnisbed by the Andereon family.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the eubecriber wante it etopped. So be sure and send us notice by *letter.*

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

THE State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francieco.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F.D., at this office.

DEWEY & CO.'S
Scientific Press **Patent Agency.**
[ESTABLISHED 1860.]
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

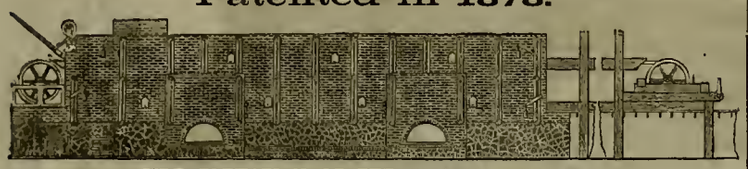
THE O'HARRA
CHLORIDIZING FURNACE.
Patented in 1878.



SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

—o—

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1 10 per ton to work 40 tons in 24 hours.

At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61½.

Lewis Chalmers, of the Isabella C. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenual sulphurate of silver up to from 84% to 95% of the assay.

VOLUME XLIII Number 4.

Foundry Notes.

Large Pumping Engines.

At a recent visit to the machine works of Messrs. Goss & Adams, 114 and 116 Beale St., we witnessed the starting up and trial of one of a pair of enormous direct acting plunger pumps, built by this firm, (and of which they make a specialty), for the new California Sugar Refinery, now being erected by Messrs. Spreckels on the Potrero. The pattern was devised by Mr. Geo. E. Dow, constructing engineer of the firm, who has secured through the MINING AND SCIENTIFIC PRESS Patent Agency several patents upon this pump, so it is purely a home production. The pair of pumps weigh 50 tons, a statement which will give an idea of their great size, and they are among the largest ever constructed in this city. They stand each 17 ft. 6 inches high, and 26 ft. 6 inches long.

The dimensions are as follows: Diameter of steam cylinders, 30 inches; diameter of plungers, 26 inches; length of stroke, 36 inches. The combined capacity of the pumps is 8,000 gallons a minute at a hight of 100 ft., or nearly 500,000 gallons per hour. They are intended to be used for cooling and condensing purposes at the sugar refinery, pumping salt water from the bay. The pair of pumps is set on a very solid foundation in the basement of the building, their suction pipes leading to a reservoir or well connected by a bricked tunnel with the bay. The flow of water is controlled by suitable valves or gates, arranged so that they can be easily lifted at any time, even with a heavy pressure on one side. A very complete series of screens for preventing the entrance of fish, dirt, etc., has been arranged by Mr. Watson, the superintendent of construction at the refinery, who, also devised the form of gate controlling the flow of water.

Aside from the direct improvements introduced on these pumps by Mr. Dow, the general design shows a proper consideration of proportion and detail, simplicity and accessibility to all working parts being prominent.

The engines are operated with Dow's latest improved valve motion, which controls the motion of the piston completely, being perfectly free from the concussive action, and controlling the length of stroke to a nicety. The performance of the pumps under the variable test to which they are subjected reflects credit on both builder and designer, and was perfectly satisfactory to the purchaser.

The pumps are mounted on substantial bed plates, which also serve as receiving chambers for the water, to which are connected 24-inch mains. The plungers are jointly connected to a central crosshead, and extend into chambers through external packing glands, separated sufficiently to receive slide frames, upon which rests the crosshead sustaining the plungers. As the weight of the plungers is relieved from the sleeves and packing and carried upon independent adjustable bearings (without interfering with the elements of flotation), the friction is materially reduced, as the packing space can be maintained perfectly concentric. We shall shortly present engravings showing the details of construction of this new form of pumps.

Golden State and Miners' Iron Works.

At these works they are very busy early and late on a large amount of small work for the country. Have just finished a new clam-shell dredging apparatus, which has been put at work in Oakland creek, removing the mud to the cars on the wharf from the scows into which it has been put by another machine. A similar machine is being made for work up at Humboldt bay. A great deal of work is being done for narrow gauge cars, such as boxes, storehouses, oil cups, and all the iron work, except axles and wheels. This work is being done for Carter Bros., at Newark, who are exceedingly busy on this class of work, building narrow gauge cars as fast as it is possible to be done. They have built and are building a lot for Mexico. These are shipped to Guaymas, where they are set up.

The works are doing a good deal of white iron work for Idaho quartz mills. They are also doing considerable for the Presidio Railway Co. in this city, among other things making 24-ft. pulleys for the cable. They have a lathe there, arranged so they can turn off 30-ft. pulleys. The Golden State and Miners' usually do most of the quicksilver mining work, but there is very little being done in that line now. They are making suction blowers for the Great Western mine, but that is about all.

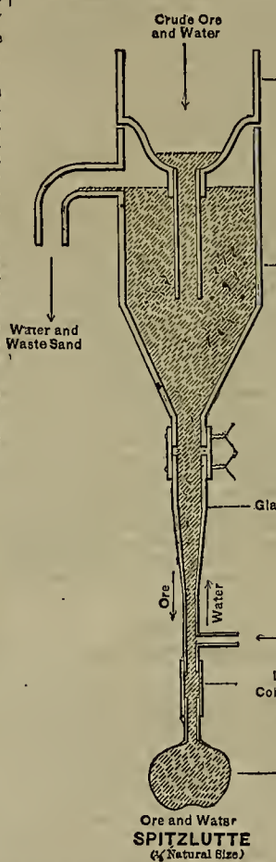
Notes on the Assay Spitzlutte.

Robt. H. Richards, S. B., Professor of Mining, read recently, before the American Institute of Mining Engineers, a description of an assay spitzlutte from the mining laboratory of the Massachusetts Institute of Technology. Prof. Richards says:

The spitzlutte, as described by Rittinger, is an instrument by which sand is sorted in a continual upward-flowing stream of water. Its usual form is that of a pointed box, placed with the point downward, the box receiving its feed of sand and water on one side, and discharging its tailings on the other. The assorted product or concentration is discharged at the bottom, at the apex of the box, through which it falls against an upward current of water, which current serves to effect the assorting and separation. To make this exposure to the quicksand condition still more effective, an inverted dam is placed across the spitzlutte, which forces the sand in its passage from the feed side to the discharge, to pass down into the more active portion of the upward-flowing current of water.

In the form adopted for small tests in the mining laboratory of the Massachusetts Institute of Technology (see accompanying sketch) the feed is through a central funnel instead of being at the side, and the apex of this funnel, extending down nearly to the apex of the cone, takes the place of the inverted dam in the large spitzlutte. To keep the experiment perfectly under control a bulb or bottle is attached by a rubber connecting-tube to receive the concentrations, and between this bottle and the apex of the spitzlutte is placed a glass tube of conical form, with a side tube for the admission of water. By regulating the admission of water through this tube the concentration may be allowed to go down into the bulb as fast or as slowly as the richness of the ore seems to demand.

JIG WITH GLASS SIDES
(½ Natural Size)



SPITZLUTTE
(½ Natural Size)

AN ASSAY SPITZLUTTE FOR MINING LABORATORIES.

This spitzlutte may be used on products that have been previously sized to take out the heavy mineral. As an example of this, a test was made upon a sample of ore where the galena, blende, and quartz were much mixed up, but separated perfectly when crushed. The sample of ore was from Newhnryport, and assayed 16.50% lead. After sizing through a series of sieves the ore yielded concentrations and tailings to the spitzlutte as follows:

Through. On.	Concentrations, Lead.	Middlings, Lead.	Tailings, Lead.
12 — 20	47.28%	11.38%	2.48%
20 — 30	47.81%		1.67%
30 — 40	48 61%		2.56%
40 — 50	51 93%		3.54%
50 — 90	50.95%		1.18%
90 —	31.93%		Not worked

Again this spitzlutte can be used on natural products. By these I mean products that have been crushed simply without being subjected to the usual process of sizing by a series of sieves. In this case its overflow sand must be re-treated by the miner's pan or sichertrog to extract the finer portion of the ore. It makes a very good preliminary to the miner's pan, taking out the largest grains, which interfere with the pan's best action, leaving the finer grains of ore for the pan to finish.

The spitzlutte has been used by us mainly to separate mercury and amalgam from pulp after amalgamating tests. For this purpose it is very efficient. It is also used to gain an approximate idea of how an ore will concentrate, and how fine it should be crushed in order to concentrate it to the best advantage on the large scale.

The little jig (shown in the accompanying sketch) used as a lecture experiment and as a test of larger machines, is 6 inches deep, 4 inches long and 3 inches wide, with plate glass sides, wooden ends, and a sieve bottom of 30 meshes to the inch.

This jig will show very perfect lines of separation between quartz, specific gravity 2.6, blende, specific gravity 4, and galena, specific gravity 7.5. It will show a partial separation between blende, specific gravity 4, and magnetite, specific gravity 5.1.

The separation of red marble, white barite and blue galena is very marked, and makes a good lecture experiment.

In using this jig to test the running of larger machines it simply shows with what ease or difficulty a given set of layers may be obtained.

In the vicinity of Milford and Beaver, the people are full of talk about the proposed southward extension of the Consolidated Utah Central railroad. According to the rumors there, the plan is to extend the Utah road to a connection with the Southern Pacific at some point in Arizona nearest the Utah line.

Academy of Sciences.

The regular monthly meeting of the Academy of Sciences was held last Monday evening, Pres. Davidson in the chair. John Richards, of the S. F. Tool Co., a mechanical engineer, was elected a member, and the applications for membership of David Cohn, Captain Charles Nelson and F. M. Whitlaw were referred to the Committee on Membership. Contributions to the museum were received as follows: From John A. Palmer, of Carlin, Nev., arrow-heads of Shoshone Indians, and a plant used by them for food; from Jerome Gay, a broken spear-head from Strawberry valley, Mt. Shasta; from Mrs. F. M. Pixley, an arrow-head found in a mound near San Rafael; from James Say, of Nevada, three arrow-points and two spear-heads of the Pahute Indians; E. R. Shimmin, a hanging nest of a titmouse; from H. M. Newhall, a skeleton of a cat; from R. W. Simpson, a piece of rock found on the north bank of the Columbia river; from Prof. Davidson, 23 photographs of natives of Easter island; from Josiah Kemp, A. M., curator of conchology, common sea shells of California; from H. C. Russell, Government Astronomer of New South Wales, results of observations made at the Sydney Observatory during 1877 and 1878; from Lieut. Frederick Schwatka, U. S. N., paper on ice navigation read before the United States Naval Institute.

From J. G. Crocker, Bakersfield, a rock crystal, petrified knot of wood, petrified peach, and petrified brain taken from the skull of a bullock; from Mrs. J. G. Lemmon, small piece of coal found at a depth of 80 ft. in an old tunnel, at the month of which is an oak tree 1½ ft. in diameter, petrified balsam from a dead fir tree in the Sierra Nevada mountains, virgin copper from a mine in Santa Rita mountains, Arizona, and silver ore from Davis mine, Patagonia mountains; from Dr. W. H. Harkness, magnesite carbonate of magnesia; from A. Weekes, fossil wood, lava and serpentine from Giant Gap gravel mine; from J. W. Wilder, a piece of black shale found in an artesian well near the Presidio, 70 ft. from the surface; from Jerome Fay, of Siskiyou county, a volcanic glass, and from James Say a quartz crystal and moss agate.

Judge Abram Fornander, of Honolulu, presented the second volume of his recent work on the Philology and Anthropology of the Pacific islands.

Dr. C. C. Parry, of the United States Bureau of Forestry, read a paper comparing plants found on Cerros island, on the coast of Lower California, with different varieties of California plants.

Prof. Davidson made some remarks concerning the comet, which we give more at length in another column.

Notice was given that at the next meeting Mr. John Richards will read a paper on "The application of standard measures to industrial pursuits."

AMONG the gifts to the library at the last meeting of the Academy of Sciences, was a large geological map in sheets of New South Wales, by the Government Geologist, in colors similar to maps published by the United States Survey of the 40th parallel. Accompanying this was a statement of the quantity and value of minerals raised in New South Wales prior to January 1st, 1880, with approximate areas of the mineral deposits and the formations in which they occur. These being of great general interest to California, the values of the following varieties of minerals included in the above enumeration are here given: Gold, £33,335,800; silver, £143,501; coal, £11,036,722; shale, petroleum oil and cannel coal, £495,574; tin, £3,144,237; copper, £2,494,437; iron, £54,151; antimony, £10,178; lead, £2,510. Total mineral product of New South Wales up to January 1, 1880, amounted to the gross sum of £50,717,110.

THE assay value of the output of the Ontario mine, Utah, for June, was $235,141, making the total gross yield of the mine to date, $8,486,653. The 68 consecutive dividend (65 of them $50,000, and three of $75,000 each) was paid June 15th.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Amador County Mines.

EDITORS PRESS:—Since my last lsttsr I have resnmed my tramp. Arriving at the Bunker Hill mill, I found quite an extensive change had taken nlace since my last visit. The mill has heen enlarged and improvsd hsyond recognitiou to an old ssttler—in fact, it is a new mill with the exception of 10 stamps and a few Hendy concsntrators, which constituted the old one. The present mill in its finished condition has one rock-hreaker (self-feeders), 40 stamps, a numhsr of Hendy concentrators, and eight Frue tahles of the latest pattern. I am informed that the lattsr concentrator does excellent work with proper care. The pulp from the Hendy concentors is delivered to a conceutrator patented hy Dr. Blatchley from San Francisco, which appears to he simple of construction and dnrahle. If its merits are as good as represented, it will supersede all other concentrators in view of its advantages of first cost and after repaire when in nse. I find a numher of water-wheels lying around the premises. It seems to me it mnst have heen quite a honanza to a foundry to cast so many one after another. And finally, I am told, after experimenting with quite a number of pressure wheele of different patterns with no satisfactory results, the management on the score of economy were ohliged to put one in of home production, choosing Knight's patent, which gives the hest resnlts so far. From the mill I visited the

New Chlorination Works,

Worked under the Mears patent, a revolving furnace for roasting. And hy the hy, I am told this mechanical fornace is not a succcss for roasting gold sulphurets. As a matter of fact, in this establishment, they were compelled to roaet their first batch of 100 tons or so over a second time. At first grand resnlte were promised; so far it is quite the reverse. I fail to see any improvement over the usual method of working eulphurets heretofore in use in thie county, and onr quartz mine owners look with a great deal of suspicion npon the innovations.

At the north shaft I find a new hut very frail gallows frame, and a small double hoist. Present depth of shaft, about 400 ft.; eouth shaft, no improvements to date—the same old hoisting rig. It seems to me if the mine ie ae good as represented, why not put up good and suhstantial hoisting works? It has heen the universal custom heretofore in this county to do all improvements on the surface for the time heing only, uot thinking how often renewal bas to take place on account of increased depth and the improvements in crushing of mills.

Well, grand results are expected from this property. Its present owners are confident of its future succees. I trust they will he fully rewarded for the vast amount of money expended within the last 12 months. Adjoining the Bunker Hill comes the

Original Amador.

Now lying idle after draining its stockholders in England without limit. Indeed, it eeems to me that English capital always goes amiss in our county. Thie property was disposed of hy misrepresentation for an enormous sum. Since the purchase a very large snm of money has been expended in exploring the mine with hopes of regaining some small mite of the capital invested, hut so far with no satisfactory results; in fact I hear the mine is shut down for good, and some of the mill machinery is heing removed. A company that has expendcd eo much money, and that very liberally, deservee better. The next mine of importance is the

Famous Keystone,

One of the most profitable properties in this State, without any exception. The very looks around thie mine bear an air of prosperity. Mill has hcen lately rehuilt under the enperintendency of that master of mechanics, Mr. Lepley, who, hy the hy, ie an inventive genius of great merit. In fact, his handiwork is to he seen on every hand around the mine and mill. Such a man ie of incalculahle value to such a company as this. Mill has 40 etamps, self-feeders, rock hreaker, an ore hin that will hold 3,000 tons in reserve in case of accident in mine. Hendy concentratore giving satisfactory results. Save some 45 to 50 tons of sulphurets per mouth, worked at the Amador reduction works of Sutter Creek. Sulphurets yield ahout $130 to $150 per ton ot 2,000 lbs. Ore averages from $10 to $15 per ton, occasionally going higher. This company contemplates some extensive improvements this season—a new fire-proof office, one of the hest hoisting works in the State, also a sulphuret reduction works. Bricks have heen manufactured for this purpose, and I believe work will he soon started.

Next to the Keystone comes the South Spring Hill Quartz mine, a..nply prospecting with encouraging prospects; and farther south is a mine which was at one time famons for rich rock, hut for eome time has heen idlo, with no proepect of starting up soon.

The Comet Mine

Has reverted to its former owner. Depth of shaft, 180 ft. Prospects, discouraging. Adjoining this claim R. C. Downs has just started to prospect. It is a piece of mining property recsntly hought, having heen idls for a numher of years. From surface indications, and also the history of the north and south extsnsions it is not a very desirahle property to have at the present time. However, it will reqnire some depth to prove its valne. Lincoln mine has been idle since the lsase expired. It has not hesn worked hy the company proper for the last four years; present depth of mine, 800 ft. Outside appsarancss are very disconraging for it sver resuming work. Top of shaft and hoisting works settling out of shape; gallows frame ready to fall down, and a few caves here and there show clearly that the foreign stockholders have had enough of this pie. It is only one more instance of how they were deceived. I helieve the foreign stockholders in this mine ars Scotch.

The Mahoney

Has just started its new pump, which does not, so far, give entire satisfaction. The intention is to go down to the 800-ft. levsl. Present appearance of surface seems to me as if the mine had heen hadly managed, settling and caving in all directions. This company have had their legal difficulties for eome time and the end is not yet. It is whispered around that the present management are trying to make a sale. In fact all goes to prove it. The mine to-day does not pay its present expenses, nor has it for some years. A good chance for a *foreign investment*.

Wildeman Mine

Has heen idle for some time. At present it has a lawsnit to contend with, tbat most likely will keep it in snspenee for some time longer.

The Cou. Amador is sinking; present depth of shaft about 800 ft. The last fire has put a damper on the futnre prospect of this property. It ie the intention of the present stockholders to sink the shaft to a depth, of 1,000 ft. If not satisfactory at that depth will suspend for an indefinite length of time.

Oneida mine has taken down everything. It is evidently shut down for good after an expenditnre of eome hundreds of tbonsande of dollars hy different parties, and a very great deal has heen expended very foolishly.

You will observe some of our representative mines are not looking very well and eome ahandoned for good; etill there is a fair prospect of some other properties taking their place in the near future.

Cooney mine, situated one mile eouth of Jackson, is running in full blast. It has one of the finest and most expensive mills in the State—40 stamps, rock hreaker, etc.—but for some reason it does not do the work. Sixteen Frue concentrators eave some 2½ to 3 tons per day of snlphurets that work up to from $90 to $100 per ton. The company have one of the fineet reduction works in the county. No expense epared on any improvements around thie mine. It is well that Dr. Zeile has a long purse.

I will give you more particnlars in a future letter ahout this property and others. I have endeavored to give yon the truth without any coloring, ae I am one of a great many who believe that these rose-colored reports are of more harm than good to any mining district. A mine that will not hear close inspection is not worth having.

QUARTZ MINER.

Sutter Creek, July, 1881.

Expenditures on Claims.

The following circular has jnst heen promulgated hy the Commissioner of tbe General Land Office, explaining and interpreting the act to amend sections 2,324 and 2,325 of the Revised Statutes of the United Statee, concerning mineral lands, approved Jannary 22, 1880:

The first section of this act has reference only to the affidavits mentioned in section 2,325 of the Revised Statutes. It is therefore held that it has no reference to the manner of estahlishing proof of citizenship. An applicant for a mining patent who resides in the land district in which the mine is located, if within the district at the time the application is made, must take the required affidavits. If he is not so within the district, the affidavits may be made by a duly appointed agent conversant with the facts.

It is held, under the eecond section of the act, that lahor performed or money expended upon a mining claim prior to the 1st day of January eucceeding the date of location thereof, will not be considered as a partof, or applied upon, the first annual expeuditure required hy law. Thus, upon a claim located at any time during the year 1880, the period within which the labor must he performed commences January 1, 1881, and during the calendar year 1881 the expenditure must bs made, or the claim will he subject to re-location on and after Jannary 1, 1882.

In order to apply the law to a claim located prior to the year 1880, it will he necessary to calculate from the date of locatiou. For instance, a claim located in 1875, the first expeditnre would he reckoned as due within the year from January 1, 1876, to wit: January 1, 1877, and annually thereafter by the calendar year.

WORK ON MILLING OR MINING LANDS.—The department decides that no specific amount of annual expenditnree is required npon lands located in good faith for milling or mining purpoes. The performance of the amount of lahor of the required value upon a lode claim is eufficient for the purpose of retaining possessory right to a mill-site located in counection with the claim.

Notes on Irrigation.—No. 2.

I will as briefly as possihle call your attention to the Mokelumne valley and the adjacent country lying betwesn Dry creek on the north and Mormon slough on the south (an area of 150,000 acres), so far as one system of drainage and irrigation can be applied. The Mokelumns river takes its rise in the high Sierras to the east of ns, where is stored the annual prodnct of snow and ice, to be melted by the sun of summer and sent down in perennial streams througb precipitous and rocky canons of wildest graudenr to the thirsty plains hslow.

The elevation of the Mokelnmne at Hermit valley as stated by Prof. Whitney, State Geologist, is 7,259 ft. ahove sea level. The snow is said to accumulate there in the winter to great depths, owing to its great slevation and sheltered position, with high mountains on all sides.

Like most of our large mountain streams, it flows in a deeply eroded channsl, and where it dehonches from the foothills, lies in a trough 50 or 30 ft. below the level of the plain, until at Woodhridge, in flood-time, much of the stream overflows its hanks and spreads through varions drainage channels over the plains. Below Woodhridge the river takes a northwestern sweep of 35 miles (or 15 miles in a direct line when it divides, making the north and south fork, and emhracing in its sinuous folds Staten island, a body of swamp and overflowed land, with an area of 10,000 acres). The river again rennites and runs four milee, when it finally debouches into the San Joaquin. At the head of tide water navigation, near Mokelumne City, or near New Hope, the waters of the Cosumnes and Dry Creek nnite with the Mokelumne. The cachement or drainage area of these three streams combined, amounts to 1,372 miles—that of the Mokelumne alone heing 573 square miles.

The mean discharge of the Mokelumne in average seasons, during the months of May, June and July is, approximately, 4,500 cubic ft. per second—sufficient to irrigate 225,000 acres under a duty of 50 acres per cubic ft. per second; or 450,000 acres under a duty of 100 acres per cubic ft. per second; or 675,000 acres under a duty of 150 acres per cubic ft. per second; or 1,350,000 acres under a duty of 300 acree per cubic ft. per second, as Prof. Davidson thinks might he reached, considering our soil as applied to cereals. You will see, therefore, that if we wish to go into the irrigation business on a grand scale, and spread ourselves, we have abnndant resonrces of one of the most important essentiale, so far as water snpply is concerned. (Prohahly the water that ran to waste last season reached ten times the amount above indicated.)

Duty of Water.

I have just used the term "duty" per cubic ft. of water. By this we mean the qnantity reqnired to irrigats a superficial area of land of standard dimensions; as, for instance, an acre; or hy the statement of an area of land effectually irrigated by the use of a definite volume of water, delivered at a uniform rate through a certain period of time—the irrigating season. Thue, in the case of a etream which delivers water at the rate of five cnbic ft. per second through the season, and accomplishes the irrigation of 500 acree of land, we say that the water performs a duty of 100 acree per second ft., meaning that each ft. per second, continuously flowing through the esason, irrigatee 100 acres of land. This expression is, of course, in terms of the extent in acreage, performed hy a etandard volume of water—the cuhic ft. per second of continnous flow for the season. (Halls.)

Bnt the quantity of water required may he variahle, according to the character of the soil and the crops to he cultivated; cereals requiring the least, and hoed crope the most. Although the Calaveras river has a cachement area of 390 square miles, it doee not head high enough in the monntains to he perennial in its flow.

The forke of the Mokelumne and Stanislans on either eide lap around and ahove tho Calaveras, whose main supply is the raine of winter. It has, therefore, little value as a stream for irrigation. The Mormon slough fork bas heen utilized for that purpose, I helieve, to a limited extent.

I have referred to the Mokelumne as a stream having ahnndant aqueous supplies if properly distrihuted, for all the irrigahle lande in San Joaquin county, with a large surplus for eeveral other total ahstinence communities.

But from the topography of the country hefore referred to, it cannot he taken out as cheaply as the waters of some other rivers, and we are ohliged to go up into the foothills and hring it along the hillsides until we can place it upon the crust of the plain at a satisfactory elevation for transmission to the desired points. To reach all the lands snsceptihle of being irrigated from this source, the water should he taken out as high up as the site of the old Wade & Arson hridge, jnst northwest of Campo Seco, thence to be transmittsd in a canal the distance of eight miles to Bear creek; one hranch thence to the crest of the plaine to reach a drainage channel, Paddy's creek, I helieve, where it will intersect the Calaveras at or near Bellota. This hranch will irrigate the county east of Stockton.

To construct this main supply channel of 8 miles there are no engineering difficulties to be encountered, no expeneive rock cnts of moment; hut 2 or 3 gulches to epan by aqueducts or cross by pipes, and tbe soil generally, at the propsr season, is easily worked. In tbe case of the Mokelumne Ditch and Irrigation Co., it was estimatsd that a section of canal of this length, sufficient to irrigate 50,000 acrss, could he constructed for $20,000, sxclusive of dam and headworks. Reaching Bear cresk, we ntilize that channel as a main trunk for the snpply of suhordinate ditches that will place water upon all the lands lying hetwsen the Mokclumne and Calaveras.

New Use for Miner's Ditches.

And here I wish to remark that the era of gold mining has left its rich heritage of mining ditches that cost the hnildsrs hundreds of thousands of dollars, and having to a great extent served their purpose, may now he utilizsd for agricultural purposes for a small per cent. of their original cost. Of this character is the Davis ditch that cost $130,000, that takes its water from Italian bar, nortb of Campo Seco, and transmitted it along ths slopes snd crests of hills to Lancha Plana, Wintsrs' bar, Poverty har and Mike's gulch, soutbeast of the Poland houss.

This ditch has a capacity for irrigating about 30,000 acres, and at any time in the futnre may he enlarged to any required size. The lower portion—that west of Comanche is not now in use, hut I am told may he restored for ahont $1,000 and water put into Bear creek within one month. The entire ditch now in good working order, with the reservoirs, pipes and appurtances cau he purchased for $20,000. An outlay of $5,000 or $6,000 will douhle its capacity.

Bear creek is the main drainage channel for the section of country lying hetween the Mokelumne and Calaveras rivers. Ite length from where it forms a junction with the proposed canal is ahout 20 miles, and terminates in Fourteen-mile slough, a tidal afluent of the San Joaquin river.

It is proposed to utilize this as the main eupply trunk. Where it intersecte the canal the width is 35 ft., hut soon increases in size ae it receives the drainage of numerous afluents which make their way from the plains, until in the lowlands, the embankments made to confine the waters from spreading over the country in the rainy season, are 100 to 150 ft apart. The higbt of the banks is from four to six ft.

For the first two miles the fall is 11.1 ft. per mile, then averages seven to five ft. per mile. The total fall is 170 ft., or an average of about nine ft. per mile. With thie excessive fall, giving a current from six to four miles per hour, the stahilty of the channel would be greatly endangered were it not from the fact that the underlying strata along the upper part of the liues ie of lava rock, or sandstone, merging on the plains into indurated sand or hardpan, of sufficient compactness to resist the ordinary erosion of water. Bear creek forks at a point half a mile soutb of the Poland house, and this hranch may he continned along the south side of the Lockeford road, thence westerly following the crest of the Mokelumne, on the township line down past Woodhridge to the head of Sycamore slough on land of Sargent Bros.

Another fork occurs near Harmony Grove school-house, and at Brannock's old place on the Cherokee lane road, takes the name of Brannock's slongb. This finally spreads upon the plains, hut the lower end is now emhanked, however, so as to confine ite waters, and they fall into White's slough in the S. & O. lande.

Between the Calaveras and the Mokelumne.

You will ece, therefore, that in a system of irrigation worke for this section Bear creek will occupy a very important position, as it will serve as a supply canal for most of the plain lands hetween the Mokelumne and Calaveras.

Snh-ditchee can he taken thence hy tbe farmer to he applied to his lands, the topographic slope heing such that water will reach all parts of it.

A hranch canal could be taken out of Bear creek jnst east of Lockeford and carried south so as to intersect Thomas slough, which it would partly follow, and be dropped into the Calaveras Irrigation Co.'s canal, near Tone's hridge and thence carried 14 miles, where it intersects Bear creek near the Five-mile honse, lower Sacramento road. There are numeroue other drainage channels in the dietrict which may he utilized to transmit water, or for the purpose of drainage.

The area that may he reached by the system of irrigation ahove outlined, embracee about 150,000 acres. Of this amonnt 95,500 acres lie hetween the Mokelumne and Calaveras. What portion of this area is likely to he irrigated at any one time is a question. Referring to the irrigation districts of Europe, we find that ahout one-half the numher of acres within a district, received the direct application of water. In India, one-third. Allowance must he made for roads, towns, and building sites, woodlands, pastures and lands lying fallow.

SQUAW CREEK.—From Mr. J. R. Murphy, who was in Challis a few days ago, we learn that the great ore chimney in the Saturday mine, continues down as depth is obtained in the workings. He does not claim that the ore is of high grade; hut upon a calculation of cost of reduction, in comparison with that at Eureka, he claims that they can he worked with as great profit as at that place. In the handling of smelting ores, charcoal is an important item; and this commodity costs an average of 30 cents per hushel at Eureka, while iu onr camp it can he delivered for a trifle over balf that price.—*Challis Messenger.*

MECHANICAL PROGRESS.

Pickling Castings.

The action of acids on castings just from the mold is not always understood, and when haste is required in preparing castings for manipulation time is wasted unnecessarily. The acids attack the metal—iron, brass or bronze—and not the envelope of burned sand or the skin of oxide. The acids get under these and lift them from the metallic surface by a chemical process similar to that we understand as fomentation, a combination of the acids with the oxygen of the atmosphere and the oxygen of the metals. By rapid fomentation the scale and sand are loosened and easily removed by washing and the use of wire brushes. The silicate of the sand is melted by the intense heat of the fused metal and forms a solid coat under the loosely adhering sand of the mold, and under that is the pyrogenous oxide of the metal itself, neither of which are readily attacked by the acid.

The acid attacks only the metal, and this should be exposed to its action in order to facilitate the cleansing process. A few blows with the penn of a hammer at short distances apart disintegrates the enveloping crust and allows the acid to enter to the surface of the metal. Once in, it works its way under the scale and loosens all the foreign matter from the metal.

The usual course of merely jarring off the loose sand by a rap on the casting as raised from the mold, does not give sufficient ingress to the acid and the air; the better way is to have a man give a few sharp raps with a hammer pean along the face of the casting or by an instrument composed of three steel plates hardened, set on a square shank, and held by a nut, the shank terminating in a handle. Such an instrument will keep its edges sufficiently sharp until worn up to near the handle, and is very effectual in breaking through the molding sand and the brittle oxide and allowing the acid to act rapidly. Blows from three to six inches apart are sufficient for the purpose of hastening the action of the acid. Castings so treated can be pickled in a few minutes, or an hour at most, and will come out so free that a slight brushing with the wire brush and rinsing in water will leave them ready for the lathe, planer or vise.—*Boston Journal of Commerce.*

WET PEAT FOR STEAM-FUEL.—A correspondent of the Boston *Journal of Commerce* writes as follows: "Having had two years' experience with the Jarvis furnace setting I would say, as far as my experience has gone, I find it second to none; having used peat not more than two hours from its bed, saturated with water. The first time I really thought it impossible to burn, but I was soon convinced the other way. I found, after mixing one part of coal to three of peat, that one firing of the mixture lasted longer than an all-coal fire did. I also found that after the fire got well under way I got a far better result, for with an all-coal fire my water would remain still; in my compound, with a peat fire, I could fluctuate my water two inches in the glass. The result was astonishing to me as well as others. To overcome an addition of labor on my fireman, I had the peat brought into the boiler-house alongside the coal, so that the fireman, instead of mixing in the usual way, would shovel one of coal and three of peat. Furthermore, I would say we had a large sawmill in the yard, also a planing mill and box shop, which gave a large percentage of fuel in the line of sawdust, shavings and small blocks; the sawdust had been used for barn purposes, also for ice-house, and the remainder for filling in the lumber yard. I commenced to use up this after my boilers were set up with the Jarvis furnace. I was informed by some of the old settlers that some of the sawdust I was using had been there from 10 to 12 years, for I found it black with age. If some of the users of steam would give peat one trial, I would venture to say they would continue its use, providing they are not overcharged for it. I would guarantee them a good result and a cheap fuel."

HOLDING POWER OF STEAM TUBES.—In order to settle the question what is the holding power of tubes in steam boilers rolled by the Dudgeon tube expander, now so generally used by boiler makers, the Hartford Steam Boiler Inspection and Insurance Co. had a test made by Mr. C. B. Richards. H. B. Beach & Son, of Hartford, prepared three specimens composed of tubes three inches external diameter, rolled into ⅝ inch plate in the ordinary way, without any expanding other than that produced by the apparatus, without the projecting part being flared or beaded. It was, therefore, held by friction only. The tube end, where it passed through the plate, was increased in diameter by 0.1 inch by the expanding process. In two samples in which the plate was 15 32 of an inch thick the tube yielded at 4,500 and 7,000 lbs., while a third, in a ½-inch plate, yielded at a stress of 6,000 lbs.

STEEL BELTING.—A patent recently granted in Vienna and Berlin uses bands of steel, tempered and hardened, to transmit motion from one pulley to the other, the faces of the pulleys being turned perfectly flat and then faced with a varnish of rosin, shellac and asphalt. The fastenings of these belts are of a peculiar structure and cannot properly be described without engravings.

Artificial Seasoning of Timber.

A German piano manufacturer, Herr C. Rene, of Stettin, claims that the experience of a number of years has shown the superiority of a method of seasoning timber artificially, introduced by him. In his plan he makes use of the property of oxygen, particularly of that ozonized by the electric current, to artificially season the timber. The first impulse to experiments being carried out in this direction, was given by the well-known fact that wood which has been seasoned for years is much more suitable for the manufacture of musical instruments than if used soon after it is thoroughly dried only. Mr. Rene claims that instruments made of wood which has been treated by his oxygen process possess a remarkably fine tone, which not only does not decrease with age, but, so far as experience teaches, improves with age as does the tone of some famous old violins by Italian masters. We are further told that the sounding boards made of wood prepared in this manner have the quality of retaining the sound longer and more powerfully. A number of pianos manufactured at Mr. Rene's works and exported to the tropics several years ago, have stood exceedingly well, and seem in no way affected by the climatic dangers they are exposed to. While other methods of impregnating wood with chemicals generally have a deteriorating influence on the wood fibers, timber prepared by this method, which is really an artificial ageing, becomes harder and stronger. The process and the apparatus consists of a hermetically closed boiler or tank, in which the wood to be treated by the process is placed on iron gratings; in a retort placed by the side of the boiler and connected to it by a pipe with stop valve, oxygen is developed and admitted into the boiler through the valve. Provision is made in the boiler to ozonize the oxygen by means of an electric current, and the boiler is then gently fired and kept hot for 48 or 50 hours, after which time the process of preservation of wood is complete.

MALLEABLE CASTINGS. — Considerable pretense of mystery is assumed by manufacturers of malleable castings, both in this and the old country, and doubtless there are some trade secrets of value to those in the trade relative to mixtures of different irons, etc., but the process is in itself simple, and a little experience should enable any foundryman to attain a creditable success in it. The London *Ironmonger* says: "For the purpose of the casting, pig of a fine quality is needed, and great care is used in the preparation of the moulds, so that there may be no flaw or imperfection in the casting. The latter, after cooling, is, of course, hard and brittle, and it is to remove this brittleness and give it the character of malleable iron that the special process is required. The casting is now placed in hermetically sealed pots or boxes, surrounded by powdered ore, and subjected for several days to intense heat, which by cementation, gradually softens it and renders it malleable to the core, when it may be bent or wound into any shape."

NEW STEAM GENERATOR.—A French manufacturing firm, Messrs. Serpolet, have patented a peculiar method of generating steam. At each stroke of the piston of the engine a certain quantity of water is projected against two strongly heated metal plates. The steam so produced goes directly into the cylinder, so that in this arrangement not only a special generator, but also the valve system for the entering steam, is superfluous. In the example given in *Dingler's Journal* the vaporizing surface consists of two metallic cones, one within the other, with an interval of about 0.04 inch between. The hollow space is divided into two chambers, each of which is connected with one side of the cylinder. The gases play first on the inner surface of the double cone, then on the outer.

COMPARATIVE VALUE OF STEAM ENGINES.—Hallauer's recent experiments have led him to the conclusion that the difference between engines of one and two cylinders, in point of economy, is very slight. In ranging from 80 to 8,000 horse power, with revolutions varying from 25 to 90 per minute, the expenditure of steam for a given amount of work remains the same for the same type of motor; the consumptions for two cylinder motors are identical for Woolf and compound, whatever may be the volumes of the cylinders, provided the motors are regulated so as to give the maximum efficiency; the expenditures of steam in motors of one, two, and three cylinders, suitably regulated and constructed, are so nearly alike that the choice may be governed in each instance merely by the fitness of the type of the engine for the particular purpose desired.

AN improved furnace for locomotive and other steam boilers has been patented by John Alves, of Dunedin, New Zealand. The grate bars are set out from the tube sheet to leave an air passage between them, and a fire bridge is supported by the grate bars, and is provided with a vertical and inclined and horizontal slots and flange surmounting the air chamber.

HOW MADE.—Hollow steel shafting, which is gradually coming into use, is made by casting the metal round a core of lime, the ingot being finally rolled into shafting, the lime core going with it and diminishing in diameter in the same proportion as the metal, even when the total diameter is reduced as low as ¼ inch.

SCIENTIFIC PROGRESS.

Color Relations of Metals.

In a paper on the color relations of copper, nickel, cobalt, iron, manganese and chromium, read before the Chemical society, Mr. T. Bayley records some remarkable relations between solutions of these metals. It appears that iron, cobalt and copper form a natural color group, for if solutions of their sulphates are mixed together in the proportions of 20 parts of copper, eight of iron and six of cobalt, the resulting liquid is free from color, but is gray and partially opaque. It follows from this that a mixture of any two of these elements is complementary to the third, if the above proportions are maintained. Thus a solution of cobalt (pink) is complementary to a mixture of iron and copper (bluish green); a solution of iron (yellow) to a mixture of copper and cobalt (violet); and a solution of copper (blue) to a mixture of cobalt and iron (red). But, as Mr. Bayley shows, a solution of copper is exactly complementary to the red reflection from copper, and a polished plate of this metal viewed through a solution of copper salt of a certain thickness is silver-white. As a further consequence it follows that a mixture of iron (7 parts) and cobalt (6 parts) is identical in color with a plate of copper. The resemblance is so striking, that a silver or platinum vessel covered to a proper depth with such a solution, is indistinguishable from copper.

There is a curious fact regarding nickel, also worthy of attention. The metal forms solutions which can be exactly simulated by a mixture of iron and copper solutions; but this mixture contains more iron than that which is complementary to cobalt. Nickel solutions are almost complementary to cobalt solutions, but they transmit an excess of yellow light. Now the atomic weight of nickel is very nearly the mean of the atomic weight of iron and copper, but it is a little lower, that is, nearer to iron. There is thus a perfect analogy between the atomic weights and the color properties in this case. This analogy is even more general, for Mr. Bayley states that in the case of iron, cobalt and copper, the mean wave length of the light absorbed is proportional to the atomic weight. The specific chromatic power of the metal varies, being least for copper. The specific chromatic power increases with the affinity of the metal for oxygen. Chromium forms three kinds of salts—pink salts, identical in color with the cobalt salts; blue salts, identical in color with copper salts; and green salts, complementary to the red salts.

Manganese, in like manner, forms more than one kin of salt. The red salts of manganese are identical in color with the red cobalt salts and with the red chromium salts. The salts of chromium and manganese, according to the author, are with difficulty attainable in a state of chromatic purity. He thinks that these properties of the metals lead up to some very interesting considerations.—*Chemical Review.*

Rival Methods.

A good deal of attention is now given in New York to the different methods of producing the electric light. The *Times* says a serious objection to the use of the dynamic machine, used for the purpose of producing the light, is the fluctuation in the intensity of the blaze, due to causes which seem to be insurmountable. The use of steam power to generate electricity seems impossible from vibrations in the density of the light. But it is now claimed that by using batteries instead of dynamo-electric machines, a steady and non-varying light can be obtained. The claim which the *Times* speaks of seems pretty well established. The *Times* adds: "Batteries, or cells, as sources of power, ought to be less costly than the machines now in use, and their employment could be universally practicable where the machines would be beyond the reach of most people. If, in addition to the advantages of cheapness and availability, the electric light can be made perfectly steady in volume and luster, a great step will have been made toward securing a perfect artificial light.

PREHISTORIC FINDS.—While working the lead mines in the province of Segovia, some 70 miles west of Madrid, Spain, an immense cavern was found, containing, upon an argillaceous deposit and in the midst of stalagmites, 500 skeletons of men and women. Besides 10 well-shaped and perfect skulls of prehistoric type, there were chipped stone and quartz implements and fragments of rude pottery. In France, in the lower tertiary beds near Rheims—which were considered nearly, if not quite Azoic—Dr. Lemoine has discovered fossil remains of an extremely interesting fauna, comprising numerous new species, and even some new genera, of mammals, birds and reptiles. Many of these species exhibit characters intermediate between those of types which have been heretofore described.

A VIENNA chemist has succeeded in producing a new coloring matter on silk, which is a nice blue by day and a beautiful pink by artificial light. The alcoholic solution of this color is dark violet in a transparent, but red in direct light.

Inflammability by the Action of Nitric Acid.

It has long been a mooted question with scientists whether or not nitric acid is able to ignite vegetable matter. Instances have been known where such a result seems to have occurred; but most scientists have generally attributed the ignition to the presence of small quantities of some other substances than simply nitric acid and vegetable matter. A German chemist, named Kraut, some eight or 10 years since tried to prove that, by pouring nitric acid of 1.5, or fuming nitric acid of 1.62 specific gravity, on straw, sawdust or packing linen, the temperature could be raised to 55°, without causing the mixture to ignite, thus contradicting various statements that nitric acid was a dangerous article to ship. A similar statement was afterward made by the Naturalists' Convention, in Hamburg.

Quite recently, however, this same chemist has communicated to the Chemical Society at Berlin the fact that he has found out how to prove the inflammability of a mixture of nitric acid in connection with sawdust, straw, hay, cotton and shavings. He stated that he has made several trials of this fact, always with the same result. He about half fills a square wooden box with one of the above materials, puts a flask containing 25 to 100 cubic centimeters of nitric acid, of at least 1.5 specific gravity, upon it, and fills the box full of hay, straw, or the same material mentioned above; then, by some means, breaks the flask in the box, and puts a light cover over it. After one or two minutes, vapors are visible; some time after, a thick, white foam, resulting from the nitric acid, arises, which is followed by the smoke of the burning material. If the cover is taken off after five or ten minutes, the box is found to contain burning ocaly matter, which begins to flame up by contact with the air, and often also ignites the box itself. In other cases, the opening of the box was not necessary to cause the material to flame. With nitric acid of 1.45, Kraut did not succeed in bringing forth flames.

On the Substitution of Oleomagarine for Butter.

Professor Riche has read an article before the *Academie de Medecine* an official report of the commission appointed by the Minister of the Interior, to give an opinion as to the propriety of substituting oleomargarine for butter in the asylums for the insane, from which the following conclusions are drawn:

1st. It appears from three years' experience at St. Anne, at Vaucluse, and at Ville Evrard, that the employees and some patients could not endure this alteration in the usual fare.

2d. The alimentation, and therefore the preservation in health of extra sensitive and very delicate patients, would be unfavorably affected. In any case it would be a serious change in the regimen of those whose constitutions were already worn out.

3d. Oleomargarine is a manufactured product and so open to fraud; it is well known that vegetable oils are used. Moreover, experience shows that some time is required for a stomach accustomed to food cooked in fat to become habituated to that dressed in oil; and physiological researches prove that vegetable oils are less easily digested than animal fat.

4th. Fatty substances are only absorbed into the system in the state of emulsion. Chemical practice and culinary experience having shown that oleomargarine does not emulsionize so readily as butter, and that the emulsion of the former is not as stable as that of the latter, it is reasonable to conclude that oleomargarine is not so easily assimilated as butter.

It was therefore proposed that the commission should reply to the Minister that the *Academie* considered the proposed substitution inexpedient; and this proposition being put to vote, was unanimously approved.—*Moniteur de la Pharm.*

BLEACHING BY THE ELECTRIC LIGHT.—The proposition to stimulate the growth of plants at night by means of the electric light and thus insure their early maturity, was quite a surprise to the average agriculturist. And now M. Claude, a Frenchman, surprises the dyers by inventing and patenting an application of the same light to the bleaching of textiles and other substances. This he proposes to do by placing the light in a rectangular box, provided with a reflector, before which the yarn of cloth is moved slowly by means of rollers. He is indifferent as to whether the light is produced between points as in the Brush system, or by the incandescence of a thin band, as in that of Edison, but he seems to be unwilling to rely on it altogether. For he proposes to impregnate the fabric and the atmosphere of his bleaching chamber with the vapor of oil of turpentine, and he suggests the employment of the peroxide of hydrogen in order to complete the decoloriziug, an effect it would produce without the light.

PRESERVATION OF THE COLORS OF DRIED PLANTS.—According to M. Storbzl, the slow immersion of the fresh plant in a boiling solution of one part of salicylic acid in 600 parts of alcohol, and then shaking off superfluous moisture, previous to pressing in the usual way between blotting-paper, will more nearly preserve the natural color than any other method.

Of $6,288,585 paid in dividends by the principal dividend-paying mines of the country for the six months ending June 30th, the Ontario is credited with $350,000, and is the only Utah mine which figures in the list. But of course it is not the only one worked at a profit to its owners.

Capt. Burbridge, Superintendent of the old Dominion Copper Mining Co., says the Globe (A. T.) *Chronicle*, has left on a trip to San Francisco to order hoisting works for the company's property, and attend to the shipment of the two 36-ton smelters, which will soon be ready.

The miniug superintendents of Eureka have issued a pamphlet showing the great ore-producing record and capacity of their camp, in which they set forth that Eureka has two mines which alone have paid morc in dividends than all the dividend-paying mines of Colorado.

Reports of claims being jumped, come from Grapeville District, San Bernardino.

The Mining Share Market.

The stock market has heen a littlc bit excited this week over the Alhion lawsuit, and the Savage election. Otherwise, nothiug of interest has trauspired. On the Comstock, according to the *News*, the situation is encouraging for the Gold Hill group. Yellow Jacket has hut fairly commenced the work of prospecting. The strike made in its grounl by the south header of the Sutro tunnel is of great importance, and in days gone by all eyes would he attracted to that point and the stock would he the liveliest on the list, hut now there seems to be a serpent fascination for dealers at the north end which prevents them from glancing around or investing elsewhere. Crown Point and Belcher, too, are extracting no small amount of ore at the present time, and they have good indications of finding in their lower levels something hetter than the low-grade ore taken out above. The Kentuck has hnt recently heen started up, and is not uow iu a condition for active work, yet 10 tons of ore are daily taken from it, and quite a number of men are given employment. In fact, it is worthy of uote that more men are to-day given employment in the Gold Hill mines than at any time in the past two years and a half, and it is exceedingly prohahle that the nnmber will he increased before long. It is exnected that the Bullionville will he worked shortly; the snhstantial preparations made there would surely indicate as mnch, outside the assurance of the management that snch is to he the case.

More or less prospecting is uow carried on in the mines from the Hale & Norcross to the Sierra Nevada. Good air circnlation has heen secured in all the mines under Bonanza control, and drifts and crosscuts have heon, or will be shortly, started in every direction and pushed rapidly. Taking everything into consideration, the outlook is hy no means as dark as many would fain to helieve, and there will surely he fonnd a silver lining of prosperity to the present clond of depression.

Men who have millions in mines, and who have heen all over the Black Hills and seen everything in Utah, Colorado and Arizona, not long since told a Reno *Gazette* reporter that Eastern Nevada was the best mining country in Amcrica; that it was the most heavily mineralized, and had the hest ledges of any district yet discovcred. They say that the country is not half prospected and that they have every faith of a grand future. One of these gentlemen was J. C. Gilmer, the stage man, who is a good judge of such matters.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Silver King, July 11th, $25,646; Indian Queen, July 11th, $4,656.46; Mt. Diablo, July 12th, $8,188.58; Bodie Tunnel, July 18th, $3,500; Bodie Con., July 18th, $7,335; Mt. Diablo, July 15th, $6,563.55; Star, July 9th, $12,336; Northern Belle, July 13th, $6,762.29; Head Center, July 18th, $7,028; Hanauer, July 16th, $1,750; Christy, July 17th, $1,617; Horn Silver, July 16th, $2,500; Ontario, July 16th, $11,460; Custer, July 15th, $4,218; Christy, July 15th, $1,871; Stormont, July 15th, $3,928; Western, July 16th, $15.269 77; Northern Belle, July 16th, $8,406.92; Hananer, July 15th, $1,850; Germania, July 15th, $2,450; Mayflower, July 15th, $3,800; Horn Silver, July 15th, $35,000; Bullionville, July 15th, $2,318; Ontario, July 15th, $9,061.

The Eureka *Leader* says: The recent developments in the Geddes & Bertrand have given an impetns to the owners of mines in Secret canyon and the southern end of Prospect mountain. A tnnnel to cnt the mines in this end of the mountain is now projected, and it is possible that one or more mines in the vicinity will shortly change owners. The Basey, Irish Embassador, Burning Moscow, and other claims, have all shown up well and will undouhtedly prove among the hig mines of the future.

The Marysville *Appeal* of the 15th inst. says that four men were in that city the day preceeding with $50,000 in gold hars in their possession. The treasure was the result of the eeason's working of two hydraulic minee. The names of the men are J. P. Denson and F. Gourly, of Gihhonville, and George W. Cox and J. F. Williams, of Howland Flat. They were on their way to San Francisco to mint their hullion.

The principle of the hydraulic pump in the C. N. S. shaft has been demonstrated to he correct, and it only remains for the machinery to he manufactured strong enongh to hear the necessary pressure to adapt it to deep mining on the Comstock lode. The managers of the companies interested believe they have accomplished this result, and a further trial of the pump will he made this week.

I. N. Knight has returned from the East, says the Wood River *Times* of July 13th, having accomplished all that he went there to do. He succeeded in organizing a company in Council Bluffs to erect a 40-ton smelter in Croy's gulch, abont half a mile west of Hailey. The company has a capital of $100,000. Four of the directors will be here in a few days, and the location of the works will then he decided on.

Mining Summary.

The following is mostly condensed from journals puhlished in the interior, in proximity to the minss mentioned.

CALIFORNIA.

AMADOR.

Quartz Mountain.—Amador *Ledger*, July 16: This mine and mill at Lower Rancheria recommenced operations last Monday, after a period of idleness of over a year. Messrs. Williams and Woodbury, we believe of San Francisco, are mainly intercsted in its present activity, the latter gentleman being in charge of the works.

Miscellaneous.—S. H. Clark has struck some good paying blue gravel in his cement claim near Oleta.

The tunnel at Murphy's ridge makes slow progress. It has heen run a distance of about 400 ft since the work was resumed. No body of quartz worth speaking of has been encountered as yet.

Sutter Creek.—Sinking in the Amador is still rapidly progressing. A depth of about 800 ft from the surface has been attained. Two or three months more of sinking will meet all requirements for prospecting. In the Down shaft, north of Lincoln, things are moving slowly. Fou or five mnn are employed sinkiug, and everything apparently is going along satisfactorily. This new pumping machinery at the Mahouey was started last week, and works admirably. The taking of water from the shaft is proceeding satisfactorily. It will requirs about two weeks to drain the shaft.

Volcano.—Rich rock has been struck in the Wide West mine, located near the Acme, both being under the supervision of Mr Kelly. The ledgs is 4 ft wids, and contains free gold. It is estimated that the rock will pay about $75 per ton. Rich rock has also heen struck in the Coso mine, located in Pioneer district, and owned by Haskell & Co. The width of the ledge is 20 inches. Operations continue day and night.

Started Up.—The Golden Gate mine, located on Sutter crsek, one mile above town, has been started up with all indications of a favorable run. The timhering of the shaft has been completed, new hoisting works have heen erected, and an addition pnt on. Over $10,000 has been oxpended in procuring the necessary machinery and making preparations for the commencement of a new run. J. Moyle, the Superintendent, has returned from Arizona, where he has heen examiuing mines.

CALAVERAS.

Norwich Mine.—July 9th the main shaft had attained a depth of 185½ ft. A new 3-4 wire cahls has been put in the north compartment, and another of the same dimension was on the ground, and will he put in the south compartment, which will be made ready for it in a few days. An ore dump, the capacity of which is 150 tons, will be completed this week. All necessary castings, etc., for putting the battery of the 18-stamp mill in perfect working order are on this ground. The work of improving and re-modeling the mill is under way, and will he completed in about two weeks. Immediately thereafter, the mill will be started up on Norwich ore, of which there were many tons raisod while in the course of sinking, and which was encountered in the downward progress of the shaft.

West Point Notes.—At the Champion mine, stoping on the 700 level still continues. Mill kept running night and day on good rock. We understand that some of our energetic citizens are contemplating a lease of that well-known mine—the Lone Star. The amount is close on to $25,000. Rose & Jenkins are still sinking the main shaft on the Henry lode; width of vein, 18 inches, showing plenty of gold and sulphurets. Present depth of shaft 108 ft. Ferguson & Co. are engaged in sinking the main shaft of the Colorado mine with the air-drill. The quartz in shaft shows plenty of free gold. Kelly & Co. are taking out some splendid rock from the Constitution mine. Staeger & Co have struck a large body of quartz near the Duna mine which prospects good. Width of vein 3 ft. Everybody and everything is kept busy at work in or about the mines of this district, which ars opening up to the satisfaction of their owners.

Glencoe Items.—Mr. Clark is still operating in Specimen gulch. The ditch that will convey the water to the Valentine is now completed. It makes the third that Mr. C. has made this season. Lewis & Fairchild have commenced stoping. They are taking out some good rock.

Southern Mines.—*Mountain Echo*, July 12: Operations have commenced on the Jones mine. Six or seven men are ready at work. In grading off a place to sink a shaft, gold was discovered in the croppings. Second grade ore at the Collier mine pays $180 per ton. We were shown some specimens of ore last week taken from Uno mine in Nassau valley. It is very good looking rock, and some specks of gold were visible upon the surface of the quartz. The new hoisting works on the McElroy mine are about completed, and work will be commenced in a few days. The Monarchville mine is being vigorously worked, and is looking splendid.

EL DORADO.

Mining Activity.—*Mountain Democrat*, July 16: Very great activity prevails in and about the mines over which W. K. Aldersley holds the superintendency—the Chaparral and the Gopher and Bowlder mines, in Kelsey district. At the Chaparral, tunnels are being run on the main ledge both north and south of Kelsey creek, with no material change in size or appearance of ledge, or in quality of ore. At the Oopher mine the old "Sip incline" has been sunk to greater depth, and drifts are being run from both directions to connect it with the main shaft recently sunk. The new tuunel that was started a few weeks ago for the main Bowlder ledge is now in over 100 ft, and is making rapid progress. Even with the small amount of work that has been done, in a short time and at insignificant cost in the main shaft and incline not less than 15,-000 tons of good millings are now be exposed. In the two claims, above the level of the mill, we estimate that there is not less thau 150,000 tons of ore. The quartz they are now taking from the incline will average over $20 per ton

High Grade.—Georgetown *Gazette*, July 15: A vein of high-grade ore, some 3 ft wide, has been discovered in the crosscut now being made from the shaft to tap the ledge on the third level of the Eureka mine. It is thought to be about 32 ft from the bottom of the shaft to the main lode, and the new or oranch ledge was met with when in on the crosscut about 9 ft. This rock is thought to be far above the average of this main lode, and shows very well in free gold. As Mr. Baird remarked, this is a mine in itself. This same vein of quartz was met with in the shaft some distance above, but was not more than one-half as wide, and although it prospected very well, little was thought about it. From the angle of its dip, it is estimated that the contact with the mother lode takes place about 100 ft farther dowo. Other smaller stringers prospecting fair in free gold have been met with, most notably one near the bottom of the shaft, all dipping east toward the mother lode. It is enough for us to repeat the prevailing sentiment of our practical miners that the Eureka mine is a grand success, and promises to rank among the best permauent dividend paying mines in the State.

INYO.

Deep Springs.—Inyo *Independent*, July 16: After 6 days of hard work in examining the very numerous fine mining properties of Deep Spring district, Capt. H. H. Todd and Mr. A. H. Griswold left by the northern line on Tuesday last. They took with them complete samples from every point, for assaying at Benton and San Francisco. They have gone to Columbus to examine a mill there, with a view to its immediate removal to Deep Spring.

Panamint.—During last week a great water spout broke in Panamint canyon, destroying 6 miles of the fine and costly grade, so that it became necessary to build a trail to get a pack-mule over it. The water, which has been decreasing in the canyon for a long time, is now more plentiful. A party of Eastern men, headed by Geo. M. Pinney, is expected in the camp. Messrs. Phehy & An-

thony shipped silver bullion to the amount of $6,000 last Tuesday.

MINES BONDED.—Bonds for deeds to mining property were placed upon the county records July 11th, as follows: The New Year and Golden Wedge mines, by Swearingen, Walmright & Buckles to Ed. Loose; consideration $7,500, to be paid November 30th. Also, the Red Cloud and 200 ft of the Emmett mine, by Jos. and Jas. Rowan to C. E. Loose and R. A. Russell; consideration of deed $10,000, the bonding parties to carry on such work of development as they please in the meanwhile. The properties are situated in the Bishop Creek district, near Antelope springs, and are said to be valuable mines, bearing mostly gold.

THE PAJARO.—We hear that it is the intention of Messrs. Storey and Ford, resident managers of the big gold mine at Bishop creek, to prosecute the work of development from 250 to 350 ft in depth as rapidly as possible. Reduction works will then be placed upon the property on a scale commensurate with the showing of ore.

MONO.

BODIE.—*Free Press*, July 19: It takes a great deal of time and labor to open up a mine, even when the ore body is found, and how much longer does it require a company to explore its ground. A great many people are growing impatient because great developments are not being made in Bodie district, but those who look at the matter coolly are satisfied that the developments will come in time and when least expected by the outside. The Standard has a great deal of ground on the 1000 level yet to investigate; in fact it can be said that that level is entirely unexplored. The character of the ground they are now working in is favorable, and the management feel no discouragement. A crosscut has been started west from the 600 level of the Red Cloud. This drift will, it is believed, show up something good, as it is to explore a portion of the Concordia ground. Ore never looked better than it does at present. During the past week a large number of visitors were admitted to look at the developments recently made, and they all speak in glowing terms of the prospects. The Addenda has also the prospects of becoming a good mine. Bechtel is crushing ore, and it assays better than at first expected. Grading for the Bodie Tunnel mill has commenced, and the work will be pushed forward as rapidly as possible. The Bodie Tunnel has very large showing of ore, and the ground is but little prospected. The Supt. of the Con. Pacific states that a streak of rich ore has been encountered on the 600 level, and it assays well. Prospecting is still going on in the Noondays, and the Bodie Con. continues to ship bullion. During the past week the Standard Co. shipped $14,390.05.

MARIPOSA.

BIG FLUME.—Mariposa *Gazette*, July 16: Col. W. W. Swadley, of the Red Banks, was in town one day this week. We learn the Col. has completed arrangements for the building of a flume 1½ miles in length and 4 ft in width, from the Benton mills dam to the Red Banks hydraulic mine, which will furnish a sufficient supply of water for the immense works at that place. We have always contended that the Red Banks contained vast wealth, and the building of this flume confirms our assertion.

SIXTEEN OR TWENTY.—The silver mines below town—that is both companies—employ between 16 and 20 men at the present time. Things appear to be quite lively in that section now. There is no doubt but immense wealth is deposited in these mines.

NEVADA.

REMOVING THE MILL.—Nevada *Transcript*, July 14: E. H. Dyer, of Alameda, one of the principal owners of the Republic quartz mine, at Granitoville, which has been idle for several years, went up to the claim yesterday morning to complete arrangements for removing the mill (a 40-stamp one we are told), to Oroville, where it is to be re-erected to do custom work. There are a large number of small auriferous quartz ledges in the vicinity of Oroville, but it is said that so far there have been no milling facilities so they could be worked.

NO MORE CHINESE.—Nevada *Transcript*, July 19: The only obstacle in the way so far to complete harmony of action between the people of the mountains and the hydraulic mining companies has been the fact that some of the latter employed in certain departments Chinese laborers to the exclusion of white men who were willing to do an honest day's work for fair wages. But at last, thank God, an order has gone forth that no more Celestials need apply at either the North Bloomfield or the Milton mines. We have this from the very best authority, and can confidently assure our readers that the new order of things is to be permanent. Since writing the above we are informed—not officially, however, that the Blue Tent Co. have concluded to dispense with Chinese labor in the future.

BANNER MINE.—Nevada *Herald*, July 10: The indications at the Banner mine are now very encouraging. The ledge at the bottom of the incline is 14 inches wide, and the quartz taken from it is heavily charged with high grade sulphurets. A crushing of rock is now being had at Martin & Michell's mill, at Canada hill, but it is thought the yield will not be very large, as there was considerable waste and inferior ore mixed up with the quartz. The last crushing paid about $25 to the ton.

PLUMAS.

AN EXTENSIVE OPERATION.—Plumas *National*, July 10: One of the most extensive prospecting enterprises inaugurated in Plumas county has been put in operation in this valley during the past two or three months by Prof. J. E. Mills, of Boston. After a thorough survey and a prolonged and exhausting examination of the numerous channels at the head of the valley, he has evidently arrived at the conclusion that a very large amount of gold has been deposited on the bedrock of the valley, and he is now making extensive arrangements to find it. His staff has been located on the old Stinson ranch, half a mile from town, and a short distance to the west of the road. A large double shaft has been started and put down a few feet by hand. Over this is now being built a very substantial frame-work to hold the necessary machinery to put this shaft to bedrock. The timbers are large, and evidently selected for permanency and durability. A boiler, engine and pump are on the ground, ready for use as soon as they can be put in place, and a number of carpenters, under the direction of Mr. A. J. Quigley, are pushing the work as rapidly as possible. Just how deep it will be necessary to sink is not known, and estimates of the depth go all the way from 200 to 400 ft.

GRANITE BASIN.—Mr. T. H. Ward came up from the Basin on Monday. From him we learn that the mines are looking well, and the owners are pushing along as rapidly as possible. The Franklin mill started up a week or so ago, and will be kept running steadily from this time on. They have experienced considerable trouble in their main tunnel by striking some wet ground, which has proved exceedingly difficult to handle, but the difficulty has been overcome, and they are now going ahead in good shape. Minto & Co., who bought the Sullivan & O'Brien claims, are running the tunnel ahead steadily, and are now in splendid rock. They have a large mill on the road, and will put it up as soon as possible after it arrives. There is no question as to the value of their mine, and they have abundant means to make all necessary improvements. A. P. White has been running his mill with good results, and his property is said to be looking well. Considerable prospecting is being done, and everything looks prosperous for the Basin country. The most pressing want of that section is the proper machinery for working the sulphurets, and it is hoped that works of this character will be built there before the season is over. We are inclined to think that some capitalist could make a splendid investment of a few thousand dollars by putting up chlorination works at some central point in the Basin and working the sulphurets from all the mines. There is no question as to the value of the sulphurets, as assays from all quarters demonstrate that they are rich, but under the present working no gold from them is saved. A little capital would prove Granite Basin one of the best quartz districts in Plumas.

GOOD.—Greenville *Bulletin*, July 12: Corbin & Co. are getting good returns from their gravel claim at Elizabethtown. Last Thursday $480 was taken out, one chunk alone being worth $195. W. S. Dean, of Prattville, called here last Friday, on his way to Granite Basin, where he is interested in mining, and will soon erect a mill. He has a quartz gravel claim covering 20 acres of a rich deposit, and proposes to work it with light stamps, of not over 350 to 400 lbs. each.

PLACER.

THE RISING SUN MINE.—Placer *Herald*, July 16: The new 20-stamp mill at the Rising Sun mine was completed and put in operation last week, and everything is running as smoothly and satisfactorily as could be desired. The mine throughout presents quite an improvement in appearance, with plenty of good ore in sight, and promises handsomely to reward the company in the way of big productions. The mine, which has for years borne the reputation of a first-class, will soon be in a way, with the increased force of men, to eclipse its former excellent record as a bullion producer. The new Arnold shaft, situated about 700 ft from the present workings, has reached a depth of 150 ft on a large well-defined ledge of highly sulphureted ore, showing considerable free gold. The new hoisting works being erected on the Arnold shaft are rapidly approaching completion, and in a short time steam will be started up. Altogether during the last couple of months the appearance of the property has undergone considerable change by improvements on the surface and developments in the mine.

DOING WELL.—Placer *Argus*, July 10: The Mountain Gate mine at Damascus is doing splendidly at present, and persons who know anything about the mine agree in saying it is one of the very best mines in Placer county. It has lately paid $400 per share for a 33 days' run, after paying all expenses. There are 21 shares in the mine. The tunnel extends into the hill about 1¼ mile, and runs in a northerly and southerly direction. Recently the miners found a deposit of cement which pitches off. They ran a slope to the bottom of the cement, and then followed it easterly for about 200 ft, when they struck a channel or what is supposed to be an old river bed running nearly parallel with the main tunnel. Between the cement and the bedrock what is believed to be an extensive deposit of fine river gold has been found. It is nearly in the center of the ridge between the north fork of the American river and El Dorado canyon.

SIERRA.

EXTENSION.—*Mountain Messenger*, July 16: The B. M. Extension mine is proving all that its owners expected, On Saturday from one set of timbers (about 28 sq ft), 6 ozs. of gold were taken out. Sunday, from the same space, over 5 ozs., and on Monday from half a set, 3 ozs. The gold is 950 fine and worth here $18.75 per ounce. The company are working 11 men.

ARASTRAS.—John Lavezzola is putting up a lot of arastras on the Jim Kane place, at Sierra city. He has bought the sand pile on the flat above the city, owned by the Buttes men, and will work it.

FOUR HILLS.—Eight men are now at work on the Four Hills mine, Geo. Reynolds, Supt. Everything is progressing smoothly. This claim has the largest outcrop of quartz of any ever discovered in this section, the ledge being as much as 80 ft wide in places.

WILSHOUTH.—The shaft of the Wilbourn Con. mine is now down 140 ft in good looking quartz gravel which prospects. They will evidently touch bottom soon.

THE RUBY Co. ran 240 ft of tunnel for Juno, through hard quartzite rock, with their Burleigh drill, working 27 days, very creditable for Supt. H. W. Wallis.

WAHOO.—The Ohio drift claim has been paying $25 to the pick. There is 900 ft of tunnel in this claim, and 20 men are employed. The Roscoe ground, J. Littick, P. Doray and A. Courtright, owners, is being prospected by a tunnel. In the West Point, James Crooke and others are cleaning out an old tunnel preparatory to opening the mine.

BLUE GRAVEL.—This Co. have let a contract for 100 ft of tunnel.

THE 1001 Co. have let a contract to run 200 ft of tunnel on their load.

PORT WINE.—French Co. are doing well and work 22 men. A tunnel, nearly 900 ft in length, is being run into the back ground of the Queen, and the men are kept busy. Work may soon be resumed in the Union drift claims, that are believed good diggings, as the noted Monte Christo diggings, on the opposite ridge, paid $2.75 to the pick. D. McLaughlin has been drifting, but has concluded to turn his claim into hydraulic diggings.

NEVADA.

WASHOE DISTRICT.

CON. VIRGINIA.—A sump is being excavated for the winze-joint with the California, and on the 2500 level are engaged in cutting out a station for the same winze.

HALE & NORCROSS.—The sinking of the three-compartment winze from the 2400 level is retarded by the flow of hot water encountered last week.

CALIFORNIA.—Are extracting the usual amount of ore. It is of fair grade, and taken from the 2000 level.

CHOLLAR-NORCROSS-SAVAGE SHAFT.—The hydraulic pumps are running nicely. Some changes are in contemplation that will add to their completeness, and they will be made shortly.

SUTRO TUNNEL.—The south lateral drift was driven 88 ft the past week. Total distance in, 4,226 ft. The face is in hard ground, with andesite rock.

KENTUCK.—In cleaning up the old drifts, and opening out working stations, about 10 tons of ore are daily extracted from the various levels. The ore and waste is brought to the surface together and sorted on the dump.

SIERRA NEVADA.—The ore extracted the past week assayed $20 to the ton. There was a slight falling off in the amount, as only 40 tons were taken out.

BULLION.—The air compressor is in place. A pump hoist has been sent for and preparations are making for its reception when it arrives from San Francisco.

YELLOW JACKET.—The east drift on the 3000 level is run 42 ft per week, and is in a total distance to-day of 214 ft from the shaft.

UNION SHAFT.—The foundation for a pump on the 2700 level has been completed and the work of putting in the pump commenced.

ALTA.—The main line of pumps are working well. An Ingersoll drill is used in the bottom of the shaft for sinking.

FORMAN SHAFT.—A strong flow of water was struck in the bottom of the shaft last week.

ESMERALDA DISTRICT.

PROGRESS IN THE CAMP.—Esmeralda *Herald*, July 10: The mines at work are looking better every day, and as depth is attained in them the rock improves in proportion.

THE CENTENNIAL.—The east drift on the 150 level has been advanced several ft during the week, and is now in about 160 ft. The ledge in the face of the drift is looking well. The incline has attained a depth of about 213 ft, and the ledge in the bottom is much stronger and richer than at any other point.

CORTEZ.—The rich ore dump is rapidly assuming proportions gigantic, several tons having been added this week in driving the drifts and incline. The average of the rock is fully $200. The east and west drift has been advanced 10 ft each for the week ending last night, making the former 49 and the latter 64 ft. The east drift shows narrow streaks of very rich ore, while the whole face of the west drift is of $200 ore.

THE HUMBOLDT WEST.—The hoye are drifting south on the ledge, and have made fair progress for the week. The ledge continues to show the same character of ore as that found in the crosscut.

TEM PAHUTE DISTRICT.

PROBABLE RESUMPTION OF WORK.—Pioche *Record*, July 9: Indications all point to a resumption of work in this district at an early day. A mill site has been taken up for Mr. Cardeza and sent here to be recorded. There is now a strong effort being made by a number of parties interested in Tem Pahute property to get a little capital in that place; heretofore, however, they have always endeavored to keep capital out, throwing every obstacle in the way they possibly could, but now as the prospectors in the district are about starved out, they are willing to act half-way decent.

WASHINGTON DISTRICT.

THE OUTLOOK.—Cor. Esmeralda *Herald*, July 16: Having been on a prospecting trip in this district for about 2 weeks, I thought a few items in regard to the camp might be interesting. The mill consists of a Huntington I-stamp battery of 900 lbs. weight, which breaks and grinds the rock at the same time, and a Dodge concentrator, which concentrates 10 tons into 1. The capacity of the mill is 3 tons every 24 hours. As the mill has proved a success in California and Arizona, Supt. Bisson is positive that he can make a success in working the ores of this district. Should the Bower Co. conclude to buy ores of the miners and give them a certain per cent of the assay value, it would be but a short time before there would be 200 men at work here. The country rock here is granite, and the ledges are narrow and numerous, and the most of them are very rich. The only thing that is needed to make this a good camp is machinery that will work the ore successfully and cheaply. The general appearance of the country is very rough; the river rushes and foams down through a narrow gorge in the mountains, affording the finest water privileges to be found anywhere; the hillsides rise abruptly and almost perpendicular from the riverside to a hight of from 200 to 500 ft. Supt. Bisson has about a dozen men at work, and intends to put more to work as soon as he can procure more tools. The more I see of Esmeralda county the more I am astonished at the large amount of mineral country that is lying idle; but it will not be so long.

ARIZONA.

GLOBE DISTRICT.—Globe *Chronicle*, July 11: Hoisting works will be in position on the Mark Morris by Monday, when work will proceed more rapidly than ever. Mine looking splendid.

SILVER FAME.—Although no work has been performed on this property for several weeks, it looks well as far as development has gone, and has promise of becoming a very valuable property. The 50-ft shaft shows a streak of very rich chloride ore from top to bottom.

PINAL COPPER CO.—We learn from reliable sources that the smelter of the Pinal Copper Co. will be in operation within another month.

GOWAN.—This property is located on the east fork of the Verde. The ledge has been cut on the surface, showing a width of 14 ft of ore, all of which carries gold in paying quantities. A 2-inch streak of exceptionally rich ore runs through the ledge.

SHERMAN.—We were shown some exceedingly rich ore from this property a few days ago, which recent work has developed, and the prospects are favorable for coming into a large body of it. The Sherman is unquestionably located on the Stonewall ledge.

EAST RICHMOND.—Mr. Risbridger, one of the owners of this valuable property, is taking out some very rich ore, and it is quite probable that he will soon be ready to make a good-sized shipment of it to San Francisco, there being no mill available in the district. The main shaft has reached a depth of 100 ft, from which a drift has been run 70 ft east toward the Mack Morris, and shows a magnificent body of ore.

THE STONEWALL, No. 1.—Development is being pushed rapidly, with gratifying results. An iron whim is being put on the main shaft. A splendid specimen of work is seen in the timbering of this shaft, which will be extended to a depth of between 200 and 300 ft before further crosscutting is done. Twelve tons of rich ore is being hauled daily to the mill, and as soon as hoisting facilities are improved the ore output will be much larger.

SILVER NUGGET.—Supt. Lennon is pushing work ahead rapidly on this property. In the north drift the vein is 3½ ft in width, and a good showing of ore is made. The east crosscut on the same level is in 110 ft.

TONTO BASIN.—We learn that Wm. C. Groseo, who left here some weeks ago for the Touto Basin country, has made a good strike in a property owned by Messrs. Benbrook, Hobbins, Birchett and himself. A clean-up from 25 tons of their ore worked in an arastra last month produced upwards of $2,000, fine gold.

SADDLE MOUNTAIN.—Dick Martell has just returned from Saddle mountain. Mr. Martell is very favorably impressed with the outlook of the district, and thinks that in the near future a lively, booming camp will spring up. There are five parallel veins running through the district, all of which carry high grade carbonate ore. These properties being located not far distant from the newly discovered coal fields, will doubtless become very valuable as soon as active development is commenced.

MORTGAGED.—Arizona *Journal*, July 14: The Holland S. M. Co., in the Patagonia district, have mortgaged the mine, with furnace, personal property and all the appurtenances thereunto belonging, for the sum of $50,000 to the Union Trust Co., of New York city. Terms, 3 years at 6%. It is understood that this has been negotiated for the purpose of discharging existing liabilities and proceeding at once with a fuller development of the property.

CONTINENTAL.—Pinal *Drill*, July 15: The tunnel in the Australia is 22 ft, a large body of ore is in view, the ore in the vein is fully 3 ft wide and looks well. We have assays at $30 to $170; some is smelting and some free milling ore. Additional smelters are being put up at Willow springs for running some of this ore and that from the Nacoocha, on the same ledge, into pigs. The Nacoocha shows a vein of carbonate and galena over 3 ft wide, and a large body of ore is exposed which is very readily mined and smelted.

THE WINDSOR Co.'s new roaster is in place, but the work is delayed for want of some little articles and appurtenances which were not shipped with the roaster, by mistake or neglect.

SHIPMENT BY SILVER KING.—Sixteen hars, 19,931 ozs., value, $25,640.02. We have seen a large block of ore from the depth of over 700 ft, very rich and full of free silver. Same character of ore as above. The mill is running full force.

FLORA MORRISON.—Tombstone *Epitaph*, July 10: The new hoisting works will not be running as soon as heretofore stated, owing to some defect in the bed-plates of the engine, which have to be duplicated in San Francisco. Work in the mine goes forward with the usual rapidity.

SULPHURET.—Work setting the pump boiler goes rapidly forward, and by the time the pump arrives this job will be complete, and all that will have to be done will be to put it in and start up. Now that machinery is being put up, the world will soon know something of the extent and richness of the ore body below the water level.

NEPTUNE.—BISBEE.—Since last report all the machinery for the 30-ton smelter has been delivered at Hereford, and the boiler has been set. Carpenters are busy at work on the buildings, and the erection of the engine and smelter will be pushed as rapidly as possible. At the mine, in running a drift to connect the shaft on the eastern portion of the Neptune, with shaft No. 1, a large body of high grade carbonate ore was struck on the 13th inst. Since last report have taken out 25 tons rich sulphide ore from shaft No. 2, and the drift is being continued from this shaft with best of prospects. The outlook for Neptune is first-class.

TOMBSTONE M. AND M. CO.—The ore bodies all continue in much the same condition as at last report. The ore house for the main shaft and southeast workings is nearly complete. The mills are running at their full capacity on ore that will probably hold up to about the same grade as last month, which, if it does, will give an output of nearly or quite $200,000 for the month of July, as against $157,000 for June. All the stamps are wet crushing now, whereas 10 crushed dry during a portion or all of last month.

GRAND CENTRAL.—The foundation for the engine was completed yesterday. The shaft is down 220 ft in good working rock. The boxes will be in running order by the 10th of next month.

VIZINA.—Started sinking main shaft again the first of the week. The point at which they commenced sinking was 336 ft below the collar or top of the shaft. Up to yesterday they had shipped 236 tons of ore to the mill, and will ship as much more during the balance of the month, which will make 472 tons.

WINFIELD.—Near the Merrimac House; shaft down 80 ft; vein, 3 ft wide—the ore all being good grade, much of it very rich in horn silver.

CINCINNATI.—Down 310 ft, the rock working well. They struck a small vein of good looking ore on Friday last which shows they are getting into the ore-bearing country.

BUNKER HILL.—Sinking with good prospects. Will go down 200 ft, when a whim will be put up, and then a level will be run on the ledge to thoroughly prospect it.

COPPER QUEEN.—This old stand-by is looking well in every part. They are engaged in the erection of a whim with which to do their hoisting hereafter. The new smelter will be ready to run as soon as the water in the spring raises from effects of summer rain.

GIRARD.—It is the same old story—work progressing favorably and the ore-breasts looking well. The usual amount of 12 tons of rich ore is sent to the dump every day.

IDAHO.

OREGONVILLE.—Butte *Miner*, July 14: In my last letter I stated that a sale of mining property in this district was about to be consummated. The sale has taken place, and $250,000 has been paid to the following parties: Jas. Glendinning, I. Birdsie, Pat. J. Kelley, E. Strickler, Geo. Crogan, John Means, Luther Johnson, James Neishwander, Davie Bros., Geo. Orr, E. Matthews, John Scanlan, Maw Bros., Ira Foghley and F. Philips. Twelve of this number are old Montana miners. Gibbonsville camp is only 8 miles from the Montana line, and 0 out of 10 in this camp would prefer to have it 50 miles inside of Montana's limits. Taking the Big Hole and Bannack road we are within 05 miles of the Utah & Northern railroad. Four miles of a wagon road will have to be built and this camp will be open to travel 8 months in the year, and we will be able to get our supplies fully 20% lower than at present prices. The new company is named the Golden Circle M. Co. Mr. P. J. Kelley is superintendent. The new company has not commenced operations in their mines yet, but have a force of mechanics engaged in erecting houses. It is the intention of the company to put 100 men at work in their mines in a few weeks. Wages for miners are $3.50 per day, but I would not advise a rush of men to this camp just now.

WOOD RIVER MILL.—Wood River *Times*, July 16: A boiler, 40-horse power engine and all the requisite machinery for a gold and silver mill, was hauled through Hailey last Friday and taken into Croy's gulch, to a point about 3 miles from town, where it will be erected at once. The mill consists of a rock breaker and pulverizer, with shafting, pulleys, engine, boiler, etc, and is warranted to work 1 ton per hour, or 24 tons per day of 24 hours. It is believed to be a very expensive mill to run, but its small cost and the rapidity with which it can be erected probably induced the present owners to buy. It comes new from the East.

THE GALENA SMELTER.—The 30-ton smelter which is about to be erected near the Senate mine at Galena, was hauled through Hailey last Sunday on 5 wagons. It will be taken to Ketchum, where the loads will have to be transferred to light wagons, the bridges between that place and Galena not being strong enough to permit the hauling over them of loads weighing over 5,000 or 6,000 lbs. The smelter will probably be delivered in about 10 days.

EUREKA.—A development, which has given renewed hope to every inhabitant of this section who has heard of it, has just been made in the canyon, about a quarter of a mile above the town of Bullion. Early last week some prospectors working on the Eureka claim cut into a small vein of galena. The development being on the line of the Idahoan, and the formation similar to that of that valuable mine, the prospectors were not long in finding a purchaser in Col Wall, Superintendent of the Bullion and Mayflower, who had had his eye on the claim from the start. Last Wednesday he paid $3,500 cash for it, and half an hour after refused to sell it for $0,000 to C. D. Bradley, Superintendent of the Jay Gould. Thursday morning, Col. Wall put three men at work making a cut into the hill, at a point about 200 ft below the discovery. They had hardly got to work before they uncovered pieces of galena float, weighing several hundred pounds. In a few hours thereafter they cut into a two-inch seam of galena. This was followed by another of about the same size, and still another, but much larger, and yet another. The men now stopped driving the cut, and began stripping their ledge until it was exposed for a length of about 40 ft, and a thickness of about 5. Four seams of galena, aggregating over 2 ft in width, were uncovered altogether. The ore is foliated galena. It carries about 70% lead and an average of 120 ozs silver per ton. This new ore-producer is known as the "Eureka." It is located about half a mile west of the Idahoan, and there appears to be no doubt but that it is on the same ledge as the Idahoan.

MONTANA.

MOULTON.—Butte *Miner*, July 12: The sinking of the main shaft of the Moultou mine, at 400 ft deep, is suspended for 5 or 6 days, and until the cutting out of the station at the 400 level is completed. When sinking is again commenced the Ingersoll drill will be used in the bottom of the shaft, which will expedite the dropping of the shaft. At the 200 level a 9-ft vein has been opened.

THE ALICE.—The upper levels of the Alice mine are yielding their quota of ore very regularly, with no new developments to note in those levels. Much of the ore daily crushed in the Alice mills is taken from the 500, 000 and 700 levels.

LEXINGTON.—The sinking machinery at the main shaft of the Lexington mine is in excellent working order now, and the shaft is going down with a fair rate of speed. Saturday the shaft had reached a depth of 170 ft, with the rock in the bottom comparatively soft. Work at the old incline shaft, which produces the ore that keeps the Davis 10-stamp mill running, proceeds with the same regularity that it has for several months past.

MAGNA CHARTA.—At the Magna Charta mine the old workings are looking well and the ore coming out is fully up to the standard of the mine. The new hoist-house is about completed, and the foundation for the Howland pulverizer is nearing completion. In excavating for the building for the pulverizer, a large vein of quartz was struck. Some of the ore taken from this vein assayed well, showing as high as $150 to the ton.

NEW MEXICO.

LOTS OF NUGGETS.—*News* and *Press*: Col. Bergmann, in his three clean-ups this year of his placer claims on Ute creek, has taken out over 90 nuggets, varying from $5 to $100 in value, besides about 200 ozs of dust.

COPPER EXCITEMENT.—The miners about Ute creek are just waking up to the value of the copper veins in "Old Baldy." The prospect of the transfer to a Nashville company of the Mayflower, Monarch and Pullman lodes has created some excitement, and we hear of several new copper discoveries on both sides of Baldy. Some of the specimens are very beautiful and give promise of rich mines.

THE TAOS DISTRICT.—We have received no letter from this camp this week, but we hear indirectly of many new discoveries and the enlargement of the district. The camp is yet so new that the few prospectors there have not been able to take up all the prospects yet, and consequently have little time for development work. There is a prospect of an assayer being located there, which will prove a great convenience to the boys.

THE CIMARRON CO.—This company, which is operating the Rebel Chief mine in the Ute Creek district, have just had the misfortune to break their Howland pulverizer, one of the mullers having torn through the cast-iron side. From their experience with the Howland pulverizer we are not favorably impressed with it. At first they attempted to put the quicksilver in the pulverizer as is claimed by the manufacturers to be successful. The mercury floured and nothing could be done in that way. The riffles and sluices alone would not save the gold, so they were obliged to put in dollytubs. These delays and changes have seriously interfered with their work. Before the break they had run about 250 tons in the 25 days of operation. We understand that the clean-up was satisfactory, but there is some talk of substituting a stamp mill for the pulverizer, which, although grinding the ore well, does not save the gold. The Rebel Chief has about 1,500 tons of ore on the dump, and we shall be glad to see work resumed.

A California Beet Sugar Factory.

The successful manufacture of beet sugar in California has attracted much attention from those who are promoting experiments in beet sugar making at the East. The factory at Alvarado, Alameda county, is the establishment which is winning the State a reputation in this respect.

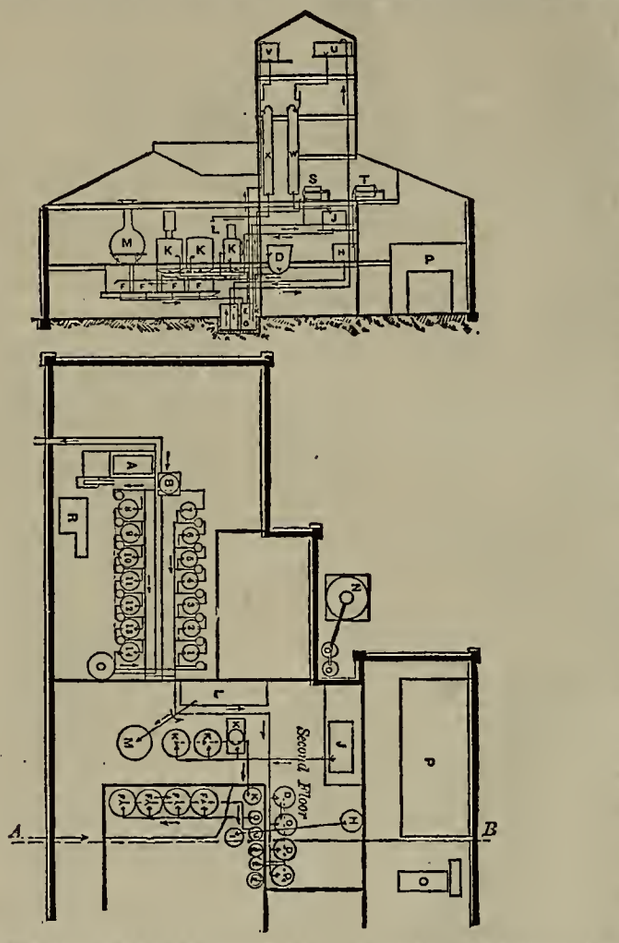
We find in *The Sugar Beet*, a Philadelphia quarterly devoted to the beet sugar industry, an engraving showing a section of the elevation of the Alvarado factory, and the ground plan of the same. The engraving is accompanied by a description of the progress of the juice from the heet to the sugar box. As this is of interest as showing one of the newer industries of our State, and as it will also give the general reader some idea of the process of beet sugar making, and the means employed, we shall reproduce from *The Sugar Beet*, the engraving and leading points in the description.

Some years ago the Alvarado factory was started under bad management and failed. Later, it was completely reorganized, and in 1879 was owned by the Standard Sugar Manufacturing Company, from which time excellent sugar has been made. This factory is situated on the Alameda Creek at Alvarado, and has connection with a siding about a half mile in length of the South Pacific Railroad. The buildings cover an acre of ground, but about thirty acres are used for various purposes. The main building is 80x250 feet, several stories in hight, and surmounted by a tower seventy-five feet high.

The beets that arrive in the factory are thrown into the washer, *A*, which is 8½ ft. long, 4 ft. diameter; capacity, 100 tons in 24 hours. The dirty water and all the debris from the beets is discharged into a sewer, into which all the condensed water of the factory is collected, and is carried by a flume on to the adjoining lands belonging to the company (see plan). From the washer the beets are carried upon a moving apron 27 ft. long, to the floor above, when they are thrown into the slicer, *B*, that makes 160 revolutions per minute. It has eight plates (16 blades or knives). The knives are changed only once in 24 hours, as a general rule. No stones are ever found in the beets. It will cut from 100 to 150 tons a day. The resulting cossettes pass into small two-wheeled wagons that hold about 300 lbs., and run on the floor; these may be placed in proximity to one of the cylinders of the diffusion battery. Fourteen of the latter are in the series, and are in two lines of seven each. Their dimensions are 4x6 ft., and have between them a heater. The battery is made to work from right to left in the order in which the cylinders are numbered. The water for supplying the battery has a fall of 60 ft. Before commencing, it is necessary to have a supply of heated water. For this purpose any three cylinders and their heaters may be taken, provided they lay immediately behind the first cylinder to be used to diffuse the beets.

Now, desiring to make the first diffusion in No. 1, we will fill Nos. 12, 13 and 14, which communicate with each other, with water raised to 60° or 65° C., as it passes through the heater attached to these cylinders or tanks. Then, a connection is made with No. 1 filled with sliced beets, the water passes from tank 14 through heater No. 1 at a temperature from 60° to 65° C., into tank No. 1. The pressure of the water-supply forces the water from No. 13 into No. 14, which we have just emptied, and fills No. 12 with cold water; thus the hot water is kept in advance of the cold, and is forced around the battery in the circuit as it is required. The water may be heated in the first instance in the heater of the tank which is to diffuse the beets, but this would take too long; so a supply is heated at first, and passed around as we have indicated above. When tank No. 1 is full of water of the required temperature, close the top cover and open air valve at top, and allow all the air to escape, then let it remain 15 minutes with full pressure of water. Now connect tank No. 2 (this has previously been filled with sliced beets) with No. 1, and pass the juice into the former, keeping the temperature from 60° to 65° C., as it passes through heater No. 2 in its course (tank No. 1 is again filled through pressure with the warm water from No. 14, and 14 from 13, and so on). When tank No. 2 is full of juice, close top and open air valve as in No. 1, then allow it to stand under full pressure of water 15 minutes; then open the valve and pass the juice by pressure through heater No. 3 to tank No. 3, with temperature as before from 60° to 65°; now close the tank and proceed as in case of Nos. 1 and 2. After the juice has stood in No. 3 15 minutes, if it has a sufficient degree of strength—say, 10° to 12°, about 300 gallons are drawn off, or a little more than enough to fill one tank with water; when the beets are in, this juice is sent to the defecating tanks. Should the juice not yet be of sufficient strength, it should be passed into No. 4, and stand for 15 minutes longer. After having drawn the quantity of juice indicated from No 3, connect tank No. 4 with No. 3, keeping the juice at the proper temperature as it passes through the heaters, Nos. 2, 3 and 4; now allow No. 1 to gradually cool as the cold water passes through it. After No. 4 has stood 15 minutes, draw for it 300 gallons, as in case No. 3; then connect tanks Nos. 4 and 5, keeping the water at the proper temperature, as it passes through heaters Nos. 3, 4 and 5. Continue in this manner to draw off the juice every 15 minutes after filling, and open the connection with the succeeding tank, the pressure of the water advancing the strongest juice from tank to tank as they are opened, and so continue until all the tanks are full; then as fresh ranks are needed, shut the water supply from No. 1, and put No. 2 in communication with No. 14. The tank No. 1 is then emptied, which operation requires but five minutes; it is then cleaned, and five minutes are required to fill it with fresh cossettes. Three cylinders are out of the series at a time. The capacity of the cylinders of the battery is 2,400 lbs., and 100 tons may be diffused in 24 hours.

C is a tank that holds the waste water from the machines throughout the factory. When this overflows, it carries with it the refuse pulp which unfortunately, as we have said, has not as yet had any application, but it was thought that in 1881 it would be purchased by the farmers. From the battery the juice passes into the first defecation tanks, *D* (have for dimensions 5′ 6″ in diameter, and 4′ 6″ in hight), and marke 6° Baume. There are four of these, and 2% of lime is added. The carbonic acid from the lime kiln (*N*) that has previously passed through the washers, *Oo*, is brought into contact with the defecated juice for about 18 to 20 minutes; the total is heated by a steam jacket. The juice, on leaving *D*, falls into the montjus (capacity, 300 gallons), *E*, and is forced through to the filter presses, *S*, at 6 lbs. pressure to



SECTION OF ELEVATION AND GROUND PLAN OF ALVARADO BEET SUGARIE.

square inch (see section). There are five of these, which are of a German design and have 18 compartments. From there the juice runs into the second defecation tanks, *F*, four in number; these are of the same size as those of first defecation, heated by a steam coil; a small quantity of lime is then added, after which the juice flows into the montjus (same dimensions as *E*), *G*, and is forced through it into the second filter presses (same as *F*), *T*. The juice then collects into the tanks (capacity, 400 gallons), *H*, and is drawn into a montjus, *I* (there are two of these, each having a capacity of 400 gallons); the juice is then forced into the receiving tank, *U*, which is on the top of the tower. The object of having this at such a hight is to obtain an easy flow of juice through the (6) bone filters, *W;* these are 20 ft. high and 30 inches diameter, hold 98 cubic feet of juice; the bone-black is rehurned every 12 hours. The juice, after leaving these, flows into a tank, *J;* there are two of these, having each a capacity of 1,122 gallons; from these into the double effect, *K;* the juice marks 4° to 5° *B.* upon entering, and 25° when leaving. The vacuum pump that communicates with this double effect is attached to a walking-beam engine of 50 horse power (this engine also drives several other pumps; of these we may mention a Cameron pump for the vacuum pan). The juice then is run into a montjus of 300 gallons capacity; then into tank, *V*, capacity 600 gallons, placed at the top of tower; from this latter, it passes into six thick juice bone filters (*X*) of the same design as the first—the juice marks 25° upon entering, and 23° to 24° upon leaving; then into the tank *L* (two of these of 1,000 galls. capacity each); then into the vacuum pan *M*. The working of the bone-black is, in some respects, rather original; as the superintendent has invented a cylindrical washing-machine that can wash 18 to 20 tons in 24 hours, rejecting a German apparatus that had the same functions. This machine is said to work well, but before passing into it, the bone-black is fermented on the ground floor in vats; when the washing is completed, it is subsequently raised to the bone-kiln *P*—which is capable of burning 10 tons in 24 hours, requiring five men—by a moving apron 20 ft. long; after being thoroughly burned it is hoisted to the top of the tower and allowed to fall by a chute into the filters. Thirty barrels of sugar may be boiled at a strike in the vacuum pan; and after the strike is complete, the granulated mass is taken into the tanks by elevator to the fourth floor. After the proper crystallization is complete, it is thrown into the mixer and from there into the centrifugals (these have a velocity of 1,000 revolutions per minute, and are 30 inches in diameter and inches in hight); the sugar, when taken from these, is carried up to the second floor to the packing-room.

The above gives our readers a general idea of the working of the juice. Upon the grounds are the buildings, blacksmith-shops, store-houses, etc., which are most useful. The water for the factory is supplied from two artesian wells that have the respective depths of 212 and 270 ft. The boilers of the establishment are placed in a special building known as the boiler-house, which consume about 20 tons of coal a day, furnishing sufficient steam to run a 30-horse power slide-valve horizontal engine, and 40-horse power beam engine with eight pumps attached, and 20-horse power Cameron vacuum pump. There are six boilers altogether; two of these are 15 ft. long, while four are 14 ft. in length. Of the pumps throughout the establishment, there are no less than 23.

How Diseases are Propagated.—The assertion is made by Prof. Tyndall that diseases are propagated, not by effluvia or sewer gas, but by solid particles discharged into the atmosphere by currents of air or gas. This conclusion he was led to by the following experiment: He cut up a piece of steak steeped in water, heated it at a little above the temperature of the blood, then strained off the liquid; in a short time this fluid became turbid, and when examined through the microscope was found to be swarming with living organisms. By the application of heat these were killed, and when the solution was filtered he obtained a perfectly pure liquid, which, if kept free from particles of dust, would remain pure for an unlimited period; but if a fly were to dip its leg in fluid containing living organisms, and then into the pure liquid, the whole would be swarming with animalcules in 48 hours.

There is no malady or sickness more severe than not to be content with one's lot.

The Chautauqua Session at Monterey.

Two years ago the various Chautauqua Circles of California, organized an assembly at Ocean Grove, Monterey, as a branch of the famous Chautauqua Assembly, which for several years has attracted considerable attention in the Eastern States, and which is doing much to add interest to and popularize the study of science and literature there. The objects of this association are as follows:

First.—To encourage the organization of local circles for the study of such works as may from time to time be agreed upon, and have the benefit of mutual aid in considering each week the subjects read or studied. Men and women of ordinary abilities and education are encouraged to take part, and find it at once a source of interest, profit and pleasure.

Second—To provide a suitable course of summer lectures, where professional men and women, together with intellectually inclined persons of all ranks, can find both recreation and profit. This course of lectures will be given at Monterey, in connection with the meeting of all members of the circles as far as they can be present.

Third—To make collections of plants, shells, charts, interesting papers on various subjects, and curiosities of all sorts, and to arrange them in a proper form for reference and study.

To aid in this work, the proprietors of the Grove have erected a large and commodious assembly room, to which has been added two smaller and convenient rooms, as laboratory and working, or committee-rooms—to which will also be added a suitable museum building as soon as the collections may require such additional space.

The third annual session of the association was brought to a close on Monday last, after a continuance of two weeks, and is pronounced by those who have been present at all as the most interesting and fullest attended of the series. Lectures of an able and instructive character were given on various scientific and general subjects, among which were included astronomy, microscopy, biology, botany, entomology, physiology, conchology, etc. Among the lecturers may be enumerated Prof. Moses of the State University; Profs. Norton and Moore of the State Normal School; President Stratton of the University of the Pacific; Dr. J. H. Wythe of the Pacific Medical College; Miss Norton and Miss Washburn of the State Normal School; Mrs. Field of San Jose; Rev. C. V. Anthony of this city; Mr. F. B. Perkins of the San Francisco Free Library; Prof. Lemmon and Mrs. Lemmon, the well-known California botanists, and others.

The lectures averaged about three each day and were largely attended, not only by the members of the Association, but by large numbers who are constantly visiting this popular place of resort. In addition to the lectures, classes are also formed for practical instruction in the field, in botany, geology, etc., which are lead by thorough and competent instructors. We have no space in our columns to-day, to make special reference to any of these lectures, but may possibly allude to some one or more of them in future issues.

This Association has now put on the appearance of a permanent institution, as a summer school of science, and one that is likely to exert a great and growing influence on the growth of learning and social improvement throughout the State.

Extensive Prospecting Expedition.

We had in the early part of the week, the pleasure of a visit from Mr. Green Finnel, who took in Challis during a wide prospecting trip, which he is still pursuing with three companions. The party started from Salmon city early in May and passing over to the Montana side of the Rocky mountains, prospecting along to the eastward for a distance of some 80 miles, when they recrossed the mountains into Idaho and searched the country between the Medicine Lodge and Birch creeks. He describes the rocks of this region as greatly diversified, consisting of quartzite, lime, slate and porphyry. He pronounces the country very similar to that about Bay Horse and Kinnikinnic. The ores brought in, contain evidences of copper, and seem to be of the character known as copper silver glance. Others exhibited, evidently contain quantities of iron; but as none of them were assayed, we are unable to speak of their value. After leaving the ranges east of Birch creek, they crossed and gave the divide between that stream and Little Lost river a pretty thorough examination. The country formation here is described as being composed much the same as that on the east of Birch creek but with less porphyry. From this place the party left for the mining section on the head of the Pah-Simari.

We believe that a mixed formation, of varied rocks, is generally regarded by prospectors as favorable to the existence of mineral lodes and presume that others, following into this region, will make additional discoveries.—*Challis (Idaho) Messenger.*

Tides of Electricity.—Mr. Alex. Adams, one of the officers of the British Post-office Telegraph Department, has discovered the existence of electric tides in telegraph circuits. By long continued and careful observations he has determined distinct variations of strength in those earth currents, which are invariably present on all telegraph wires, following the different diurnal positions of the moon with respect to the earth.

The Engineer.

The Corinthian Canal.

French enterprise promises to undertake the accomplishment of a third great engineering feat in cutting a canal through the Isthmus of Corinth, which both in ancient and modern times, has formed an obstacle in the way of commerce between the Adriatic and the Ægean. General Turr, a well-known French geographer, has received a concession from the Greek government to carry out this design, and M. de Lesseps has promised such assistance as can be spared by one whose attention is monopolized by the more difficult and extensive scheme of Panama. When it is remembered how obvious the improvement effected by such a canal must at all ages have been to those enterprising peoples whose direct concern has been and still is the trade between the Adriatic and the Ægean and Black Seas, the only matter of surprise is that the operation has been so long deferred.

When the power of Corinth was at its prime, it was the one drawback to its happiness, the single element of weakness in its prosperity, that it was compelled to have two separate harbors—one for the Gulf and the other for the Ægean. With the view of mitigating, as far as possible, the inconveniences that arose from this circumstance, the Corinthians constructed across the isthmus a polished roadway, over which vessels could easily be hauled, and, from the purpose with which it was built, it was called the Diolcos After Corinth was destroyed by the Roman General Mummius (B.C. 145), and restored by Julius Cæsar, the Emperor Nero bestowed some notice on the once favored city, and devoted his attention to the question of cutting a canal through the isthmus. The ruins of the works which he caused to be erected are still shown.

It is said that Nero wished himself to strike the first blow, or as we should now say, lay the foundation stone; but a mutiny detained him in Rome. The work then languished, and either want of money, as reference to Suetonius would suggest, or the difficulty of piercing the hard rock led to the abandonment of the design. The Emperor Justinian, who was imitated at later periods by the Eastern Emperor Emanual, and also by the Venetians, erected fortifications across the isthmus, but no one attempted to renew Nero's abandoned canal. The fortifications did not avail to protect Corinth against either the Herulians or the Goths, whereas the canal would have added greatly to the welfare of that city and of the neighboring peoples. It is appropriate and auspicious that the formation of a modern Kingdom of Hellas should be so speedily followed by an attempt to perform one of the few tasks neglected by antiquity. With the cutting of a canal through the isthmus, more will have been done to restore the prosperity of Corinth than has been even so much as attempted since the age of the Cæsars.

The Water-way from the Lakes to the Mississippi.—A meeting will be held at Davenport, Iowa, July 25th, under the auspices of the Illinois and Mississippi River and Canal Improvement Commission, to consider and discuss the subject of a ship canal from somewhere near Chicago to a convenient point on the Mississippi river. It is not a wholly new scheme—about 20 years ago a grand national meeting was held in Chicago in this same interest, which was fully attended by competent delegates from all parts of the country. In the list of the probable attendants at the coming meeting are the names of many influential and well-known Western business men and politicians. The agricultural societies of many of the States will also be represented, as well as State Granges and like organizations.

Canal from the Black to the Caspian Seas.—The Russian engineers are renewing the project of a canal between the Black and Caspian seas, an idea which was formed in the times of "hoar antiquity." Plans for making a connection between the Volga and the Don were drawn up in the reign of Sultan Selim, and are preserved yet—somewhere. The great mass of water in the river Terek attracted the attention of M. Daniloff, the Russian engineer, owing to the great hight of the river, nearly 500 ft. above the level of the Black sea. The volume of water is from 175 to 554 cubic meters per second. Four branches will complete the junction of the Azof and the Caspian, and the Don and the Volga.

The Brooklyn Bridge.—At a recent meeting of the East River Bridge Commissioners, the President, Mr. Murphy, stated that the great structure would be finished within a year. The sum of $1,000,000 is required to complete the work, of which Brooklyn is to furnish two-thirds and New York one-third. The financial statement showed that on May 31st last, $13,009,315.20 had been received, and $12,884,437.23 expended since the work began, and there was $124,877.97 cash on hand, and liabilities of $85,155.08 outstanding.

The Denver and Rio Grande railway company are rushing their work in Colorado as well as in Utah. They have contracted for the grading of their short line from a point on the main line 17 miles south of Denver, to the South Fork of the Platte, on a water grade.

Useful Information.

Feather Cloth—How Made.

We have already, in these columns, alluded to the fact that a new and beautiful fabric has recently been introduced, made chiefly from feathers. The following from the *Textile Manufacturer*, tells us how it is made: The manufacture of feather cloth is not difficult, and the machines used in an ordinary woolen mill are suitable for the purpose with but slight modifications. When the down has been pulled off the feathers it is ready to be mixed with any textile material, such as cotton, silk, or wool, but the latter is the most suitable on account of its softness. Down may even be spun by itself, but this is seldom done. The mixture most to be recommended is 70 lbs. to 80 lbs. down, 100 lbs. to 120 lbs. skein, wool 40 lbs. to 60 lbs. To unite these three they are placed in alternate layers upon each other on a floor, and are then passed through a cock heel willy, making 400 to 500 turns per minute, and then brought to the scribbler. The main cylinder of this engine should run only about 35 to 45 revolutions per minute, instead of 100 to 110 as with pure wool. All rollers, clearers and doffer must be speeded in proportion. India rubber clothing is the best for this work, and must not be too fine, while the rollers should be set pretty close. When passing out of the scribbler the mixture is allowed to fall on the floor, and removed by a girl to the carding engine. In doing this the attendant examines the mixture a little to remove any whole feathers which may have passed.

The carding engine runs at the same speed as the scribbler, and is, in other respects, like it. The mixture does, however, not fall on the floor, but it passed on a sheet of cotton cloth, which is rolled up behind the engine, and rolls up the lap coming from it, so that the latter remains perfectly separated, and cannot be compressed.

A Substitute for Doors.—A new substitute for doors—hanging curtains—seems to be rapidly coming into vogue in New York, which is described as follows: This contrivance is more and more displacing doors in New York residences. Take down the door, and across the top of the doorway place a rod of wood. Black walnut or oak is best for the purpose, and there should be a knob at each end. The curtain is suspended by rings, which slide on the rod. Wooden rings are most fashionable, but metal will do, though noiser. Let the curtain be long enough to escape the floor by four or five inches, but fill out this space with a heavy upholstery fringe, sewed on the bottom. In that way you will have a good circulation of air, while the weight of the fringe, will keep the curtain from blowing out too fully for purposes of privacy. The curtain may be of medium light weight, but it should be either lined or doubled; also decorated with embroidery or bands of material contrasting in color with that of the curtain itself; or it may be adorned with both hands and embroidery. You can, if so disposed, put on other decorations in the form of embroidered sunflowers, cat-tail grasses, club ruches, poppies, palms, or any other device that you may choose. You may even aspire successfully to a pair of long-legged cranes. The cost of cotton plush, imitation tapestry, and two strips of cloth will be about $10 for a double doorway of ordinary size. Plain canton flannel would reduce the expense to half that. An entrance-way of this description dresses a room wonderfully.

Greek Honey.—The most celebrated honey of Greece is the Hymettian honey, also called Thymari honey, because it has the flavor of thyme, which grows plentifully upon and about Mount Hymettus in Attica, south of Athens. This honey was already celebrated in classic times, and has preserved its reputation to the present day. It is exported to England in tin cans. The common kind of honey is called Riki (from Erica), because domestic species of Eriea happen to be very common in localities where bee-culture is carried on, and their flowers are a great attraction to bees. Upon the island of Euboea, in mountain glens, near Karysto, there existed in former times large tracts covered with wild-growing roses and blackberries. The honey obtained from bees feeding upon the flowers of these plants had a peculiar and distinct odor of roses, and was known as rose-honey. But since those plants have been eradicated this kind of honey has ceased to exist. Honey is usually put up in goatskins and sold at the rate of about 20 cents the okka; in good years even for less.—*New Rem.*

Silvering Mixture.—A German scientific journal furnishes the following process for the instantaneous coating of copper or brass objects with silver without difficulty: Mix 3 parts of chloride of silver with 20 parts of powdered cream of tartar and 15 parts of powdered common salt. Moisten a suitable quantity of the mixture with water, and rub it with a piece of blotting paper upon the metallic object, which must be thoroughly clean. The latter is afterward rubbed with a piece of cotton upon which precipitated chalk is dusted, then washed with water and polished with a dry cloth.

There is a genuine mistletoe on a pear tree in the orchard of Robert Fulkerson, near Santa Rosa—something that is believed to be without precedent heretofore.

A Simple Method for Toughening Glass, says a Leipsic paper, is to place the article in a suitable iron pot, which is then to be filled with cold water, enough common salt being added to form a saturated solution. The whole should next be gradually raised to the boiling point and kept there for at least 20 minutes; the pot and contents may then be taken off the fire, etc., and allowed to cool down very slowly—preferably by burying in sand. When the articles are eventually taken and cleaned it will be found that they will resist blows and changes of temperature far better than they did previously.

Glass Weaving, according to report, seems to be gradually working its way into practical value. We have, from time to time, for several years, heard of experimental efforts in the production of articles of dress or domestic use from woven glass, but now we read that a Pittsburg firm is manufacturing fabrics that are strong, cannot be ripped or torn, and are cheaper than those woven from linen, cotton or silk. A large tablecloth of variegated colors, with ornamental borders and fringed edges, is on exhibition in New York city, which can be washed and ironed like the ordinary articles.

To Remove Mortar Stains from Bricks.—Bricklayers make use of spirits of turpentine, and also of vinegar, for the purpose of removing mortar stains from pressed brick fronts, the materials being carefully applied with a sponge or rag. Any acid, applied in the above manner, in very dilute form, would answer the purpose. Vinegar being a very dilute acetic acid, is probably as good a recipe as can be given.

To Clean Preserve Jars.—Sweetmeat jars or bottles may be cleaned without scraping them, by pouring into the jars hot water and a teaspoonful or two of pearlash. The contents which remain sticking to the sides and bottom of the jar will be disengaged by the pearlash and float loose in the water.

Hard or Soft Water.—To ascertain if water is hard or soft, procure a small quantity of soap dissolved in alcohol, and let a few drops of it fall into a glass of the water to be tried; if the water becomes milky it is hard; but if little or no milkiness results, the water may be said to be soft.

Good Health.

Starvation by Cookery.

[Written for the Press by Sanitas.]

Starvation by cookery is, I believe, chiefly a modern sin, and less the fault of the cook than of the public. Cooking is for man a necessity and quite a saving of vital energy. For, were it not for the cook, it would take so long for us to digest our food, that, like the cattle, we should have to spend half our time in eating, and the other half in resting that we might digest it. But while our best and our daily thanks are due the cook, it is high time that he or she give up kitchen hypocrisy, and send no more to our tables things having the appearance, but lacking the reality of food. I wonder how many die of hypocritical cooking? Perhaps half of us; for while gluttony and other sins cause much disease, yet were our food real, we might the better resist their temptations and suffer less by transgression.

But we must hurry up and not keep the cook in suspense as to the charge against him, which is briefly this: that he or she removes the natural salts from our food, and hides the loss by common salt, which, far from replacing them, rather aggravates the vital failure that comes from saline starvation. Not that common salt is bad of itself; it, too, has its uses in food.

Whilst this spoliation of food has been frequently complained of, and protest made against it by health reformers, it is only of late years that pointed evidence of the nature and extent of the danger has come to light. Degeneration of various tissues and organs in the body has long been recognized as the source of nearly all chronic disease and the fertile cause of that lack of stamina or endurance that characterizes modern life. Those in whom there is much degeneration, say the kidneys or the liver must walk through life gently; like a shoddy garment, they are safe enough for *careful* wear, but sure to give way under any strain.

The causes of the various types of degeneration have hitherto been very obscure, but one type has proved, on analysis, to be simply such tissue as the body can make in the absence of potassium and phosphates. This discovery of Dr. Dickinson's, of de-alkalized fibrine, as he calls it, is a startling one. This tissue has an excess of common salt; but, as compared with the natural tissue, which it has replaced, it is exceedingly poor in just those food salts which our cook does not send up to our tables. Every tissue in the body has a certain length of existence, after which it dies and is replaced. But this only slowly and cell by cell, fiber by fiber. To make each tissue capable of all the various services demanded of it, requires not only nitrogenous and carbonaceous foods, but also those saline elements that are so abundant in milk, vegetables and fruits. Sailors, it is well known, cannot undertake a long voyage without a daily supply of lemon juice or preserved vegetables, otherwise the terrible scurvy will disable or kill them. Scurvy is the acute disease due to this saline-starvation; whilst waxy degeneration is the chronic disease due to a less violent and more prolonged starvation from the same elements.

It is estimated that man requires 40 grains daily of potassium oxide to carry on the nutrition and health of the body; but few of the working classes in our large cities get more than 25 to 30 grains per day. For instance, white bread, of which many consume a pound daily, furnishes only 7 grains of potassium, whereas the same amount of Graham or brown bread contains 25. Again, the salt pork, salt fish or ham which forms their staple meat, has lost most of the potassium to the brine, or will lose it (like salt fish) in the washing and steeping it undergoes before cooking.

Even the wealthier classes, with all their abundance, have been, by our modern habits of food and cookery, reduced to about the minimum quantity of potassium, and every little strain, as well as every little error, hastens on the decline of life and the day of physiological fatigue. Potatoes are rich in potash, but should our cook first peel and steep them in cold water to whiten them before boiling, we are cheated in every 8 ounces we eat of 9 grains of potash; for boiled in their skins, 20 grains, instead of 11, would have come to table. Should we partake of cabbage the loss is still greater, because the leafy vegetable presents such an extended surface to the water. Again, corn-starch pudding is also an emasculated food, all the potash, nitrogenous and tissue-building matters having been removed in the manufacture, leaving pure starch, the most deceitful of all foods.

These losses of potash are small, but so numerous, repeated and constant that the poor body is often at its wits' end to replace the cells and fibers of each tissue as the old cells die out. So, cell by cell, fiber by fiber, our livers and blood vessels are rebuilt of shoddy—of de-alkalized fibrine—a substance that, while able to keep up the form and movements of the liver, is totally unable to perform its functions of digestion and of blood depuration. So we are slowly crippled in our vital power, and especially in our ability to endure fatigue and to recover from disease or other unusual strain. At the same time our blood is imperfectly purified; it circulates imperfectly digested food and effete matters that would have been expelled had our food been natural. These degraded matters irritate the brain, making us nervous and excitable; they weary the muscles, making us easily fatigued, and they render us more liable to rheumatic and inflammatory diseases.

Dentists, too, have attributed to this spoliation of food the toothlessness of this generation. White bread and corn-starch were not common foods to our ancestors. And 50 years ago, vegetables were more commonly cooked in soups or broths, which gave us all the good they contain.

But not every person suffers equally from this waste of food salines. Out of 100 sailors on board a scurvy-stricken ship, 10 or 20 may escape the worst features of the disease. The causes of such individual peculiarities are beyond our skill. Why, out of 20 equally exposed to the contagion of small-pox only 15 should take the disease, is a mystery. Or, why again, in a family, where, as regards heredity, habits and food, all the children are equal, why should one or two escape, whilst the majority suffer from an epidemic of scarlet fever? Echo answers, why?

Those, then, who desire that they and their children should walk this world in no shoddy suits of flesh and blood, should inherit no sham teeth, no feeble livers and no languid limbs, must, in two respects at least, return to the ways of their fathers. First, Graham bread must entirely replace white bread; and secondly, soups rich in vegetables must be freely used. Clear soups are, of course, inferior, but still there is less waste in rejecting the boiled vegetable itself, than in rejecting the clear soup it was boiled in. Potatoes, beans and peas form a good basis for soups, being all rich in potash as well as in the more solid constituents of food.

Physicians, especially in the army, are well aware of the wonderful power of potassium salts to remove fatigue and exhaustion, and frequently, on a march, serve out a ration of special soup or Liebig's extract of meat for this quality of their potassium salts.

Santa Rosa, Cal.

Causes of Pimples.—Pimples are occasioned by the torpid state of the skin, or, in other words, by the inability of the skin to perform its proper functions. The cause of these pimples is, therefore, neither more nor less than an obstruction of the pores of the skin; the perspiration being allowed to accumulate, the mouths of the pores become clogged, irritation ensues and a pimple arises. The only way to be rid of them is to allow the skin to do its own work by preserving it in a healthy condition and keeping the system in good order. The following ointment is recommended: Take an ounce of barley meal (the finer the better), one ounce of powdered bitter almonds and a sufficient quantity of honey to make them into a smooth paste. If you are taking medicine for the blood adopt our advice and place yourself in the hands of a competent physician.

Go to a Doctor.—A correspondent asks us to prescribe in an extreme case of chronic catarrh. We cannot assure the responsibility, and notwithstanding you have had much experience in that direction, we would still say—consult some good physician.

MINING AND SCIENTIFIC PRESS.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Foundry Notes; Notes on the Assay Spitzlutte; Academy of Sciences; 49. Passing Events; Utilization of Sulphurets; Contribution to the Geology of California; The Coming Fair, 56. The Comet; Effect of Cold on Giant Powder; Tension Apparatus for Cable Railways; Pure and Impure Water, 57.

ILLUSTRATIONS.—An Assay Spitzlute for Mining Laboratories, 49. Furnace for Thawing Giant Powder Cartridges, 57.

CORRESPONDENCE.—Amador County Mines, 50.

MECHANICAL PROGRESS.—Pickling Castings; Wet Peat for Steam Fuel; Holding Power of Steam Tubes; Steel Belting; Artificial Seasoning of Timber; Malleable Castings; New Steam Generator; Comparative Value of Steam Engines; How Made, 51.

SCIENTIFIC PROGRESS.—Color Relations of Metals; Rival Methods; Prehistoric Finds; Inflammability by the Action of Nitric Acid; On the Substitution of Oleomargarine for Butter; Bleaching by the Electric Light; Preservation of the Colors of Dried Plants, 51.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Dividends, 52.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Montana, Idaho, Oregon, and New Mexico, 52-3.

GOOD HEALTH.—Starvation by Cookery; Causes of Pimples; Go to a Doctor, 55.

NEWS IN BRIEF, on page 60 and other pages.

Business Announcements.

Well Augers—Loomis & Nyman, Tiffin, Ohio.
Tonite Powder Company, S. F.

Passing Events.

This week has been rather an eventless one from a miner's point of view. While steady work is going on in all quarters of the coast, the hydraulic mining regions of this State are at a standstill, owing to the unfortunate litigation, and the existing injunction against the hydraulic miners. The companies in Nevada county have petitioned the Board of Supervisors to reduce their assessments 66⅔%, and testimony adduced shows that the depreciation is even greater than that. The assessment of the county will be reduced from $9,000,000 to $,5-000,000.

As an evidence of the advance of quartz mining interests, our foundries are busy on mining machinery, and are shipping more or less all the time. A noticeable feature is the coming to the front of localities where lead and copper predominate, such as at Wood River, Idaho, and some parts of Arizona. The experience of Eureka with lead ores, and of such camps as Bisbee with copper, ought to be sufficient to show that there is great profit in this kind of mining. People who have sulphur mines ought to do well with them, as the product is scarce and in demand.

We bring to the attention of miners this week a means for the utilization of their sulphurets, and those who own sulphuret mines may now have a chance of realizing something out of their ore.

News from the Harrisburg mines, at Alaska, are to the effect that very little work has been done on the ledges, but the prospects look better than ever; the ledges showing up well and having every appearance of being solid and permanent placer mines. The Paris company shipped 95 ounces, and the Nady bullion company 60 ounces, being their clean-up since the last steamer. The hills are full of prospectors, many having gone far into the interior. New locations and discoveries have been made, but none of any great value.

As far as California is concerned, there are now more prospectors at work in the mountains of the southern part of the State, Mono, Inyo and San Bernardino counties, than elsewhere. Along the borders of the State line seems a favorite locality just now.

Utilization of Sulphurets.

A recent visit to the new works of the Safety Nitro Co., at Pinole Point, San Francisco bay, developed some facts of interest to the mining community, in the matter of the utilization of sulphurets; and this, aside from the other subject of interest, a new and powerful explosive, to which we shall allude more fully on a future occasion.

This company have erected extensive works with all modern appliances, for the manufacture of sulphuric and nitric acid, which they carry on in connection with the manufacture of their powder. They now purchase what sulphur they can buy here, but are compelled to buy from Japan and elsewhere, owing to the scarcity of sulphur on this coast. For this sulphur they pay from $25 to $35 per ton. They intend, however, to utilize the sulphurets from the mines for the supply of sulphur, and have this week closed a contract for 1,000 tons. They stand ready to purchase sulphurets in quantity, paying for them in accordance with their value.

It will probably interest some miners to know exactly how these sulphurets are to be utilized, and to explain this it will be necessary to explain briefly the process of manufacture of acids at the works in question.

The grounds of the company are quite extensive, comprising some 320 acres, the various buildings being arranged at distances apart, in a manner to prevent accident, and also to begin with the crude material near the water, where the landing wharf is, and to pack the finished product near the railroad, whence it is shipped. The acid works are, therefore, near the water, on the north side of Pinole Point, the warehouse for the powder being nearly a mile away, the other side of the hill.

There are two or three acid works on this coast now, but this will be one of the greatest capacity when entirely finished.

A two-story building, 100 ft. long and 60 ft. wide, contains the furnaces and acid chambers. There are four furnaces leading into a large dome or sort of combustion chamber, into which the combustion of the sulphur is completed. It stands up some 15 ft., so as to allow a thorough mixture of air with the gas before it goes into the condensing chamber, thus facilitating the progress of the work, and preventing the sulphur from subliming, or precipitating, in the lead chamber. This also facilitates the formation of strong acid in the first chamber and economizes chamber room.

There are iron pans on the bottom of these four furnaces, into which the sulphur is placed and where it melts, since here the sulphurous acid is formed. Steam and nitric acid are needed to convert it into sulphuric acid. In order to accomplish this, round iron pots, filled with niter (and a little sulphuric acid to decompose said niter), are placed in the furnace, and the heat of the burning sulphur distils off nitric acid, which decomposes into nitrous acid, and passes over into the lead chamber with the sulphurous acid, where it becomes nitric acid again. Steam from the boilers is admitted into the lead chambers.

There are two large chambers, each quite high and 63 ft. long by 20 wide, formed entirely of large sheets of lead melted together at the edges by means of a mechanical blowpipe. There are several tons of lead in this chamber supplied by the Selby Lead company of this city. In the bottom of each chamber is a certain amount of water, and the moisture in the chamber and the presence of the nitrous fumes together convert the sulphurous fumes into sulphuric acid.

It takes about two weeks to fill the two chambers with acid, and the daily capacity of the works is from 10,000 to 12,000 lbs. of acid per day.

Those gases which are not condensed in the first lead chamber, are taken into the second, where a further condensation takes place. There is also still another chamber, in the form of a large pipe, 75 ft. long, which further economizes the process.

The fumes that pass off here go up a stack or chimney 70 ft. high. There is scarcely anything passes out of it, slight white fume alone showing that a residue passes over. Being near the water the prevailing winds blow what little there is into the bay.

The sulphuric acid is drawn off by pipes into another furnace, while still hot. This furnace is built lower than the chambers (which are in an upper story) and is in another building near by. A steady stream of acid runs from the chambers through this furnace, and here it gets its first condensation. The furnace is covered with two coats of lead, one three-quarters and the other one-half inch thick. The acid flows in a sheet down this, and the flame of the furnace passes up over it in the opposite direction.

From here the acid flows on into a pan on top of the concentrating range in the concentrating house. In this house, which is about 24x60, are the retort furnaces, with 12 large glass retorts, each with a capacity of two carboys of about 300 lbs. each. In the pan on top the acid is kept hot with the waste heat from the retort furnaces, and is drawn hot into the retorts and boiled day and night until it is fully concentrated. It is brought to 66° Beaume, which is pure sulphuric acid.

From the retorts it runs by pipe to another house where nitric acid is made. To do this the acid is drawn on to niter in iron retorts and a fire built; the fumes of the mixture, condensed, form nitric acid. The sulphuric acid alone is drawn from the glass retorts, cooled, and put into carboys for shipment.

This in brief is the manufacture of sulphuric and nitric acid. This company use a large amount of nitric acid in manufacturing nitroglycerine for their powder. The consumption of acid on this coast is very large, and is increasing. This increase is due partly to the greatly increased consumption of powder; to the increase of export; and also to the fact that many chemical manufactures have of late started up which we never had here before.

Now the most important feature of this whole matter to the miner is the fact that he can utilize his sulphurets. There are thousands and thousands of tons of these troublesome little minerals, lying on the dumps of various mines about the country. Miners have been waiting for a process to work them cheaply, but in default of this apparently impossible thing, it behooves them to utilize them in the next best way—sell to some one who can use them.

In using the sulphurets for the manufacture of acid, the Safety Nitro Co. get the sulphur and use that, and also get a portion of the precious contents. This helps them and helps the miner too. They sell the powder to the miners and buy their sulphurets in return. The only difficulty so far has been they have not been able to get a sufficient supply, that is the sulphurets are not offered in sufficient quantities.

The company have acids for chlorination, and can utilize the residue after sulphurets are burned. By having the acid and no freight to pay on it (which is very high), they can work the sulphurets that others cannot work.

Contribution to the Geology of California

New Series.—No. 3.

Coulterville to Chinese Camp.

H. G. HANKS STATE, MINERALOGIST: Leaving for the present a notice in detail of the mother vein, we follow its course approximately to Chinese Camp, near Sonora, in Tuolumne county.

First, however, let me correct a slight typographical error in "Contribution No. 2." For "cinnabar slates" therein mentioned read "similar slates." The error is the more confusing, from the fact that cinnabar is actually found in one of the quartz veins of that region, associated with gold, a somewhat rare occurrence.

Coulterville to Priest's.

Crossing the line of the great vein at Coulterville, the road leads for a short distance over an outcrop of the heavy greenstone conglomerate, bordering the slates on the west. From that point to Priest's hotel, on the Yosemite road, a distance of 10 miles, the rock formations are entirely different from those of the valley, being granite and eyenite. The hills rise higher and the topography changes. The altitude at Coulterville is about 1,700 ft., and the road, upon the granite formation, is about 2,500 ft. Priests is between 2,300 and 2,400 ft. in altitude. The hills are but sparsely timbered and generally are wholly covered by a dense growth of chemisal. When this is in blossom, it never fails to remind one of the heather-covered downs of England, although it is comparatively gigantic in growth.

These high hills, which have been generally regarded as barren and worthless, are now being sought for and utilized for grain-growing and vineyards. Wherever water can be distributed over the surface, the granitic soil yields excellent crops of wheat. The vine takes kindly also to this soil and particularly where there is an excess of iron oxide, giving a red color to the earth. Probably the greenstone conglomerate hills are better than the granite. It is said that wherever the vines get well started they do not afterward require irrigation. The fact that these hills can be covered with vineyards is extremely important as greatly extending the area of the vine-producing region of the State.

About midway between the points mentioned, the syenitic granite gives way for a short distance to a thin belt of gneissic rock and a metamorphic slate. These formations are bordered by felsites, which, in decomposing, have formed banks and layers of kaolin, cut through by the graded road.

Near Priest's some gold-bearing quartz seams, or veins, have been found traversing the granite. These probably hold about the same relation to the veins of the slate belt as the veins in the granite at West Point, farther north, do to the veins in the slates of Amador county.

Slates at Priest's.

At Priest's we pass upon another and heavier belt of slaty rocks, which are more massive, harder, and appear older than the jurassic slates of Coulterville. This formation extends east and southeast from this point, and is probably the same body of hard black slates reaching southeast to Hite's cove and beyond, carrying the celebrated Hite vein and others. These slates are regularly stratified, and appear to be traversed by dykes of trap or greenstone.

Moccasin Creek.

From Priest's to the Tuolumne river at Stephen's bar the road leads in a northwesterly direction. The granite and syenite appear to thin out, for directly after leaving Priest's the greenstone conglomerate takes its place. The road descends rapidly between high chemisal covered hills, underlaid by the conglomerates, to Culbertson's in the valley, only a mile west of Priest's, and some 1,300 ft. lower.

At this point we are again upon the mother lode formation, and follow it down Moccasin creek to the Tuolumne. Looking back toward Coulterville, the view is interrupted by the peak of Penyon Blanco, the crest of which is formed by the massive blocks of white quartz of the mother vein. About Culbertson's the vein is split up, and does not come boldly to the surface. Lower down the valley it appears in the foothills on the right bank, and on the left bank there are heavy outcrops of serpentine, extending nearly to the Tuolumne, where the slates are found largely developed. The month of Moccasin creek is only about 700 ft. above tide. Running parallel as it does with the great vein for several miles, it might be expected to be rich in gold, which was the fact. It has been worked and reworked with profit, but now the gravelly bed is being leveled, and vineyards and orchards cover its surface and give a perpetual bonanza to the appreciative sons of Italy. The wonder is that more of our American young men and women do not avail of the many opportunities to make charming and profitable homes in the forsaken gold fields of California.

Tuolumne River and Jacksonville.

We cross the river in a boat and follow the left bank for about two miles to Jacksonville, noted years ago for its figs and oranges. The general direction of the river corresponds with the strike of the formations but it soon turns abruptly to the west and cuts across the slates and sandstones of the chief gold belt. Conglomerates and outcrops of serpentine with traces of the mother lode are also found, and these rocks continue, with a regular northwest trend, to Chinese Camp, eight miles southeast of Sonora. This place is situated in an open, gently rolling country, at an altitude of about 1,300 ft. Surface gold washings were very extensive in this vicinity, and sustained a large population of miners for years, but the diggings are now overgrown with grass, and many of the once well-filled stores are vacant.

WM. P. BLAKE.

The Coming Fair.

In a very short time now the exhibition of the Mechanics' Institute will open in this city. Already nearly all the floor space has been applied for by intending exhibitors, so that the success of the exhibition is assured. As applications for space still continue to come in, however, it will be as well for those intending to exhibit to begin to utilize their space as soon as possible, or they may not have as much as they want, as space will soon be in demand.

Every year, when the last days come, everything is in a rush, and every one is in a hurry. Exhibitors are tumbling over one another in their haste to arrange their booths or stands. Among them are a few calm and contented ones who, taking time by the forelock, have arranged their exhibits before the grand rush. We should like to see this small and select crowd larger this year. And above all things, we do hope that there will not be a lot of half completed booths on the opening night, with nothing to show to whom they belong.

These fairs have done a vast amount of good to this city and to this coast. They bring producer and consumer together on good terms. The manufacturer exhibits to the people among whom he lives and to whom he will sell his goods, and shows there his products in all their forms.

That these exhibitions are appreciated is evidenced by the crowds that attend them, and the very full exhibits made. This year we are more prosperous in this city and State than for sometime past, and the fair ought to excel preceding ones.

We particularly hope this year to see a full and complete exhibit of mining machinery. The Eastern States are now competing with us in this branch and endeavoring to get our trade. They have not been successful, nor is it likely they will. There are many appliances for mining and metallurgy made on this coast which have never been exhibited at any of our fairs. Concentrators, settlers, amalgamators of all kinds, pulverizers, crushers, sluices, riffles, etc., all at work in the fair building, would give people some idea of these sort of things. Most of them know what a stamp mill is, and that is all.

Judging from entries at present writing, and what is known to be forthcoming, a very large and varied exhibit of California products, natural and manufactured, will be made.

CHEMICALS IN AMALGAMATION.—The Tombstone *Epitaph* thus comments upon the change inaugurated by Prof. Church in the system of treating the Tombstone M. & M. Co's. ore. About six months ago he dropped out of use in amalgamation all chemicals, using quicksilver alone. Some of the "practical" millmen said it would prove a failure, predicting fouling and loss of quicksilver and a reduced percentage in the yield of the ore. The question has now passed beyond the experimental stage, and has become a demonstrated fact that his simple treatment is a perfect success in every way. For the month of May they extracted 84½% of the precious metal contained in the ore, and the bullion averaged 10% finer than in the previous month's work. The loss of quicksilver was also less per ton than heretofore.

The Comet.

At the last meeting of the Academy of Sciences, Prof. Davidson spoke at some length concerning the comet, giving many off-hand illustrations on the blackboard, describing his observations in detail. He said a few nights before June 24th, the comet at its lowest declination, passed below the horizon, hence arose the popular report that there were two comets. It really appears to circle around the north star, as our own sun appears at times to those within the Arctic circle. He had ascertained its right ascension within three to four-hundredths of a second by a transit instrument, and its declination by a 6½-inch equatorial telescope. He observed its physical characteristics under a power of 50 to 200 diameters. June 24th, it had a well-defined nucleus, whose disk was more sharply defined than the planet Uranus. At times there existed an abnormal and irregular refraction of the atmosphere. It first presented three beams of light radiating from the central nucleus to the inner rim of the outer envelope, having considerable luminosity between them, and casting a well-defined shadow. One side of the coma or tail, was brighter than the other. June 25th, the envelope was less light around the nucleus, and the peculiarities of its beams had changed. With the telescope he saw six small stars through the tail, and four or five beams of light radiated from its head. June 26th, these rays so multiplied as to set upon the comets head like an expanding crown. On a subsequent night, while its nucleus still continued well defined, it took a wholly different shape. All these rapid changes indicate an intense activity and altered its whole characteristics of the shadow. The phenomenon of two apparent envelopes of light was still maintained. The following night this segmental beam of light cast a shadow almost equal to the nucleus. July 8th, he found very unexpectedly that the first envelope was merging into the second, indicating a great abnormal change unlike any astronomical drawings known to him. Its tail, which had slightly exceeded 15°, had decreased nearly half a degree each night, but has retained a very fair nebulous form. For the last six or eight nights, however, he has detected no shadow, only a nebulous mass, and the breadth of its nucleus and coma or tail have each decreased, one side still appearing brightest. He used a Browning five prism spectroscope, whose use he illustrated. He found it impossible to fully determine whether the spectrum was homogeneous and the nucleus solid, or whether special lines crossed it, showing it to be incandescent or fluid, as the atmosphere around the observatory was too unsteady. Some indications appear to lead to a belief that parts of the spectrum observed may be influenced by reflected sunlight, and some broad lines at times visible, presented a spectrum like the hydro-carbons. Prof. Henry Draper says the light of the coma or tail, is from the nucleus or head itself, and is not reflected sunlight. He then illustrated the orbits of the meteoric showers through which the earth passes November 10th, 14th, and 27th. One of these goes beyond the planet Uranus, and has a period of 33 years, dating from about 1832. He gave the opinion of an eminent German astronomer, to whom was awarded the gold medal of the British Royal Astronomical Society, that these meteors were the waste particles thrown off by comets, and showed how he had demonstrated that these meteoric belts were on the exact courses of comets, whose spectrum revealed that they were composed of the same elements of the comets whose courses they occupied. When these meteors of various sizes strike our atmosphere they fuse from friction, and become very brilliant as they are rapidly melted, and drawn to the surface of the earth. Astronomers now think meteoric matter the debris of comets, who loose much matter continually on their course. The doctrine of a resisting medium of ether in space, outside of the atmosphere of planets has been exploded.

ADVICES from Bowie station, San Simon valley, Arizona, are to the effect that a very singular epidemic prevails among the workmen of the Bowie mill and mining company. The symptoms of the disease are peculiar pains in the throat, dizziness and nausea. A number were taken down about the same time, and one died before the informant left. It was first thought to be poisonous air in the shaft, which is 200 ft. deep, but later investigations seem to indicate that it is caused by the water used. It is believed that several others will die.

COPPER WORKS IN WALES.—In answer to an inquiry, "a correspondent" is informed that what is known as the Hafod Copper Works, comprise the great works of Vivian & Sons, Dellwyn & Co., Williams, Foster & Co., and others. In the neighborhood of Swansea, is also Greenfell & Sons' establishment. At Llanelly, Camarthonshire, are the fine works of Neville & Co., and at Pembrey are the works of Elkington & Co.

THE Wood River *Times* says that the miners of the region have no use for capital, intimating that the claims are rich enough to work themselves.

Effect of Cold on Giant Powder.

Giant powder freezes at about 44° Fahr., and gradually becomes hard, when it cannot be exploded with the Giant powder caps. When received at a mine and is not already frozen, it should be kept in some warm place, where it cannot freeze, to avoid the trouble of thawing it. When the powder is frozen it never should be used for blasting. The powder may be in a granulated state, apparently soft to the touch, and yet the nitro-glycerine (the explosive property of the powder) be so chilled that its strength is only partially developed by an explosion. Frozen powder, when confined in a drill hole, can be exploded by using a heavy primer of thoroughly thawed Giant powder No. 1. Knowing this fact, it is foolhardy for men to try to pick out a charge of frozen powder from a drill hole, as it is always more or less attended with danger.

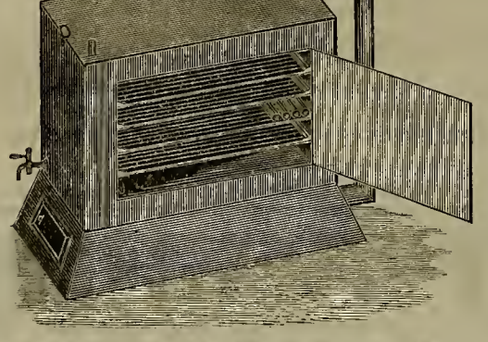
The Giant Powder Co. issue the following instructions as to the best methods of thawing the powder when frozen:

1. Put a layer of cartridges of frozen powder in a box partially filled with hot ashes, or sand, of about 100° Fahr., and cover them well with the same material. Many miners prefer this to any other method for thawing powder.

2. Put a layer of cartridges in a wooden box and place the box near the boiler in the hoisting works or mill, or other warm place, turning the cartridges, from time to time, until the powder becomes soft and warm. It is then ready for use. The warmer the powder is when used, the greater the execution of the blast. After being well thawed it should be used at once before getting cold again.

3. Miners, by placing several cartridges in their boot legs, when going to work, will find the natural warmth of their bodies sufficient to thaw the powder, while they are "striking in a hole."

4. During the winter months, keep the powder in a *warm*, dry room, on shelves or slats; when once thawed out, it will remain so.



FURNACE FOR THAWING FROZEN GIANT POWDER CARTRIDGES.

The latest improvement in this direction, however, we illustrate herewith. This is simply a jacketed chamber containing shelves on which the cartridges are laid, a small furnace underneath heating the water in the jacket. By this means the cartridges can never be heated above the boiling point of water, and there is no danger of explosion. The Giant Powder Company are now making these little furnaces for use at mines and on railroads. One large railroad in Oregon is now using some 50 of these thawing furnaces. They are easily carried along, and a fire can be built in them right where they stand, wherever that may happen to be. At mines the furnace could be placed in any convenient position.

A PAYING MINE.—The Eureka Consolidated mine at Eureka, Nevada, is a first-class mine. The net profit for the year ending February 28, 1881, was $1,142,000, or 87⅓% on the entire capital of the company. Out of this sum five dividends have been paid, amounting to $685,000, and $28,500 was paid in legal expenses and the purchase of other claims, the balance of the reserve fund, including what was carried over from last year, amounting to $75,000. The Directors, proposing to strengthen their working capital and carry a large reserve fund, will only pay out of this balance $250,000 in dividends. Fifty-one thousand two hundred and thirty-six tons of ore have been smelted during the year by the two large furnaces, of which 42,593 tons were raised from the Richmond mine, and 8,643 tons purchased, yielding with 153 tons of flue dust, 40,702 ounces of gold, 1,064,610 ounces of silver and 10,974 tons of lead. The total production of all the furnaces for the year was 47,546 ounces of gold, 1,285,325 ounces of silver and 12,596 tons of lead. The cost of mining and handling and all other general and working expenses at Eureka was $1,500,000 for the year. The average assay of ore was $68.12 per ton, as against $63.12 last year, while the working expenses of mining have been reduced from $11.02 to $9.58 per ton, and of smelting from $13.16 to $11.21 per ton, the net increase in profit for the year being $500,000. Sixty-three thousand seven hundred and two tons were smelted by the furnaces, or an average of 1,220 tons per week the year round.

Tension Apparatus for Cable Railways.

In the construction of railways in which cars are propelled upon a track by means of an endless cable moving in a tube beneath the surface of the ground, and connected with the cars by means of grips upon the cable, means must be provided to take up or compensate for the elongation of the cable which takes place in use. When the cables are of considerable length, the elongation is so considerable that, when ordinary means are employed, they are insufficient for the work, and the endless cable must be cut and a portion taken out, or it must be passed one or more times around a drum to take it up.

The usual method for keeping a tension upon the cable is to pass it around large pulleys at one or both ends, and these pulleys are mounted upon trucks. A chain passes from the rear and of the truck over a stationary pulley, and is attached to a heavy weight within the pit, and this produces the required tension. The cable soon stretches, however, so that the greatest depth of pit which can be conveniently used within a roadway is insufficient for the sinking of the weight, and the cable must be taken up, either by removing a portion or by taking one or more turns around the pulley. This process must be repeated, and causes delay and inconvenience.

Henry Root, Superintendent of the California St. Cable Railway Co., has designed and patented through the MINING AND SCIENTIFIC PRESS Patent Agency, an apparatus which answers as a perpetual compensator and tension apparatus, which may be adjusted without stoppage or delay.

It consists of a wheel grooved to receive the cable, this wheel having its shaft journaled in boxes upon the frame work of a car which is provided with wheels. These wheels are flanged and run on rails preferably set in line with the cable. A heavy chain or rope is secured to the rear end of the car and passes backward over a pulley and thence down to a weight sufficiently heavy to keep the necessary tension on the cable. The rails or timbers on which the wheels run are united to a frame work which rests upon long timbers, also set parallel with the line of rails.

Upon the upper surface of the lower timbers are formed strong racks, and the rear ends of the upper timbers have powerful hook pawls, which engage with the racks and thus hold the timbers at any desired point. In order to draw the timbers back when necessary, a powerful double block, with suitable ropes, connects the rear of the frame work with the masonry at the rear of the excavation. A gipsy is keyed to the shaft of the cable wheel, and the end of the rope is carried from the block to the gipsy, around which it may be passed a few turns, hanging loosely, so that the gipsy turns freely within it ordinarily.

When the cable is first put to work, the weight will be drawn up close to the frame-work, but as the cable stretches, the weight, keeping up the tension, gradually descends until it is at the bottom of the pit. It is then necessary to draw it up again. This is done by drawing upon the free end of the rope until it binds upon the gipsy, thus acting on the blocks and drawing the frame backward until the weight is close up to the pulley in the frame.

The hook pawls engage with the teeth of the jack and hold the movable frame in place. The tension is thus kept up, and the elongation of the cable is compensated without cutting it or having it turn about a drum; and when the weight has descended to the bottom it is at once raised again by the block and tackle without disturbing the cable.

The frame and rack may be of any desirable length, from 60 to 100 ft. long, depending on the length of cable running. The adjustment is thus made ample for any stretching of cable. At the ends of the roads the apparatus will be connected with the horizontal sheaves around which the cable passes.

MINERS' UNION ELECTION.—At their last meeting, the Virginia Miners' Union elected the following officers: President, M. Abrams; Vice-President, J. D. Cameron; Recording Secretary, Andy Young; Financial Secretary, John Ross; Treasurer, Denis Nevin. Trustees, A. J. Burns, Martin O'Shea, Richard Henderson, A. L. Day and Edward McDonald.

Industrial Items.

THE capital of a cotton mill near Boston has grown from $160,000 to $2,500,000 in 10 years.

A BOSTON man has invented a machine that manufactures seamless paper boxes at the rate of 20 per minute.

THE length of the railroads built in the United States in the year ending April 1, 1881, was 6,113 miles, twice the mileage of the preceding 12 months.

CAREFUL inquiry by the *Age of Steel*, published in St. Louis, refutes the statement that there is an over production of pig iron in America. All steel mills agree that they prefer American iron to the foreign.

A LARGE grain elevator about to go into operation in St. Louis will employ as elevating power three gas engines, which will be located in the cupola of the structure. The experiment will be watched with much interest.

THIRTY-NINE locomotives were shipped from the three locomotive works in Patterson, N. J., during the month of June. This number was never exceeded but once. The average weight of engines is constantly on the increase. Four of the locomotives were sent to Spain, being part of an order of 10, the first ever received in America from that country.

AMERICAN machine-made watches, which have driven the English and Swiss hand-made articles out of domestic markets, are now proving formidable competitors for the markets of the world. The Waltham Watch Co. now turn out 750 watches a day and employ 1,600 work people, the demands of their increasing foreign and domestic trade force them to enlarge their facilities. This is being done by replacing the older buildings with new and larger ones, whereby the force employed will be fully doubled. The increase being from about 1,000 employees to 2,000.

IN 1830 not a single locomotive engine had been built in America. The first two were brought from England that year. The number of locomotive engines in use January 1, 1879, was 16,445, valued at $164,450,000; the number of cars, including palace and freight cars, was about 300,000, which at a low estimate, would cost $60,000,000. About one-tenth of those now running must have been rebuilt probably five times, since 1830, at a cost of $382,225,000, making a total of $1,146,675,000, or about twice as much as England has invested in ships. Besides this, we have built locomotive engines for export to all parts of the world. Of all those used in the English colonies, from 95% to 99% were built in the United States. Since 1870 we have exported $25,000,000 in locomotive engines, and double that amount in cars.

Pure and Impure Water.

If there is any one subject connected with the household which requires more attention than another, it is that of pure water for man and beast. Every medical man knows that impure water is a fertile source of disease in human beings, and innumerable outbreaks of a typhoid nature have been distinctly traced to this cause. Many of the diseases in cattle have their origin from the impure water which they are compelled to drink. In many localities in this country a "mud hole" or "sink" filled with partly stagnant water is the only source of supply for farm animals during the long hot summer, and it is no wonder that diseases of various kinds follow such treatment.

There does not exist two sets of sanitary principles, one affecting human beings and the other the beasts of the field. Impure water, imperfect ventilation, dirt and damp, exercise injurious influences on the health of our domestic animals just as these agents do in the case of human beings. Every practical man should therefore seek to remove these sources of evil as speedily as possible.

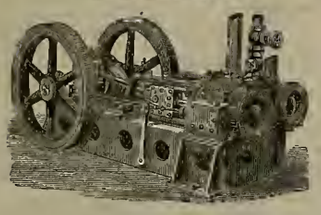
Machinery and tools for obtaining good pure water have, of late, been perfected and simplified, so that there is no reason why every man should not have an abundant supply, both for household and stock, no matter where he is. Thousands of large land owners would be justified in purchasing the necessary machinery and tools for prosecuting their own work in this direction; and people with small places in the country would find it to their interest were they to club together and purchase the necessary outfit for sinking wells convenient to house and field. In the cities there are men who sink these wells for a specified price per foot, where the geological peculiarities of the section are known.

THE repeal of the bullion tax by the last Legislative Assembly of Arizona, met with strong denunciation in many quarters. It is now promised that this question shall be a considerable factor in the next Territorial campaign. Party lines will be entirely obliterated in the contest. The county of Gila, by its Board of Supervisors, has already adopted resolutions looking to the re-establishment of the tax by the next Legislature.

THE Homer *Index* says that Joe Curtis's gravel prospects in the old Mono diggings are getting brighter and better every day. He already has uncovered a good bank of auriferous gravel, which is rapidly widening out.

INGERSOLL ROCK DRILL.

PRICES REDUCED.



Parties requiring Drills can get them at agents' rates by applying to

GEO. R. FOARD,

Sole Agent for Pacific Coast.

No. 18 First St., S. F.

The only Depot where Standard Drills and Duplicate Parts can be obtained.

Agent for PADDOCK'S Ore Dressing Machinery.

Mining Machinery supplied.

San Francisco Cordage Factory.

Established 1856.

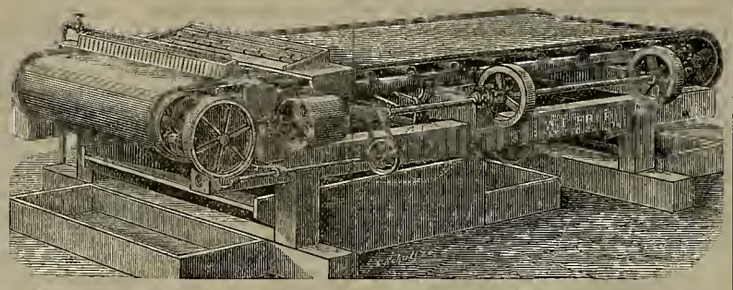
Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

TUBBS & CO.,

611 and 613 Front Street, San Francisco

$1,000 CHALLENCE!



THE FRUE ORE CONCENTRATOR.

Over 250 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and the concentrations are clean from the first working.

The wear and tear are merely nominal; the water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

ADAMS & CARTER, Agents, Room 7, No. 109 California Street, S. F.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,

SAN FRANCISCO, CAL.

Excelsior Blasting Powder,

—MANUFACTURED BY—

THE EXCELSIOR POWDER COMPANY.

This is no NEW PATENT NON-EXPLOSIVE SAFETY POWDER, but the GENUINE STANDARD ARTICLE, and as safe to use and handle as any Nitro-Glycerine Powder manufactured. The Fumes and Gases, common in other Nitro-Glycerine Powders, are almost destroyed, and do not leave the miner with headache or nausea. Among the numerous recent testimonials the following is but a fair sample, constantly received, attesting the superiority of EXCELSIOR POWDER:

AUBURN, Cal., May 26, 1881.—EXCELSIOR POWDER CO.: I send you per Wells, Fargo & Co., a box containing samples of country rock through which I am running our tunnel on the Conrad Mine, and through which we have now run 425 feet, 2.5 feet of it having been done with EXCELSIOR POWDER. If any one can produce harder rock I would like to see it. I here say that I can do more execution with your No. 2 Powder in this rock than I can with any No. 1 Powder of any manufacture I have ever used, and I have used every kind now manufactured here, excepting "Tonite," and I have had 20 years' experience in blasting. Respectfully yours,

E. W. ROBERTS, Superintendent.

Give this Powder a trial and you will use no other. For Strength and freedom from noxious fumes, it has no equal. Address all orders to EXCELSIOR POWDER CO., No. 330 Pine Street, Rooms 53 and 54, Academy Building, San Francisco, Cal.

VULCAN BLASTING POWDER.

—THE MOST ECONOMICAL AND BEST—

Nitro-Glycerine Explosive in the Market.

In the suit of the Giant Powder Co. against the Vulcan Powder Co. for *alleged* infringement of Patent, it was held that the Giant Powder Patent was INVALID.

Nos. 1, 2 and 3 Vulcan,

Each grade superior to like numbers of any other Nitro-Glycerine Powder in the market.

VULCAN B. B.,

Superior to Black, Judson or any low grade Powder for Bank Blasts, Railroad work, or any work where Black Powder has been heretofore employed.

TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.

The CONSUMER'S COMPANY sell the best Powder at the lowest rates.

SHINGLE MACHINES AND SAW MILL MACHINERY, STEAM ENGINES, ETC., TO ORDER. MINING MACHINERY OF ALL KINDS.

F. A. HUNTINGTON,

220 Fremont Street, San Francisco.

DuBOIS' Automatic Quicksilver Feeder.

A machine for feeding quicksilver to the mortare of GOLD MILLS. It is so connected to the cam shaft, that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a mechanical movement, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding ordinary hand-feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect. Price complete, $100.00. Send for circular.

244,147.—TENSION APPARATUS FOR CABLE R. R.—H. Root, S. F.

244,030.—COMPOSITION FOR DISSOLVING THE COATING OF GOLD IN ORE.—J. F. Sanders, Ogden, Utah.

234,098.—ORE FEEDER—Edward W. Wagner, Enterprise, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

TIMBER FRAMING MACHINE. — Isaac Lepley, Amador City. Dated July 12, 1881. No. 244,134. This is a novel method for framing timbers of all kinds, but is specially useful for mining work. It consists in the employment of cutter-heads, which are caused to rotate upon a suitable frame, and this frame is moved both vertically and horizontally by means of slides and guides, so that the cutters may be carried across the timber upon either or all four sides to form a tenor, dove tail or other cut; and, if desired, a round tenor may be formed by the use of a link, which has one end fixed to the frame so that the slides will move in a manner to carry the tool around in a circle. This machine was described and illustrated in detail in the MINING AND SCIENTIFIC PRESS of January 22, 1881.

STEAM WAGON.—Aug. H. Elfers, Bakersfield, Kern county. Dated July 12, 1881. No. 244,117. This invention relates to that class of wagons adapted for the use of steam as a motor. It would be difficult to describe the details without the use of engravings. The wagon, however, is so made as not to require a special engine. By making the crank adjustable it can be made to accommodate itself to the stroke of almost any engine, and hence a farmer who has already a steam threshing engine can use it to drive this wagon, by removing it from its own truck and placing it upon the wagon, and connecting its piston-rod with the driving shaft, and adjusting the crank to the stroke of the engine In order to reverse the engine and drive the wagon in an opposite direction a peculiar construction is adopted, whereby the inventor is enabled to do this with simply one eccentric, by changing the throw of said eccentric.

FEEDER FOR THRESHING MACHINES. — John Ransford, Stockton. Dated July 12, 1881. No. 244,144. This invention relates to certain improvements in the feeding device which supplies unthreshed straw to the cylinders of threshing engines. It consists in a series of notched inclined feeding timbers or arms, placed side by side, and operated by an eccentric or crank to give them a reciprocating motion. Each arm being provided with peculiarly constructed flanging forks, the upper ends of which push forward the mass of straw above, while the lower ends push that below and keep the spaces between the reciprocating arms clear. The position of the device with regard to the threshing cylinder must be determined by convenience. Generally, of course, it should be attached to the threshing machine, so that its reciprocating arms could feed the straw down to the front of the cylinder; but whether on top or toward its lower part must be decided by circumstances.

SACRAMENTO county has brought suit against the hydraulic miners for allowing their debris to flow into the rivers. It is daily becoming more apparent that the present strife between the farming and mining interests is being kept up through the influence of scheming lawyers and others who thus desire to obtain lucrative salaries for their services.

NEW ENGLANDERS are proverbially cautious about mines, but when the Boston *Economist* says, as it does in its issue of July 2d, that "there is no safer average investment to-day than in mines, provided it be made intelligently and with ordinary prudence and foresight," we may expect to see New England capital seeking investments in the mountain regions.

THE celebrated Mulatos gold mine, of Sonora, has been bonded for $2,000,000 by New York capitalists.

Our Home Industries.

The Mechanical and Manufacturing Interest of San Francisco.

The following facts and figures from the annual report of the Assessor to the Surveyor General, will show the statistical features of our home industries:

Artificial stone manufactories 2, men employed 124, value of manufactures $328,950.

Axle grease manufactories 2, men employed 11, value of manufactures $39,480.

Barrel manufactories 3, barrels made 356,291, men and boys employed 184, horse power of steam engines 80, barrels made for use of sugar refineries 76,650, syrup kegs made by tub and pail factories 13,650, value $221,550.

Bag manufactories 5, men, women and boys employed 284, number of bags manufactured 15,073,740, value $2,188,450.

Bed spring manufactories 3, men employed 28, copper wire used 583 tons, aggregate value manufactured $198,000.

Bedstead manufactories 5, men 264, lumber 440,000 ft., value of manufactures $143,000.

Bellows manufactories 2, men 12, bellows made 1,600, value of manufactures $32,000.

Bedding 7, men 341, value $819,000.

Billiard tables 3, men 20, tables made 127, value $28,000.

Boots and shoes 56, men, women and boys 2,430, value $1,508,000.

Box factories (wooden) 6, men 305, lumber 8,505,000 ft., value $957,600.

Box factories (paper) 5, men, women and boys 62, boxes made 689,500, value $46,200.

Box factories (cigar) 3, men, women and boys 140, boxes made 240,000, value $110,000.

Brass foundries 8, men 290, value of, including copper 500 tons, $510,000.

Breweries 43, men 356, hops 632,500 lbs., barley 26,450 tons, beer made 356,500 barrels, value $2,415,000.

Brooms 14, men 80, brooms 50,000 dozen, value $150,000.

Broom handles 2, men 10, handles made 800,000, value, $12,000.

Brush factories 3, men 34, value $79,200.

Candles 4, men 161, candles manufactured boxes 241,500, value $563,500.

Carriages and wagons 30, men 180, carriages and wagons made 500, railroad street cars and dummies 120, value $330,500.

Coffee and spice mills 16, coffee ground and roasted 5,700,000 lbs., chocolate 327,000 lbs., spices ground 500,000 lbs., value $1,167,000.

Corset factories 4, men and boys 20, value $15,000.

Coffins 4, men 32, value $115,500.

Cordage and rope 1, men 110, hemp rope 2,600 tons, value $560,000.

Clothing 12, men and women 4,830, value (including overalls, suits and underware) $3,662,500.

Cigar factories 200, men, women and boys 3,250, cigars 90,750,000, cigarettes 9,900,000.

Cement pipes 2, men 138, value $402,500.

Crackers 4, men 130, value $1,120,000.

Chemical works 2, men 53, value $520,000.

Carriage springs 1, men 17, springs made (tons) 130, value $60,000.

Cutlery 2, men 37, value $52,500.

Dry docks (floating) 2, men 15, capacity of docks (1.1800 tons, 1.800 tons) 2,600.

Dry docks (stone) 1, men 6, total cost of work $675,000.

Electric machinery works 2, men 45, capital $165,000.

Elevator manufactories 2, men 28, value $7,700.

Fringe factories 5, men and women 60, value $86,250,

Flour and feed mills 8, men 90, flour made (barrels) 204,000, hominy made (tons) 247, buckwheat and rye flour (tons) 385, oatmeal and groats (tons) 2,760, cornmeal and farina (tons) 3,960, feed barley (tons) 9,720, cracked wheat (tons) 864, split peas (tons) 636, graham flour (barrels) 6,360, cracked corn (tons) 732, ground feed (tons) 1,320, pearl barley (tons) 720, run of stone 52.

Foundries, boiler and iron works 15, men, 1,200, pig iron (tons) 18,270, bar iron used (tons) 16,250, rivets used (tons) 350, California iron used to June 30th (tons) 1,200, value, $3,120,000.

Fur manufactories 5, men and women 55, value $270,000.

Furniture manufactories 18, men 1,610, lumber used (ft.) 1,080,000, value $1,839,750.

Gas works 1, men employed (about) 400, capital stock $10,000,000.

Glass works 1, men and boys 180, furnaces 22, pots 7, value of manufactures $213,400.

Glass cutting 2, men 20, value of manufactures $55,000.

Gloves 20, men and women 207, value $180,000.

Glue 1, men 15, glue (tons) 150, neatsfoot oil (gallons) 6,500, value $100,000.

Gold refineries 1, men 50.

Gutta percha and rubber 2, men 11, value $17,200.

Hat and caps 18, men 192, value $342,000.

Hose and belting 5, men 19, hose 1,200 ft., belting 129,000 ft., value $150,000.

Harness 50, men 350, value $1,000,000.

Ink and mucilage 1, men 10, made annually, 10,050 dozen.

Ice manufactories 3, men 42, tons made 2,640, capital invested $108,000.

Japanning and galvanizing manufactories 2, men and boys 16, value $21,000.

Jewelry manufactories 16, men 168, value $552,000.

Lead and shot manufactory 1, men 140, lead pipe and shot made 4,700 tons, value $7,000.000.

Lead smelting works 1, men 116, value $760,000.

Last manufactories 2, men 11, lasts made 18,700, value $24,200.

Linseed oil works 2, men 60, oil cake 4,300 tons, capacity of works yearly 8,000,000 gallons, value of oil $580,000, value of cake $135,000.

Macaroni and vermicelli 6, men and boys 36, macaroni and paste made (boxes) 154,000, value $154,000

Marble works 22, men 253, value $632,500.

Matches 8, men 60, matches made gross 408,000, value $672.000.

Malt houses 6, men 58, grain malted tons 16,900, value $805,000.

Mirror manufactories 2, men 7, capital invested $172,500.

Musical instrument 2, men 16, value $10,000.

Oil clothing 4, value $11,000.

Oakum 1, men 21, bales made 10,500, value $42,000.

Pickle and fruit preserving 11, men and women 1,955, fruit and meats put up (dozen cans) 575,000, pickles put up in kegs 59,800, value $1,840,000.

Powder works 1, men 31, powder made 1,331,500, value $450,000.

Provisions packing 2, men 145, meats packed 8,500 barrels, pork 8,000 barrels, ham and bacon 2,500,000 lbs., lard 1,300,000 lbs., tallow 50,000 lbs., value of investment in real estate, fixtures, etc., $130,000, value of products, $1,450,000.

Pump manufactories 2, men 16, pumps made 380, value $90,000.

Rolling mill 1, men employed 319, scrap iron used 17,314 tons, coal consumed 11,660 tons, value $1,104,950.

Salt works 3, men employed 52, number of tons 19,550, value of salt ground $217,500.

Safe and vault works 1, men 20, value $30,000.

Saw manufactories 2, men 33, value $110,000.

Sash, blind and door 15, men 2,100, ft. of lumber consumed annually 11,050,000, value $5,040,000.

Silverware 3, men 50, value $150,000.

Shirt 3, men and women 1,100, value $500,000.

Slippers 25, men and women 1,000, value $470,000.

Soap 21, men 345, pounds soap made 25,200,000, value $2,735,500.

Sugar refineries 2, men 320, sugar (raw) used 80,560,000 lbs., white sugar made 29,550,000 lbs., yellow sugar made 31,880,000 lbs., syrup made 647,000 gallons, value $6,635,000.

Tanneries 43, men 380, bark used annually 5,860 cords, hides of all kinds 393,300, value $1,932,000.

Tool manufactories 11, men 79, value $50,000.

Type foundries 2, men and women 46, value $50,000.

Vinegar 2, men 20, vinegar made annually 24,000,000 gallons, value $180,000.

White lead 1, men employed 75, tons manufactured 2,400, capital employed $250,000.

Windmill manufactories 2, men 10, mills made 110, value $22,000.

Willow ware and baskets 2, men 8, value $6,000.

Wine casks 1, men 210, casks made 3,800, value $84,000.

Woolen mills 2, men and women 819, blankets made annually (pairs) 93,600, hosiery (dozens) 14,040, wool used (lbs.) 3,000,000, cloth and tweed (yarde made) 702,000, flannels (yards made) 800,000, value $1,755,000.

Wire rope 1, men 46, amount of wire consumed (tons) 600, value $320,000.

Wire works 2, men 48, value $75,000.

EMPLOYEES OF MECHANICS' FAIR. — At a meeting of the Board of Managers of the fair, held this week, the following employees were appointed to serve during the fair: Day sergeant of the watch, T. S. Tweedale; assistant, William Moore; night sergeant, H. L. Baker; watchmen, T. Olvaney, Wm. Lyman, J. Mulcahey, O. Langley, J. L. Mason, J. Greer, H. Aeh, G. S. Dougherty, C. H. Warren, T. Tweedale, J. Mann, J. Rainford, H. Savage, F. Johnson, J. Mulligan, J. Flaherty, D. O'Connor; gas inspector, S. N. Grubb; engineer, J. C. Holmes; carpenter, A. J. Beacher; gardener, T. Sagwell; sanitary inspector, C. Orth; messenger, J. Evatt; ladies' room, Mrs. Platt; cloak room, Mrs. Lawson; ticket office, J. Hobe, J. Feldbush and Mrs. Allen; doorkeepers, George Haman, J. McLeay, A. Lyon, H. Hotchkiss and D. Pratt. It was decided to have an illuminated waterfall and a prismatic fountain among the other novelties, to add to the attractions of the fair.

IMPOUNDING DEBRIS.—Mr. O'Brien, Superintendent of the mines at Smartsville, is now building dame at the mouths of some of the ravines to hold back the tailings, so far as possible, and prevent injury below, should the injunction be dissolved so that the mines can be worked. Owners of other mines are moving in the same direction, with a view to prevent, if possible, injury to the country below, and still continue the working of the mines.

THE Wood River *News* says that the importance of the Hood mining district of late has suggested metropolitan ideas, and now they have surveyed a town site near Champagne & Norris' old station, which they have dubbed Springer. It is a good location, convenient to wood and water; and if the mines there are placed in the hands of capitalists, will prove a live town before snow flies.

News in Brief.

DEAN STANLEY is dead.

BOTH London and Paris are at present afflicted with a bad hot spell.

THREE comets are said to be visible every night at Guaymas, Mexico.

SALMON are now running in all the rivers of British Columbia in large numbers.

SIR EVELYN WOOD is to be raised to the peerage for his services in the Transvaal.

SAMUEL BRANNAN is having trouble with the Mexican authorities in regard to his land grant.

HESSY HELFMANN'S death sentence has been commuted to imprisonment, for what term is not stated.

THE President continues to improve, and it is now confidently believed that the danger line has been crossed.

THE Secretary of the Treasury has presented Ida Lewis with the gold life saving medal, authorized by act of Congress.

THE different Atlantic cable companies have given notice that they will reduce their rate to 25 cents per word after August 1st next.

A LONDON, Ontario, dispatch says the Captain and Superintendent of the ill-fated Victoria have been committed for trial at the Assizes.

FIFTEEN HUNDRED laboring men in the logging camps of Wisconsin are out on a strike for 10 hours, instead of 11 and 12 hours service per day.

A ST. PETERSBURG dispatch says: General Ignatieff recently received several threatening letters, purporting to come from the Nihilists.

MARTIN MURPHY and wife, who came to California in 1844, on Monday celebrated their golden wedding at Mountain View, Santa Clara county, in grand style.

THE track of the recent cyclone in Minnesota is 40 miles long by one mile wide Several lives were lost, and the property damage is estimated at $300,000.

THE London *Morning Post* hints that the protective tariff of the United States and other countries renders retaliation duties necessary on the part of England.

A LARGE meeting of Turkish bondholders in London has formally requested the former Under Foreign Secretary (Bourke) to go to Constantinople to arrange the Turkish debt.

A VIENNA dispatch says: Chimerical as it may seem, the Berlin and Vienna foreign officers are seeking to effect a political and trade alliance between France, Austria and Germany.

IN the rifle match at Wimbledon between the Lords and the Commons, at a single range of 50 yards, the Lords scored 440 and the Commons 393.

IN shooting for the international trophy on Saturday, at Wimbledon, the grand total scores were as follows: Scotland, 1,774; Wales, 1,086; Ireland, 1,642. Twenty competitors were in each team.

BILLY THE KID, the notorious murderer and outlaw, who for several years has been the terror of New Mexico cattle men, was on the 14th inst. killed by Patrick Garrell, Sheriff of Lincoln county.

SEVERAL Mexican Custom-House officers in attempting to arrest some smugglers were disarmed and tied to trees, where they remained for two days, until rescued by some friendly Papagos.

AFTER two years' labor, the fire in the Stanton shaft, Wilkesbare, Penn., has been subdued. The work of repairing the immense destruction caused by the water and flames is now being vigorously pushed forward.

DON CARLOS, the Spanish pretender, has been ordered to quit France. It is stated that he has been engaged in certain proceedings which are regarded as a manifestation against the present form of government in France.

A LAW student in the University of Bonn has just been killed in a duel, and another student is in the hospital hopelessly wounded. A student in Berlin a few days ago had his nose slashed nearly off. Scarcely a week passes but we hear of some such brutality.

THE agricultural laborers in many parts of Cork are dissatisfied at deriving no benefit from the improved circumstances of farmers consequent on the payment of reduced rents, and contemplate striking for higher wages during the harvest. The movement is fast gaining ground.

STATISTICS published by the Hamburg police authorities, show the number of German emigrants passing through Hamburg alone to America, from January 1, 1881, to June 30th, 1881, amounted to 74,633. If emigration proceeded in the same proportion the government will find that, reckoning fugitives by other channels, it has lost in 1881 about a quarter of a million of its subjects.

IT is stated that France has made a treaty with the chief of the Amados in Senegal for the exclusive right to found and open roads to the Niger. Segoo will be placed under a French protectorate, and a French resident will be stationed there. It is intended to build a railway up the valley of the Senegal toward Bamakoo on the Niger, in order to establish communication with Upper Soudan.

THE latest estimates of the harvest in Hungary agree that the yield of wheat will be much larger and of better quality than last year. Reports from Russia state that the yield will be excellent. Roumanian grain crops are much damaged by spring rains and storms. Reports from France show that the harvest, with few exceptions, will be excellent,

Mechanics' Fair Daily.

"A Valuable Publication."

BY AUTHORITY OF BOARD OF MANAGERS OF THE MECHANICS' INSTITUTE FAIR FOR 1881.

During the season, the MECHANICS' FAIR DAILY is the BEST AND MOST IMPORTANT ADVERTISING MEDIUM IN SAN FRANCISCO. While open, the Fair is THE LEADING ATTRACTION with both residents and visitors from abroad. Thousands attend daily, seeking and obtaining information. While thus in an investigating mood, the "great public" are more ready than at other times to receive evidences of the superiority of goods and inventions, and the claims and advantages offered by professional and active business men.

The DAILY will be printed on superior California made paper, in the presence of THOUSANDS OF VISITORS during every evening of the exhibitions, and DISTRIBUTED FREE, "fresh from the press," in IMMENSE NUMBERS.

This is our 12th volume. It will be well illustrated, spicily and ably edited, and, like all preceding volumes, it cannot fail of being EXCEEDINGLY POPULAR WITH OVER **100,000** EXHIBITORS AND VISITORS, and EXTRAORDINARILY PROFITABLE to advertisers in its columns. Our most enterprising, first-class business representatives will continue its principal patrons.

The DAILY possesses continuously a great advantage over all other desirable periodicals, from having, in large numbers, a new set of readers for each issue, aggregating an immense number from the most thrifty and intelligent portion of the community. Receiving it somewhat as a novelty, they are likely to peruse its entire contents; pass it around the home circle, and frequently send it to interested parties elsewhere.

Advertisements will be received at reasonable rates. It will be of advantage to patrons to secure the spaces wanted without delay.

Advertisements will be received by the publishers through telephone (No. 75) or we will send our business representative on request by telephone or postal card.

N. B.—The only official Catalogue of the Fair, during the exhibition, will be published complete in the columns of the FAIR DAILY, under authority of the Board of Managers.

DEWEY & CO., PUBLISHERS.

MINING AND SCIENTIFIC PRESS Office No. 202 Sansome Street, S. F.

P. S.—None but our firm has a right to contract for and publish, post, or circulate, in or about the fair, the advertisement of a second or a third party. Having paid (to the welfare of the Mechanics' Institute), for this privilege, we shall maintain our rights, under our contract with the Board of Managers, for the protection and benefit of all our patrons in the FAIR DAILY. Solicitors for advertisements to be circulated in the fair, without our authority, should be avoided by business men for their own benefit.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. F. OSBORNE—San Francisco.
G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Yuba and Sutter counties.
D. W. KELLEHER—Napa, Nevada and Placer counties.
GEO. H. HOPKINS—Amador county.
A. LEONARD MEYER—Utah and Idaho Ter.
C. E. WETMORE—Alameda county.
J. M. WOLFE—California.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

THE 16th INDUSTRIAL EXHIBITION
OF THE
MECHANICS' INSTITUTE
OF SAN FRANCISCO,

Will Open Tuesday, August 2, 1881.

Board of Managers.

P. B. CORNWALL, Pres't,	A. W. STARBIRD, Vice Pres't,
J. A. BAUER, Treasurer,	DAVID KERR,
RICHARD GRAY,	SAMUEL DINSMORE,
C. WATERHOUSE,	J. R. WILCOX,
JAMES DRURY,	GEO. H. HOPPS,
A. R. WELLS,	EDWIN FRETWELL,
JAMES SPIERS,	GEO. SPAULDING,
J. H. CULVER, Sec'y,	J. H. GILMORE, Sup't.

Committees.

AUDITING.—Waterhouse, Kerr, Gray.
BUILDING.—Drury, Wells, Wilcox.
CIRCULARS AND CLASSIFICATION.—Fretwell, Hopps, Spiers.
PRINTING AND ADVERTISING.—Spaulding, Fretwell, Gray.
POWER AND MACHINERY.—Spiers, Dinsmore, Wilcox.
RULES, REGULATIONS AND AWARDS.—Dinsmore, Spiers, Bauer.
TICKETS AND ADMISSIONS.—Wells, Kerr, Fretwell.
MUSIC AND DECORATIONS.—Bauer, Starbird, Hopps.
PRIVILEGES.—Kerr, Starbird, Waterhouse.
LOCATION.—Starbird, Spaulding, Drury.
POLICE.—Gray, Drury, Spaulding.
HORTICULTURE.—Hopps, Waterhouse, Bauer.
GAS AND WATER.—Wilcox, Wells, Dinsmore.
ART.—Hopps, Bauer, Gray.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

THE State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

Metals.

Mining and Other Companies.

Pereone intereeted in incorporated ehares will do well to recommend the publication of the official noticee of their companies in thie paper, as the cheapeet appropriate medium for the eame.

DIVIDEND NOTICE.

OFFICE OF THE

Silver King Mining Company,

SAN FRANCISCO, JULY 8, 1881.

At a meeting of the Board of Directors of the abovenamed Company, held this day, a Dividend (No. 10), of Twenty-five (25c) Cents per share was declared, payable on FRIDAY, July 15, 1881, at the office of the Company, Room 10, No. 328 Montgomery street, San Francisco, California. Transfer books will be closed on July 11, 1881.

JOSEPH NASH, Secrstary.

EXTRA DIVIDEND NOTICE.

OFFICE OF THE

And in accordance with law, and an order of the Board of Directors, made on the 31st day of May, 1881, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, 325 Front St., San Francisco, Cal., on Monday, the First day of August, 1881, at the hour of Two o'clock, P. M., of said day, to pay Delinquent Assessments thereon, together with costs of advertising and expenses of the sale.

E. J. BLANDING, Secretary.

Office—325 Front St., San Francisco, Cal.

Steep Hollow Gold Mining Company.—

Location of principal place of business, San Francisco, California. Location of works, Liberty Hill Mining District, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of June, 1881, an assessment (No. 6), of $1.50 per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of July, 1881, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the 18th day of August, 1881, to pay the delinquent assessment together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. PEW, Secretary.

Office—310 Pine St., Rooms 15 and 17, San Francisco, Cal

BUY LAND

Where yon can get a crop every year; where yon will make something every season; where you are sure of having a crop when prices are high; where yon have a healthy place to live; where you can raise semi-tropical as well as other fruits; where yon can raise a diversity of grain and vegetables and get a good price for them. Go and see the old Reading Grant (in the upper Sacramento Valley), and you will find such land for sale in sub-divisions to suit purchasers—at reasonable ratos and on easy erms. Send stamp for map and circular to EDWARD FRISBIE, proprietor, (on the Grant), Anderson, Shasta Co., Cal.

DEWEY & CO.'S
Scientific Press Patent Agency.
[ESTABLISHED 1860.]
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

WIND MILL. One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

THE O'HARRA
CHLORIDIZING FURNACE.
Patented in 1878.

SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

—o—

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1.10 per ton to work 40 tons in 24 hours.

At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61½.

Lewis Chalmers, of the Isabella G. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenial sulphurate of silver up to from 84% to 95% of the assay.

SAN FRANCISCO, SATURDAY, JULY 30, 1881.

VOLUME XLIII Number 5.

Safety Attachment for Mine Cages.

C. Douglas Brown, of Prescott, Arizona, has just patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an improvement in attachments for mining and other elevator cages, by which such cages are prevented from falling if the rope or anything else breaks. One of these attachments is now being made by Reynolds & Rix, 49 Fremont St., general agents for the Pacific coast, which will be placed on exhibition in working order at the Mechanics' fair.

Mr. Brown's device consists in the employment of inclined arms having their outer ends formed to engage and hold in the guide timbers between which the cage moves, while their inner ends are connected with a ring secured to a vertically sliding spindle or king-bolt having elliptic, spiral, or other springs to draw it down forcibly if the rope breaks, and thus cause the ends of the inclined arms to engage the guide timbers. As soon as these arms become engaged and fixed in the guides, the whole weight of the cage is transferred to the king-bolt, by which it is suspended, and through it a direct power is exerted to fix the arms in the guides independent of the spring. A sliding ring or sleeve upon the king-bolt below the attachment of the inclined arm is connected with them by stays or bracing arms, which cause both of the arms to be thrown out simultaneously, and equally prevents them from being thrown out too far by the shock, and assist in strengthening and bracing them.

The frame of the cage has clips which extend upon each side of the guide-timbers, where the safety-arms will engage them and thus prevent the timbers from being split by the arms when they are forced into the timbers. Rubber buffers or springs below the nut at the top of the king-bolt relieve the jar when it brings up on the catches, and the platform or floor may also be supported upon springs to relieve the force of the blow.

The engraving shows the timbers of the guide-frame of a cage-well such as is employed for hoisting purposes in mining shafts.

From these upper cross-timbers an angular frame extends upward, being bolted or otherwise fixed to the cage frame, and it serves to support a protecting roof, which protects the occupants of a cage from falling rubbish or a broken cable.

Through or between the cross-timbers, and through the roof of the cage, a king-bolt or spindle passes, having a vertical or end play, and being prevented from turning around by feathers fixed to it and moving in suitable slots or guides. To this king-bolt or spindle is fixed a sleeve, having projections at its opposite sides, to which the inner ends of the two safety arms or dogs are pinned. These two arms extend at an incline downward and outward through slots in the frame, so that their outer ends stand in line with the inner faces of the guide timbers (not shown), between which the cage moves. The ends of these arms are so formed that they will readily engage with or penetrate the guides when forced outward, and they will thus hold the cage supported from its spindle.

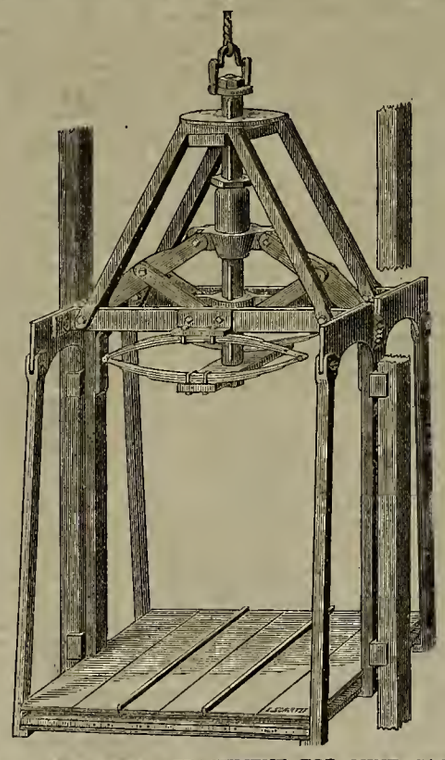
Below the timbers of the cage are secured springs, any kind. The spindle passes through or between the springs, and a strong plate with adjusting and holding nuts at the bottom retains it in place, and also enables the inventor to regulate the tension of the springs. A plate or head at the top of the spindle will serve as a stop when the spindle is drawn down by the spring, and an elastic buffer on the spindle relieves the jar when the cage is suddenly stopped.

A loose or sliding sleeve is fitted to slide upon a feather on the spindle below the fixed sleeve, and two arms extend from lugs on this sleeve to a point about midway in the length of the arms. These short arms, with their sliding sleeve, act together to hold the other arms, so that they will be thrown outward simultaneously, and will each engage its guide equally with the other, thus preventing any side strain.

Upon the sides of the cage, at top and bottom, are secured clips, which extend outward upon each side of the guide timbers, and thus insure the central position of the cage in the shaft. The upper clips are placed upon each side of the slots in the cage frame, through which the arms are projected into the guides, and as they project on each side of the guides, they will prevent the latter from being split and spread apart by the action of the dogs.

The floor of the cage has rails, upon which cars may be run to be elevated in the usual manner. The spaces at each side of and between the rails may be fitted with a false bottom, which rests upon springs, so that the shock of sudden stoppages of the cage will not be communicated so severely to the occupants of the cage.

THE YUBA DAM.—State Engineer Hall, who has just been on a visit to the Yuba debris dam, announces that he is satisfied that the dam will accomplish the purpose for which it was built. He states that only about 200 ft. of the 10,000



BROWN'S SAFETY ATTACHMENT FOR MINE CAGES.

ft. of the dam constructed in accordance with the original plan, were washed out last winter. The part which gave way most was earth work, hurriedly put in at the close of the season to complete the work. He says that he will make a report to the Governor, and that the report will probably be published in the course of a week. Col. Mendell will report to the War Department at Washington the result of the observations made under his direction.—*Nevada Transcript.*

IN speaking of the mines of San Diego county, a correspondent writes: "The mountain region between here and the desert is alive once more with miners. Work has been resumed on some of the Julian claims. The Washington, Rough-and-Ready, the Garden and the Hubbard are all showing well."

THE Howell furnace at Montezuma, under the management of Chief Smelter Thomas, formerly of Cerro Gordo, says the Inyo *Independent* of July 23d, completed its first run of 1,000 bars, and then went right on. It is a lively camp, working about 60 men. The only drawback is a scarcity of water, of a very bad quality at that.

The Richmond-Albion Decision.

An associated dispatch from Eureka says Judge Rives this morning rendered his decision in the case of Richmond versus the Albion, the result being an unequivocal victory for the Richmond company. The Judge holds the St. George patent to be absolutely void, the Uncle Sam claim is a good and valid location, and in fact every point contended for by the Albion as between the St. George patent and Uncle Sam location is found strictly and unequivocally in favor of the Albion. But the close of the decision is the surprising part. Among other paper titles put in by the Richmond was a patent called the Victoria. This patent was procured by the Richmond pending the protest suit between the St. George and Uncle Sam. It is a younger claim and a younger application for a patent than either the St. George or Uncle Sam. The Judge holds that it is a better title than that conferred by the prior application for the St. George ground. The Victoria patent was scarcely alluded to in the late trial. The Richmond made its big fight on the validity of the St. George patent, which has been thrown out as utterly worthless and void. The finding in favor of the Victoria will be a surprise to everybody, as it cut but an unimportant figure in the case during the trial. A stay of all proceedings will be granted for 30 or 60 days to allow the case to be taken up, and to prevent the destruction of the estate by either party. The decision occupies 30 pages of legal cap.

At the conclusion of the reading of the decision the Albion asked for an injunction covering the disputed premises in the other two cases pending between the same parties. The injunction was granted for the whole ground until the hearing of these cases. The Albion was required to file a bond in the sum of $10,000, which was immediately given.

IT is stated the Wood River Gold and Silver Mining Co. has leased the Morgan & White smelter, in Salt Lake City, to reduce the ores of the company's mines on Wood River.

Pillow Blocks for Mining Machinery Shafts.

In the class of bearings that are employed for heavy shafts, more particularly for mining machinery, it is customary to form vertical inclines upon the backs of the brasses, and wedges are fitted to move vertically up and down in a space behind the brasses to adjust them to or from the shaft as may be required. The objection to this method is that the wedges must necessarily be short (being limited by the depth of the side brasses), and their bearings are so small that the brasses are liable to twist on this account. They can also have but a short space for adjustment; and, lastly, as they must be adjusted by screws, which pass through a cap, these must be removed before the cap can be taken off, thus leaving the brasses unsupported, and the set of the shaft may thus be disturbed by the removal of its side supports.

To remedy these defects, Mr. Irving M. Scott, Superintendent of the Union Iron Works, has recently invented and patented through the MINING AND SCIENTIFIC PRESS Patent agency, a novel method of adjusting and regulating the set of bearing-brasses by the use of horizontally inclined wedges and faces with suitable actuating screws, all operating independently of the cap, which may thus be removed without disturbing the brasses or the set of the shaft.

In Mr. Scott's device the side brasses have flanges projecting at right angles from the ends, so as to fit the sides of the pillow-block, and thus hold the brasses in place. The backs of the brasses are formed in with an incline face, extending from end to end of the brass between the flanges.

Wedges are fitted into the space behind the brasses, lying horizontally and having holes formed in their ends with screw-threads to receive the horizontal screws, which, when turned, will cause the wedges to advance or recede. The shanks of the screws have collars which fit in spaces between the flanges of the brasses and a projection so that when turned the screw will not advance or recede, but will move the wedge. Instead of forming screw-threads in the ends of the wedges, as above described, recesses may be made to receive nuts, which will operate in the same manner. These wedges may be made of considerable length, on account of the width of the box, and they will thus support the brass for so great a distance that it will be very rigid and will not twist or get out of place. The space for adjustment is much longer, and, finally, as the adjusting screws pass in through the sides and are independent of the cap, the latter may be removed for inspection or other purposes without touching these screws or in any way disturbing the position of the brasses or the set of the shaft, which might otherwise get out of place.

REDUCTION WORKS IN NEW MEXICO.—The Albuquerque (N. M.) *Journal* says: It will be but a short time now before quite a number of smelters, stamp-mills and reduction works are in full operation in New Mexico. Cerrillos station has a smelter complete, except the roaster which is nearly ready. Ortiz station, near by, will have one running soon. At Bonanza City, the Duryee furnace and Gonzales Reduction Works are nearly ready to start. The Canyon del Agua Co. have a smelter nearly ready, and their extensive hydraulic system for placer washing will soon be in operation. At Socorro, several smelters and stamp-mills have been arranged for, and two or three are in course of construction. Another one is to be erected at Allamille, 12 miles north of Socorro. One is likely to be erected in the Oscuras, another near Las Cruces to work the ore from Oregon mountain. White Oaks has a smelter and concentrating works in immediate prospect. Silver City will have nearly 100 stamps in operation within the next four weeks.

PARTIES have located an iron mine on the mountain east of Rutherford, about a mile from the Whitton quicksilver mine. The locations, four in number, are each 60x1,500 ft., equal altogether to an area of 80 acres.

Mining Company Reports.

Savage Mine.

The annual meeting of the Savage Mining Co., held at the office of the company on the 21st, was a lively contest for the control of the mine. The cramped quarters in Nevada Block occupied by the company's office were crowded to discomfort with mining secretaries, brokers, stock operators, reporters, and others. The contest was between the factions known as the Hosflich, on the one side, and the Williams, on the other, the first being the inside and the latter the outside. Each side had its adherents present in full force.

Thomas H. Williams, President of the company, said that he had no written report to make, as all that it was necessary for the stockholder to know was contained in the reports of the secretary and superintendent, which would be presented to the meeting. The present management of the mine had endeavored to conduct its affairs honestly and economically. Some complaint had been made that operations had not been so conducted as to make the stock lively in the market. It was not his habit to make things lively without something to do it on, and that something had not been found in the Savage. Complaint had also been made at Virginia that the mine was not worked so as to give employment to a large number of miners. He was glad that one of the principal charges against his management was that it had not been extravagant. They had been waiting for several months for the result of the hydraulic pump experiment, and it afforded him pleasure to read a dispatch from Superintendent Regna. This dispatch stated that the pumps were running satisfactorily and that no machinery could run more smoothly.

The roll-call occupied about four hours, and there was considerable animated discussion at various stages of the call over rulings by the President.

At the election, the following Trustees were elected: Maurice Hoeflich, H. M. Levy, L. T. Lazure, J. B. Russel and Geo. I. Ives.

The new Board met and organized by electing the following officers: President, H. M. Levy; Secretary, Edward B. Holmes; Superintendent, R. P. Keating.

Following is an abstract of the report of the Superintendent, R. W. Chase: There has been nothing done during the past year toward freeing the mine from the water. The drift from the C. N. S. shaft to connect with our incline at 2400 level enconntered so strong a flow that it was considered unsafe to advance farther until the shaft company had better facilities for handling it. It was therefore decided to bulkhead the water and await the completion of the new hydraulic pumps. Following is a brief resume of work done in the mine: The lateral drift, 2400 level, from C. N. S. shaft, to intersect Savage incline, is in a total distance of 720 ft. One bulkhead was constructed 70 ft. from the face and one 36 ft. from the junction. There has also been one put in on the 2200 level to stop the flow of water into our incline, making three in all. These are of the strongest kind, being built of stone laid in cement. The general repairs to the mine have been of an extensive character. Owing to the heavy pressure of the ground, the shaft has heretofore required constant repairing. I have retimbered 500 ft. of it. The stations had been standing so long that the timbers were decayed and crushed in such a manner as to require them to be newly timbered. The incline for a distance of 1,200 ft. has been eased and a considerable portion of it retimbered. All necessary work has been done on the pumpbobs, pits, tanks, etc., as far down as the water would permit to put them in good condition for running. The prospecting has necessarily been somewhat limited, being confined to levels above the submerged portions of the mine, principally the 1300, 2000 and 2100. After completing all necessary repairs in the mine it was shut down until such time as the bulkheads could be opened, which will depend upon the working of the new hydraulic pumps. The surface machinery has been thoroughly overhauled and put in good condition. The shaft since shutting down the mine seems to stand exceedingly well.

Following is the report of the secretary, which was read at the meeting:

RECEIPTS.

Balance Supt's account, July 1, 1880	$59.60
Virginia & Truckee R. R. Co	4,752.87
Sutro Tunnel Co	227.00

Cash balance, July 18, 1881	9,166.36
	$366,953.14

The Yellow Jacket.

The annual report of Supt. Taylor, of the Yellow Jacket, is in brief as follows:

Owing to the accident to the pumping machinery, which occurred November 11th, but little work was done on the lower levels during the fiscal year ending June 30th. For nearly seven months the mine was flooded, the water rising as high as the 2250 level. While employed making the repairs to pump engine we opened a station at the Sutro tunnel level (1,513 ft. below the top of the shaft), and ran a drift northeast from the same 70 ft. to the proposed line of the Sutro tunnel, at which point we placed a switch and drifted north from the same 668 ft. to a connection with the south header of the Sutro tunnel. This drift was uniform in grade, size and construction, as per contract with the Sutro Tunnel Co. We also drifted south 75 ft. from this switch, making 743 ft. of the Sutro tunnel run by this company. A portion of this work was done in the ground of the Challenge Con. and Confidence mining companies. At the same time we placed a second line of 14-inch pumps from the 2828 level tank station to the Sutro tunnel level, thereby doubling our pumping capacity; also double strapped the upper portion of the pump-rod at all the joints. On the 16th of April, the Sutro Tunnel Co. having completed the drain boxes, we started the pumps and tanks to drain the mine. On account of the several connecting levels, we at the same time drained all the mines between the Bullion on the north and the Segregated Belcher on the south.

We were somewhat delayed in this work, caused by the slipping of the pole brackets of the 2800 and 3000 level pumps, which obliged us to get two 14-inch lift pumps and two steam pumps, with which we lowered the water and secured the poles. We pumped and hoisted 86,000,000 gallons, or 360,000 tons of water, before reaching the 3000 level on the 20th of June.

We have had since that time a steady flow of 60 miner's inches or 720 gallons per minute. About 20 inches of this quantity comes from the Crown Point and Belcher mines, and 33 inches from the Imperial group of mines; the balance or about 7 inches being the quantity of water our mine makes.

Work has been resumed on the lower levels. During the year 1,055 ft. of drifts were run, 743 ft. of the Sutro tunnel made and 980 ft. of prospect holes (on the 2700 level) bored with the diamond drill. Balance-hoh stations were excavated at the 1200 and 2150 levels, and bohs erected in the same.

The Overman.

At the annual meeting of the Overman last week the following directors were chosen for the ensuing year, all being re-elected: S. Heydenfeldt, Sr., R. F. Morrow, Joseph Clark, G. W. Beaver and R. Wegener.

At a subsequent meeting of the directors the following officers were re-elected: President, G. W. Beaver,; Vice-President, R. Wegener; Secretary, George D. Edwards, and Charles Forman Superintendent.

The president stated that no report had been submitted by the superintendent, but the secretary's report of the financial condition of the property was as follows:

DISBURSEMENTS.

Cash overdraft, July 1, 1880	$ 16,159.37
Advertising	693.00

The Utah Mine.

At the annual meeting of the Utah mine the following directors were elected: R. H. Follis, John Skae, Geo. Wallace.

At a meeting of the newly-elected Board of Directors the following officers were elected: President, R. H. Follis; Vice-President, John Skas; Secretary, G. C. Pratt; Treasurer, Nevada bank; Superintendent, A. G. McKenzie.

Trial Balance.

Following is the trial balance for the year ending July 12, 1881:

Advertising	$ 550.00
Assaying	116.00
Books and stationery	97.85
General expense	1,763.10
Hauling	671.00
Transportation and hauling	1,412.86
Interest	1,064.05
Legal expenses	1,045.00
Virginia office expenses	723.34
Supplies	24,858.05

" " 33	40,000.00
Nevada Bank	14,388.32
Loss and Gain	23,717.61
Total	$160,104.33

The report of Alex. G. McKenzie, Supt., is in brief as follows: The main incline has been sunk and timbered 530 ft., passing through a favorable foot-wall formation; alternating in its character and at times very hard. The bottom of the incline has now reached a point 25 ft. below the 2350 level. Sinking will be continued and pushed as rapidly as possible until the 2500 level is reached, when a drift will be started east to a connection with the north drift now being run from the Union Con. and Sierra Nevada mines. This work, when completed, will secure excellent ventilation and make development work possible in a large space of undeveloped country. There has been 1790 ft. of drift run in the mine during the past year showing nothing more valuable than a well defined vein formation which shows a very decided improvement in character as depth is acquired.

We are now engaged in repairing and cleaning out the old drifts on the 400 level, with a view to the further development of the mine at this point. Work on this level was necessarily abandoned some years ago, caused by the finding of heavy flows of water. This difficulty is now overcome through the benefit of the line of pipes laid from the mine to the Sutro tunnel.

All the machinery and everything appertaining to the mine is in first-class condition.

Advertisements and Adverse Claimants.

A Montana case, just decided in the General Land Office, presents some peculiar as well as interesting features. An application for patent was filed by the locator, and due notice of the same was given in the usual way, by publication, etc. It so happened that the printer, for his own convenience, attached to the advertisement, a notice that the advertisement expired on a certain day, which was several days after the legal limit in which adverse claimants could file their protests. An adverse claimant alleged that the note of the printer misled him, and that when he offered his papers at the local office, they could not be received because the time for filing an adverse claim had expired. Under these circumstances he appealed to the Commissioner, who sustained the decision of the local office, and says "that it is not the province of a published notice to inform adverse claimants at what period the time within which an adverse claim may be filed expires; but its office is to inform all interested, that an application for certain mineral land has been filed at a date named, and adverse claimants are therefore put upon inquiry." In other words, it is presumed that every claimant knows the law and must judge for himself when the time for filing expires, and must not be led astray by false lights, and therefore must suffer the consequences of his own negligence or ignorance, and the department can afford no remedy.

SHOT WITH A PIECE OF QUARTZ.—A singular accident occurred above Cherokee, on Thursday morning last, to a miner named Samuel Smith, who was working in the "Old Duffield claim," with Mr. F. B. Fowles. These men were developing the mine, Mr. Fowles working during the day, and Mr. Smith at night. About five o'clock, on Thursday morning, Mr. Fowles heard a blast in the direction of the mine, and at seven o'clock went to the mouth of the tunnel to resume his shift, and seeing no light, or hearing no noise thereabout, he hallooed the man's name in the tunnel several times. Getting no response he started to find out the cause, and after going some distance he stumbled upon the lifeless body of poor Smith. Fowles had him conveyed to a cabin near his residence, and sent for Coroner Van Harlingen. On examination there was found to be but one wound. A piece of quartz about one-half an inch one way, and one-fourth of an inch another, had broken through the center of his breast bone and imbedded itself in his heart, making a hole as if shot by a musket ball. From appearances of blood stains, he had walked about 15 ft. after being struck. The accident is accounted for in the supposition that the blast did not go off as soon as he expected, and went back to examine the cause, and when about 15 or 20 ft. from the place an explosion occurred and he was killed by the flying fragment. Mr. Smith was a native of Sweden, aged 59 years, and was highly respected by his brother miners and all who knew him.—*Tuolumne Independent.*

INTEREST in the mines along the Colorado river has been revived by the recent railroad surveys. Claims have been located at Cottonwood island, Hardyville, Mohavs, the Needles, Ehrenberg, the Colony and Castle Domes.

THE payment by the Ontario, of Utah, of its 69th dividend of $75,000 on the 15th inst., made a total of $3,575,000 thus far paid to its stockholders.

California.

California is a peculiar land in a peculiar clime. California is a problem yet unsolved. Some of the factors seem to be discerned; others are still out of sight. Intellectually eccentric, socially unripe, morally undefined, our future, as a people, is a puzzle to philosophers. Our plant life is a treasure-house of novelties to the botanist; our zoology from the fish in the wave, the mollusk on the shore, the insects that devastate orchard and field, defoliate the foot-hill oaks or hore the Sierra pine, is *terra incognita* to the naturalist. Our meteorology defies the prophet at whose call fifty millions Americans beyond the mountains, fly the coming storms. Our industry is a youth whose present growth foreshadows an Hercules in strength; a Proteus in range of accomplishment. With her sky unknown, her soil almost untried, her manufactures just born and her people determined and yet bewildered by the novelty of the conditions and materials which surround them, California is indeed a mystery to herself and to the world at large.

Such being, in very outline, our place among the things which are, it is little wonder that California is often misunderstood and sometimes misrepresented. Even those who know California best know her but in part; no single man knows California wholly, even in her present state. Passing the California chapters in the sciences which have hardly their introductory paragraphs written, there is no one who knows wholly the single branch of our industry known as California agriculture—a branch with a thousand twigs and unnumbered leaves. This fact should be borne in mind by the thousands abroad who are prone to judge of California by the reports of individual successes or failures which come to their eyes or ears. In believing either the good or evil things which are said of our State, it should be understood that good might be evil and evil good, if either were moved up or down a valley, from hillside to plain or from coast to mountain.

Occasionally there is a man with keen observation and wide grasp of deduction who, even during a short acquaintance with our State, appreciates our conditions and sets them forth in language fitting their character. Such a one is Bishop E. O. Haven, who, writing to an Eastern journal (the *Christian Advocate*), thus freely chats of California:

> California is the most mysterious of all the States I have yet seen; and I have traveled, more or less, in all but three. No brief description can give any adequate view of it. The encyclopedia pictures are, as usual, monotonous and cadaverous, while the sketches by travelers often fall into the error of representing the whole as like some little spot that happened for a time to fill this eye. California is full of contradictions. To those who wish to study it before seeing it we would recommend two precepts, namely: 1. Believe all that you read and hear about it. 2. Believe nothing that you read and hear about it; for all is probably true of some place, and nothing is true of a majority of the places. It is 700 miles long, north and south, and nearly 200 east and west—an immense nation of itself. It is a land of mountains, some perpetually snow-clad, and of valleys and plains, in most of which snow is never seen—except at a distance—a land, some of which is as barren as Sahara, and which yet could furnish several Egypts fully as fertile as the original valley of the Nile; a land of corn and honey and wine; of oranges, lemons, plums, apricots, peaches, almonds, and English walnuts and apples; of potatoes and beets, and squashes and melons; of treeless and grassless prairies and dense jungles, and shrubs and trees that began to grow before the times of Noah, and seem never to have found a stopping-place; a land of coal and silver and gold; of grizzly bears, coyotes and gophers, and of men and women from all parts of America and Europe, and not a small sprinkling from Asia. Take it for all in all, it seems about impossible to write what is not true about it. Still we will not try, but, as usual, endeavor to keep within the limits of fact.
>
> One can see at a glance that California has mountain ranges extending crookedly north and south, with valleys and plains of various width between them. These are crossed by numerous passes and river courses east and west. Over all blow the west winds from the ocean, dropping their showers on the valleys and plains, and their snows on the mountains in the winter, and their water on the mountains in the summer.
>
> Sometimes in your travels you will find yourselves sweeping over immense plains like those of Illinois and Texas, only not like the former in being actually boundless to view, nor like the latter in the border of forest trees, but terminating in mountains on one side clad in snow. These plains sometimes will be covered with fenceless wheatfields, the most prolific anywhere to be seen; in others, rimmed over by cattle; in others, arid and useless; in others, broken into numberless orchards of every kind, and small farms; in others, covered with patches of forest; in others, narrowed down into valleys; in others, broken into hills and vales. The kind of agriculture suited to one place would be utterly useless in another.
>
> Thus, California, with its usual variety of soil, becomes just about the most mixed up and infinitely various country of its size probably anywhere on the round earth. It is most of all like ancient Palestine, the Holy Land, only it is more than 50 times as large! Think of that—material enough to make 50 Palestines, and yet the one Palestine is giving character to the world! California ought to be able by and by to govern at least 50 continents.

We have indulged in a long quotation. We could not make it less, nor would we either, for these are facts which should be prominently set before the world. And if it be added that what Bishop Haven has written with chief reference to our agricultural conditions could be as well said, though in different words, of the varied character and development of all our resources and all our industries, the one who seeks to know California from a perusal of recorded facts or from a flying visit, may appreciate the problem which he attacks. California is great and is destined to be greater far. The tendencies now exerting their full force upon our people are of a most salutary kind. There has been a wonderful sweeping away of fallacies during the last few months and years. The real is putting to flight the unreal at every point. The shoutings of the demagogues have sunk to hoarse whispers and a hush people no longer listen. The fever for speculation has run its course, and the large on paper has been broken up into a thousand bttles.

Mechanical Progress.

Buying Second-hand Machinery.

Persons buying second-baad machinery either to sell again or for their nwn nse bavo need to ook carefully to all parts, so as to hs sure that they ars getting what they bargain for. It often occurs tbat good tools can be obtaiaed at a reduction from first cost; it also often bappens that ingenious persons paint and putty up an old lathe, or planer, or a steam sngine that bas seen its best days, and is worthless for anytbing else but to sell.

In buying a second-hand steam engins the cylinder and steam-cbest covers should be taken off aad ths parts examined to see if they are in proper coaditioa. Ths cylinder may requiro rehoring to make it true and smootb, and tbe expense of this job should he taken into accounr in estimating the valne. The valve-face may require refitting and the valvs also, and tbis must be taken into account. The bearings must he examined to sse if the brasses are not entirely worn out, and backed up with "sbims" so as to make them answer the purpose. The bed-plats must bs looksd at to scs if it is not crackod in an important part, and the bolts and nuts under constant use to sso if tbsir throads are not stripped or worn out. Whatever heater is used on tho engins it mnst bs thoroughly overhanlod to ascertain tbs condition of its tubes. In many cases tbsy are nearly rusted out, particularly if tbe enginc has been standing some tims without nss. Ths fesd-pnmp will also bear iaspection as to its valves and the condition of them.

All the valves will need examination for tbs condition of their seats.

In buying lathes ths cone-pulley bearing on the spiadle should be examined, also ths lead-scrsw near tbe head stock, the shsars, and tbe slide-rest. All the refitting required on these parts sbould bs estimatsd in purchasing a machias. Wherever thers ars trains or gears with latbes tbe sams sbould he exsminsd to see if tbey aro not broken as to their teeth.

Screw-cuttiag machines should be looked at as regards the dies; if ths latter are worn ont ons of ths most expensive details of that class of machines is destroyed. Planing machiaes sbonld ho examined in the gearing and in the slides, botb on the bed and tahlo, and cross-bsad. Some planers tbat bave boen nsed on spscial work are fit for no other until overhauled, for tbe reason that tbey are worn tbe most in particular places.

Cracks in frames are easily detscted by sounding with a hammer. If tbe casting is sound it will riag, but if cracked it is not sonorons.—*The Mechanical Engineer.*

The Proper Use of Iron in Building.—In a paper recently read on "Ths Proper Uss of Iron for Building Purposss," by Mr. E. T. Bsllhouse, of Manchester, the author remarked: One clsss of error occasionally committed by designers not tboroughly versed in iron construction shonld he specially avoided. I bave seen a rigid cast iron beam, in one pieca, resting at each snd upon tbe main walls of tbe building, supported in the center by a column. If tbsre should bs any sattlement or sinkiag in the foundation of walls, or of one of them, and the pillar stone sbould remain firm, ths beam would have its back broken over tbe column. If, on the other hand, tbe pillar foundation gave way, and ths walls remained firm, the superincombent weight would, in all probability, bs too much for tho beam to bsar. In such a cass tbere should bave heen two castings, witb such a joint ovar tbe column as to admit of a slight deviation from the horizontal liae, if any sucbs bould occur. In using wrought iron beams—as in the cass of timber—the elasticity of tha material will admit of considerable deflection without any danger, so no special provision need be made for ths contingency. We may add that ws bave seen in a very large structurs cast iron employed in tension, and wrougbt iron in compression. Needless to say, tbis was in accordance with an architect's specification.

Steel Boilers in France.—If we may judge from a recent discussion at a meeting of the *Societe des Ingenieurs Civils*, steel appears to he making slow progress in France as a material for stationary boilers. On the 20th ultimo an interesting paper was read before the above-named society, hy M. Jourdian, on boiler inspection associations; and, in the course of the discussion which followed, the author was asked hy the president as to the extent to which steel appeared to bave a tendency to replace iron as a material for boilers. In reply to this inquiry M. Jourdain statod that a certain number of makers were employing steel plates for parts directly exposed to the fire, but that *he did not know of any stationary boiler constructed entirely of steel.* As M. Jourdian is in a position to he well acquainted with French practice, we can only conclude that our neighbors across the channel are greatly behind us as far as the general use of steel is concerned. This is the more to he wondered at, as the steel plates turned out at Creusot, and at some other French works, are of an admirable quality. In tbis country stationary boilers of steel are now to he counted hy hundreds, and we have little doubt that before many years are over, the same will he the case in France.—*London Engineering, June 10th.*

The Strength of Small Spruce Beams.

Mr. F. E. Kidder bas recently performed a ssries of experiments at the Massachussetts Institute of Tecbnology, having for their object tho detormination of the moduli of elasticity and of ruptnre in small bsams of whits spruce (*Abiealba*), aud such other information as might hs derived from the data obtained. The results of tbese researches are embodied in a paper rsad beforo tbe American Academy of Arts aad Sciencss, aad printed in the current number of the *Journal of the Franklin Institute.* Tho conclusions drawn from the results of ths experiments are as follows: Tbs modulus of elasticity depeads not only upon tbs elasticity of tbe matsrial, but also upon tbo lengtb of tims tbat the losd is applied. When subjected to loads not exceediag ono-sixth of tbe breaking weight, sprnce beams do not take a permanent set; but sven under very small loads, if applied for any lengtb of time, tbers will be a temporary set. Knots and gnarls in beams loaded at the center, when not witbin one-sigbtb of the span of tho center of tho beam, do not materially affect tbo olasticity under small loads. Deflection is vary nsarly proportioaal to the load, far beyond tho customary limits of the strain, and tbe modulus is consequently very nearly constant for all moderate deflections. A high modnlus of elasticity does not always accompany bigh transverse strsagtb. In sprucs bsams tbe upper fibers begin to rupture hy compression under about four-fifths of tho hreaking weight, and ths neutral axis, at tbs time of rupture, is vary near the cantsr of the beam, as sbown hy tbe fracture. Beams which are subjected to severe strains for a loag tims, bend more before brsaking than tbose whicb sre broken in a comparatively short time. Tbe modulus of elasticity of small spruce beams, of a quality sucb as is nsed in ths hast buildings, may be taksn at from 1,600,000 to 1,700,000 lbs., and the modulus of rupture at 11,000 lbs.

The Shop Foreman.—It would ssem, at first glancs, tbat a shop foreman should bs the best general workman in tbe establishment, and this is undoubtedly desirabls if one can bs found with ths otber qualifications nscessary to a good forsman; but this is not often tbs case. Lst us see what combination of qualities tbe best general workman must possess to make bim eligible as a foreman.

Hs must be a soher man wbo makes six days a wsek. He should have tbe confidsnce of bis smployers and tbe respect of the workmen. Hs should know bow to manage as well as to command men. He must bs ahle, in the shop at least, to entirsly divest himsslf among the men of his old standard as a workman. Hs must bs strictly impartial, and have tbe tact to find out the best way to get along with tbs men he has, and not tbose he would liks to have. He must bs ahle to plan ahead, bave a good memory, a quick perception, ho a rigid disciplinarian, and possess sound judgment; and because thess qualifications are not oftan combined in tbe hest workmen, is tbe reason why such a man is not always mads forsman, and why the foreman is not always tbe best workman of the shop.—*Mechanical Engineer.*

A Plastic Metal.—In England a very ussful material bas heen brought out which, under the name of "J. Richards' Plastic Metal," is heing mads hy tbe J. Richards Plastic Metal Co., of Cbarlotte street, Birmingham. In general outward appearance it resembles some of tbe other varieties of wbite mstal so largsly usad for lining bearings, but it has a remarkably close, hard texturs and takes a good polish. Its special feature, however, is its great affinity for othar metals, this afinity enabling it to be readily "pasted on" with a plumber's soldering irou, it heing impossihle when it is thus attachsd to remove it hy abrasive force. As it fuses at about 450° F., it can bs readily meltsd in an iron ladle ovar an ordinary fira, while it is stated that it contains neither lead nor spclter, and that it is not deteriorated by re-melting. The oasa with which it can he applied renders this mstal peculiarly applicable for effecting rcpairs in the colonies, etc., whers casting fnrnaces are not available.

Temperature of Least Resistance in Steel.—It is well known that a steel tbat is very flexible when cold, breaks at tbe blue annealing temperature. It has generally hoen considered that the purer the iron is the less subject it hecomes to this defect, hut the workmen of the Ural mountains, wbo use irons of remarkable purity, have often observed the same fact. Mr. Adamson has found that the metal hecomes powdery at a temperature hetween 260° and 370° C. (500° and 698° F.), or the temperature at which willow twigs take fire. This phenomenon seems to explain a large nnmher of accideuts, as for oxample the breaking of tires under the action of breaks, and the fracture of rivcted molds and of machine arbors which become heated by friction.—*Ann. du Gen. Civ.*

Increasing Use of Steel.—Dr. Siemens claims that whenever strength and magnitude are hoth required the uso of steel is without a rival. He asserts that even for an ordinary house, steel gives more security than wood, is six to cight times as strong and costs less. He thinks that ere the lapse of many yeara steel will be introduced into huildings of all kinds, and that it will gradually supplant iron in the same way that iron already tends to take tbe place of wood.

Scientific Progress.

The Comet.

Ths comet wbose appearance has attracted so much attention during ths past fow weaks, bas also heen tbo subject of mnch scisntific study, both in this country and in Europe. Thougb loss brilliant than some wbicb have appeared to tho prssnt generation, it has novsrtheless been more intorcsting and important, in a scientific point of view, than any of its recent predecessors. In our last woek's issue, wo gavs tbe results of Prof. Davidson's examination of the stranger from his observatory in tbis city. It will probably he some tims bofore we shall get ths results of Eastern and European obssrvations in calculating tbe elements of the comet. When first obssrved, it was about 70,000,000 miles from tbe sun and receding at the rato of 1,000,000 miles a day. It was at tbe same time about 30,000,000 miles from tbe cartb. The nucleus at that tims was estimated to be about 1,200 miles in diameter, witb a tail 40,000,000 miles long. Ths semi-circular envelope or haze abont the head was cstimatcd to be about 14,000 miles across. Tha comat was photographed hy Dr. Draper, of New York, on several succeeding nights. The same gentleman has also made it a careful stndy hy msans of the spectroscons. He announces tbat tbe nucleus gave a continuous spsctrum, indicating it to bs a solid or liquid body heated to incsndescsnce. Ths snvslope about tbe bead gave a spectrum indicating the presence of carbon in a gassous form. The spectroscope appoared to indicate that tbe tail shone hy its own, and not a reflected ligbt—tbat it was mads up of great numbars of separats solid or liquid particles in a stats of incandescsnce.

On the strength of these observations, Dr. Draper sxpressss the belief tbat the nuolsus is composed of mineral snbstances, partly, perhaps, of olivine, wbich is an ingredisnt of meteorites, aad of some volatile olement which yields to tbe influence of heat. As tbe comet approaches the sun, the volatile part is turned into gas by ths beat, and flames out to form the coma. Tbe fact that the coma is always on the sunward sids of tbs nuclsus strengthens this supposition. But aftsr bursting fortb on ths side toward the sun, tbe vapor seems to hs repelled, and, losing its gaseous form, to strsam away from tbe sun as a solid or liquid, thus forming the tail. Tbe canse of this repulsion cannot be absolutely asserted; hut in all probability electricity bas something to do witb it.

New Theory of the Production of Steel from Wrought Iron.

Tbs formation of steel from wrought iron by the so-called cementation process has attracted much attention from cbemists in regard to tbe mstbod of action involved. In tbis process tbe bars of wrought iron are beated in contact with powdered charcoal to a high tampsraturs, and although neither iron nor charcoal approaches fusion, yst gradually a oombination of the iron with tbe cbarcoal takes plaos, resulting in tbe production of the stesl. The qnsstion as to how the action takes place bas hean answered by ths usually acceptod tbeory, tbat in this case a small amount of air is always present, and its oxygen unites witb tbe obarcoal, forming a gassous oxide of carbon, which then permeates ths heated iron, and is then decomposed, giving up its carbon to tbe iron, and sstting free ths oxygen, wbich again in time unites witb more carhon, and the process is repeatsd. On ths basis of certain expariments, an Englisb chemist has advanced a new thenry of tbe chsmical process involved, namely, that the beated iron becomes permsable to an impalpable charcoal dust, and that the union hetwesn iron an cbarcoal is hencs direct. He finds by experimsnt tbat wben charcoal, in the form of a powder, is heated in porcelain crucibles at a high tamperature, hut helow the melting temperaturs of porcelain, ths coal penetrates ths porcelain, and can hs detactad with tho microscope. He thinks that ths sams takes plaos with the hsated iron, and that this is sufficient to explain the procoss, without the assumption of the chemical reactions necessary to the first-mentioned and older theory.—*Californian.*

An Interesting Property of Gutta Percha. Prof. Frederick Kick, of Prague, calls attention to an iuteresting, hut little known property of gutta percha. It is well known tbat it hecomes plastic in water of 60° to 70° C., and can then he usod for making the finest imprints. It is less generally known, however, that soft gutta percha is elastic when exposed to shocks, and is capable of hearing, without alteration of form, hlows of a hammer or heing thrown against a wall. This peculiar property, which other plastic bodies, too, appear to possess in a dogree, is due to air inclosed in them, which Prof. Kick has provcd hy direct experiment.

Coating Copper with Iron.—The *Maschinen-Constructeur* says that Prof. Boettger recommends the following solution for coatiug copper plates with iron. Ten parts of ferrn-cyanide of potassium and 20 parts of tartrate of soda dissolved in 220 parts of distilled water, adding a solution of 3 parts of sulphate of iron in 50 parts of water. Caustic soda solution is then poured into the mixture until the Prussian hlue formed is re-dissolved.

Heating Effects Due to Compression.

On two former occasions we have taken notice, says London *Engineering*, of the rssults of certain invsstigations instituted hy Prof. P. G. Tait, of the University of Edinburg, in rogard to tbe thermometers used in tbo Challsngsr expedition, and the allsged effects of compression upon tbem when immersed to great daptbs in tbo sea. Still pursuing tbe line of inquiry sug-gested by tbs sxpsriments made with tbese thermometers, ths learned professor bas since made a further series of experiments on tbe heating effects of compression of a number of liquids and semi-solid liquids, tbe rssults of wbicb be laid before tbe Royal Society of Edinburg on tbe evening of Monday, tho 16th ult. He mentioned tbat hs had employed a ton pressure upon each of a numbsr of differsnt substanoes, and had noticed in eaoh case tbe rise of temperature due to tbe compression exerted.

Marine glue gave a riso of temperature to tho extsnt of 0.9° Fabr.; raw potato, 0.7°; pith, 0.37°; cork, 1.3°; a pisce of bar soap, about 1.20°; a piece of licorice and a piecs of cbeese, about $\frac{3}{4}$°; a pieco of raw flesh bebaved very much liks the potato; India rubber and solid paraffino ross in tcmpsratnre about $1\frac{1}{2}$°; litbographor's ink and sboemaker's and hsswax, about 1.4°; lard, about 2°. After mantioning thess details, Prof. Tait said it was remarkable that potato and raw flesh, with so large a percentage composition of water, had a large comparativs amount of independent heat produced, wbile pith gave no parceptible difference of affect over what would bave besn produced by water alono. Cork has this peculiarity, namely, tbat wben ths pressnre was removed tbe fall of beat was only 0.9° Fabr., as against 1.3° of a rise on the application of the same amount of pressnre. That assmed to agres, he said, with what was already known of cork, namsly, that on the removal of the pressure it did not spring baok tn its origiaal form. In these rspects, India rnbbsr was opposed to cork, wbicb had tbis further peculiarity, that, on continued expsrimant, tbs amount of heat produced by tbs pressure gradnally fell till it was the same as tbe amount of cooling wbich resultsd on the relaxation nf the pressure. About sboemaker's wax there was the pocnliarity tbat it took a very long time before the hsating effect was fully produced. Its cbemical composition, also, was of conrse different from that of heeswax, which yet had precisely the same amount of heat produced. In concluding his interesting communication, Prof. Tait intimated that furtber research would bs nscessary hefore they could gat dsfinite facts showing the sxact heating effects of compression, whicb, he added, would form the subject of future communication.

The Acid of Fungi.

A great numbsr of fungi bave been found to present an acid rsaction to blue litmus papsr, and it has occurrad to Messrs. Hamlet and Plowright to ascertain wbat free acid or acid salt was so widely distributed in this family of plants. Long ago chemists have discovored tbat oxalic acid exists sithsr as oxalats of potash or oxalats of limsin many fungi and lichens, and oxalic acid has for soms time past bean looked upon hy many as a common coastituent of fungi. The authors' researches appear to confirm tbis view. In sevsral cases of common frogstools which were found to producs an acid rsaction to litmus paper, the test for oxalic acid showed its prssence in the juice of these cryptogamic plants. Tbis was more particularly noticeable in *Fistulina hepatica*, which yields 86.12% of water and contains 0.08% of oxalic acid, 0.15% of fat, 2.03% of cellulose, and 0.08% of ash. An examination of a great numbsr of species of mature fuagi helongiag to tbe genera *agaricus, boletus, peziza, polyporus, cantharellus*, etc., have lad the autbors to the conclusion tbat all maturs non-microscopic fungi contain oxalic acid, either free or combined.

We know tbat oxalate of lime has been dstected in sseral kinds of lichens, *variolaria*, etc., hut ws know also that sevsral other most interesting and important acids have besn also discovered in lichens; thersfors we regrst that ths authors ahovs named have not carried out a more extensive investigation in order to prove the existence or not of other acids than the oxalic in the great tribe of fungi. We find nothing in their paper to indicate that any snch rssearch has heen undertaken, and until such is tbe case it will he premature to attribute the acidity of fungi solely to the presence of oxalic acid.—*London Monthly Mag.*

The Possible Source of Coal Oil.—The original source and formation of coal oil is one of tho questions that has long agitated the scientific world. Among the many theories given is the following lately put forth by Prof. Mendeljeff who thinks that, on tho first formation of the earth, vast reservoirs of inorganic iron and carbon existed in the interior of the globe. These were reached hy the water condensing on the newly-formed land percolating hsneath its surface. The heat dccomposed the water into its component parts, oxygen and hydrogen, the first forming with the iron, oxide of iron, the latter with the carbon, petroleum and other hydro-carbons. If tbis theory he the correct ono, there still exists in the center of the earth reservoirs of petroleum that are to the sources as yet known as the ocean is to the spring whose waters finally find a restiug place in its bosom.

THE Esmeralda *Herald* says: There have arrived here some 1,000 tons of steel rails for the Bodie aud Mono lake railroad, and 2,000 tons more are to arrive, besides the rolling-stock and other material, which will aggregate about 5,000 tons to he shipped from this point.

By the carelessness of a Chinaman, a fire broke out in Dr. Cothran's grain fields, two and a half miles from Hollister, Thursday afternoon. Some 7,500 hags of grain were destroyed; also, 120 acres of standing grain and 75 tons of hay. The loss is estimated at $2,500.

LAST Tuesday afternoon, a 13-year-old son of Daniel Dewitt, who lives on Dry creek, seven miles from Walla Walla, W. T., was fonnd in the creek, dead, and as he was naked and subject to fits, it is supposed he went swimming aud fell in the water and drowned.

THE N. Y. Smelting and Sampling Co. are to put up smelting and sampling works at Wood River, Idaho.

The Mining Share Market.

The mining share market is heavy this week, as it has been for some time. In fact, the delay in any important development on the Comstock has discouraged very many operators entirely. The local papers there, however, keep hoping something will he fonnd. The *Enterprise* thinks that when the Union shaft main pnmps at the 2700 level are at work, and work is resumed on the main drift, something may be looked for.

It will he remembered that work was discontinued in this drift for the reason that an nnexpected change of formation occurred, which showed so much water that it was thought best to go hack and put in the pump hefore advancing farther into a region the water possihilities of which were unknown. It is not improhahle that something favorable will he fonnd when work in this drift is resumed.

As soon as the pumps are started it will be safe to push the east crosscuts on the 2500 level of the Sierra Nevada mine ont into the ore helt. At present, it wonld not he safe to rnn a crosscut into said helt. The diamond drill hole from the face of crosscut No. 3 showed so mnch water that it wae found necessary to withdraw the drill and plug np the hole. To hreak through into this belt or channel with a crosscut would donhtless canse a rush of water that would overflow the tank at the 2500 station of the Union shaft, and pouring down to the 2700 level, drive out the men now at work at that point on the pnmp. Once this pnmp is in and at work they will he ahle to handle all the water that will come. When the next start is made at the north end, matters there will he pretty closely watched hy mining men.

At the Yellow Jacket they are still drifting east. The vein mnst bs farther ont that direction than was at first enpposed, as it was thonght when the drift was first started that it wonld reach the edge of the vein in going about 70 ft. As it was not reached, the dip must he mnch less than ahove—it must he going off to the east quite flat.

Bullion Shipments.

We qnote shipments since our last, and shall he pleased to receive further reports:

Mt. Diahlo, July 19th, $7,041.75; Northern Belle, July 18th, $7,127.48; Standard Con., July 18th, $39,400.04; Syndicats, July 18th, $4,775.-88; Mt. Diahlo, July 22d, $6,576.34; Bodie Con., July 25th, $7.357; Northern Belle, July 20th, $6,016.76; Western, July 19th, $13,863.32; Head Center, July 23d, $4,003; Northern Belle, July 23d, $8,420.29; Buffalo (Rocky Bar, Idaho), July 22d, $3,600; from Silver City, Idaho, July 22d, $10,701; Stormont, July 18th, $3,383; Germania, July 18th, $3,249; Hanauer, July 18th, $3,950; Bullionville, July 18th, $2,419; Horn Silver, July 18th, $17,500; Ontario, July 18th, $14,304; Ontario, July 19th, $5,890; Christy, July 19th, $1,741; Hanauer, July 19th, $2,132; Mayflower, July 19th, $3,337; Custer, July 20th, $2,265; Ontario, July 20th, $8,115; Ontario, July 21st, $8,306; Germania, July 20th, $3,426; Stormont, July 20th, $3,004; Horn Silver, July 22d, $2,500; Custer, July 22d, $2,081; Charles Dickens (Idaho), July 22d, $3,500; Germania, July 22d, $1,744; Wood River, July 22d, $4,447; Ontario, for six months ending June 30th, $1,083,-263; Standard, for six monthe ending June 30th, $1,032,612; Horn Silver, July 23d, $10,000; Ontario, July 23d, $17,595; Germania, July 23d, $1,809; Pascoe, July 23d, $1,544; Custer, July 24th, $2,158; Northern Belle, July 25th, $6,716,-86; Standard Con., July 25th, $47,579.17.

MESSRS. GILMER & SALISBURY, the well-known mine operators, are in the city, arranging for the purchase of a quartz mill for the Geddes & Bertrand mine, near Eureka. A big ore body has recently heen strnck in the mine, and Mr. Gilmer saye he thinks it will develop into one of the principal hullion producers in eastern Nevada.

IN the shaft now snnk to a depth of 300 ft. at the Snlpher Bank qnicksilver mine, Nana connty, gas is a source of great annoyance to the workmen, nanseating them, and making necessary frequent changes on each shift of men required to perform the work.

A GOLD and silver mill is being erected at Croy's gulch, three miles from Hailoy, Idaho, for the Altnras company.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

EMPIRE.—Amador *Ledger*, July 23: Under the excellent management of the new Supt., Mr. Cliff, everything is moving along at a satisfactory rate. The mill is kept running on rock from the 1200 level, all hoisted from the south shaft. The ore is low grade, hut by putting large quantities through the mill it can he made to pay well. At present the full 80 stamps cauuot be kept going, as all the work has to he done through one shaft—hoisting rock, lowering timbers and men, etc. The north shaft is being thoroughly repaired. It is expected that a month more will see the shaft in perfect working order. As soon as the repairs are completed, a tunnel will he pushed north, at the 1200 level, to thoroughly prospect the 1,500 ft of unexplored ground in that direction. Indeed, this unexplored territory embraces more than one-half of the mine. There are hetween 170 and 180 hands on the payroll. An immense supply of wood is on hand, estimated at 1,500 cords, enough to run the works for a year.

CALAVERAS.

GLENCOE ITEMS.—Cor. Calaveras *Chronicle*, July 23: Thirty men are at work on the Valentine mill. The grading for the mill site is completed and men have gone to work in the tunnel. Carpenters are husy putting up the frame and building a dwelliug for the Supt. The Vance is running day and night. Times are prosperous; the Glencoe merchants are all doing a good business—receiving goods every few days and disposing of them rapidly. The Longly quartz mill is undergoing repairs, being put in readiness for crushing ore.

EL DORADO.

STONE DAM.—Georgetown *Gazette*, July 22: The Cal. W. & M. Co. has commenced the erection of a substantial stone dam at Loon lake. The wall is to he built entirely of granite, which is found in inexhaustible quantities, and of the best quality, right on the ground. We understand that that portion of the dam which it is intended to complete before winter is about 450 ft in length and 20 ft high at the trunk or highest point. A force of experienced quarrymon have heen engaged, a number of whom have already gone forward, remainder will follow before the end of the present week. All the tools and appliances necessary for the rapid and economical prosecution of the work, such as derricks, tackle, wire guys, car for transporting rock from the quarry to the dam, cement, supplies for the men, etc., are either on the ground or on their way there.

MARIPOSA.

THE NORTH HITE MINE.—This claim is the westerly extension of the Hito mine proper, and includes all the ground lying hetween the Hite mine and the celebrated Ferguson mine, the latter being situated on the north hank of the main Merced river, aud supposed to be the same lode which runs across the country from northwest to southeast. There can he no doubt but what this claim, vein and lode, will at no distant day be equal in importance to that of any other in the Hite's Cove section. It lies hetween two of the most celebrated and best paying mines, and possesses extraordinary advantages of timber, mill-site and water privilege equal to any in the State. Messrs. Hennessy & Morrison, having recalled their deed to the property which was held in escrow in San Francisco, uow advertise the property for sale.

HITE'S COVE.—The Hite gold quartz crushing company is surveying the country around, and contiguous to its mine, with a view to swallowing up everything of any importance to them in the near future. Reynold's cove, opposite Hite's cove, which gave signs of prominence some few years ago, is, so far as we are concerned, one of the hopeful things of the past. There are several claimants to the mill-sites and water privileges to be had in this cove.

NEVADA.

THINNING OUT.—North San Juan *Times*, July 22: Our population is being thiuned out rapidly. Nearly all the men who can got away are leaving. If the mines remain in *statu quo* for another month there won't he an unmarried man who works in the mines for a livlihood left in this section of the county.

ASSESSED VALUE.—The people of North San Juan are seriously contemplating the propriety of asking the Board of Equalization of this county for a reduction of 66⅔ on the assessed valuation of the town property. If the miners are reduced in that amount on their respective assessments, there is no reason to he given why town property should not also be reduced in a similar amount. If hydranlic mining should cease forever, the real estate in this town won't sell for 1 cent on the dollar of its assessed valuo. The houses, in the course of time, will become tenanted with owls, hawks, rats and swallows.

ANOTHER GOOD CLEAN-UP.—Grass Valley *Union*, July 23: Forty-one loads of rock from the Ford & Mullen claim cleaned up $80 to the load at Southern's mill, on Saturday, not including sulphurets. This was ordinary rock from the claim, which did not run to specimens.

PAY DAY OF THE BONANZA CLAIM.—Yesterday, at Boston ravine, was pay day of the Ford & Mullen claim, when a settlement took place hetween the owners and John Ford & Co., the lessees, from the recent clean-up of rich quartz. The company of lessees number 11 men, and they each received as compensation $18 per diem for 6 weeks' work. The 3 interests in the ownership of the claim received about $3,000 each. It was a nice "divy" all aronnd, and every one connected with the mine was well satisfied.

MARYLAND MINE.—The new shaft being sunk on the Maryland quartz mine (adjoining the Idaho on the east) has heen sunk and timbered a distance of 20 ft. It is a two-compartment shaft, 9x4½ ft. The shaft under the present contract is to he sunk to the drain tunnel level, a depth of about 320 ft. The shaft follows the dip of the vein, which is 68 degrees. The walls of the veiu have the same geological characteristics as the Idaho.

SUIT.—Nevada *Transcript*, July 23: The proprietors of the Ford, McDonald & Mullen mine have hegun suit for trespass against the Rocky Bar M. Co., claiming $40,000 damages. The two properties are adjoining. It is understood that the Rocky Bar admits having worked over the line, but denies that the ore extracted was of a rich quality. The rich ore chute in the Ford & Mullen ground is close to the houndry line hetween the claims, and that company contends that the rich ore taken out by the Rocky Bar Co. about one year ago was from their ground.

PLACER.

THE LINCOLN COAL MINES.—Placer *Herald*, July 23: As we mentioned briefly a few weeks ago, the Cook ranch, near Lincoln, embracing about 240 acres, has heen sold to John Landis, of Wheatland. On this ranch is located what is known as the Clipper coal mine. On obtaining possession Mr. Landis immediately took measures looking to the operation of the mine. He has already a steam engine in place, and is at present erecting hoisting works which it is expected to have completed sometime this coming week. A good many orders for coal have already heen received, and the prospects for an extensive husiness in the way of taking out coal are encouraging. The mine has heen closed for several years through a perplexing litigation.

PLUMAS.

GREEN MOUNTAIN.—Greenville *Bulletin*, July 20: A new hattery frame has heen put in the old mill, and both mills are now running full time on good quality of ore.

SOUTHERN EUREKA.—The mili is running steadily, and work in the tunnels is progressing. President Scott is expected from New York early in August, soon after which time it is likely that the milling facilities will he inereased by the addition of more stamps.

CHEROKEE.—The Garfield shaft is gow down over 180 ft, and drifts from it supply abundant ore for the continuous running of the mill. A still better quality is expected to be encountered at a greater depth.

THE BUTTE BAR LEDGE.—Plumas *National*, July 23: For some time past work has been prosecuted on the quartz ledge at Butte Bar, which created such an excitement 20 years ago. At that time the ledge was discovered at a point where the river canyon had cut it down, leaving the face of the ledge exposed, and fairly bristling with gold. The parties who found it became somewhat excited and put in a heavy load of powder to "shake it up," and they succeeded so well that the rich rock was blown into the middle of the Middle Fork. Considerable work was done at that time, and then the mine was abandoned. Last year some Virginia men were directed to it, probably by one of the original owners, and they have been prospecting it considerably, and have developed a splendid body of ore carrying sulphurets in large quantities, which are very rich. The mine is very extensive, but it is located in an out-of-the-way place, almost inaccessible at the present time. Those who have visited it claim that it will make a stir in quartz circles before long.

ELIZABETHTOWN.—The Loring & Leavitt claims, recently purchased by Corbin & Manson, are holding out fully up to all expectations, and proving that the new owners made a good investment. Although the company are working a large number of men, only a few of them are taking out gravel—the balance being engaged in putting up new hoisting works, getting timbers, etc. A shaft has been sunk near the Loring dwelling house, in the lower end of Betsy gulch, and the bedrock, at the depth of 18 ft, was found to be pitching sharply into the hill. From the bottom of the small shaft the sum of $6, in smooth washed gold, was panned out, and another shaft has been started farther back into the hill. A drift is being made to connect this ground with the main tunnel, and there is no doubt but that some big pay will come out of it. It is beginning to be pretty well demonstrated that the whole flat is a deposit of coarse gold and a splendid mine. We are glad to record the success of this claim, and hope the new owners will double their money a dozen times over.

SHASTA.

FLAT CREEK.—Shasta *Courier*, July 23: The Flat Creek mining camp has been, since its discovery, a flourishing one in placer mining, and, of late, splendid quartz developments are being made. At present Ellis & Brumfield, who have a fine ledge, have run in a tunnel and tapped their ledge at a depth of 100 ft from the surface, and find that they have a 3-ft ledge of good pay ore. E. O. Parker, who owns the two first discovery claims on the west end of the same ledge, has a shaft down about 60 ft, and some of the quartz, worked by arastra process, has paid at the rate of $17 per ton. As the vein at the bottom of this shaft is 4 ft wide and plenty of quartz in sight, this is considered a fine result. Next to Parker's comes the Murray Bros.' claim, on which they have sunk a shaft 140 ft deep, following the ledge all the way, and at that depth find their quartz 2½ ft in width and wall rock 6 ft from wall to wall and solid. Quartz from this ledge pays well from the croppings to the bottom of the shaft. Adjoining the Murray Bros.' claims follows the Ten Eyck boys, who are getting out timbers and commencing a tunnel to tap their ledge 200 ft below the croppings, the ledge having been prospected by shaft to a depth of some 40 ft. Doc. is at work on this claim himself and says that the ventilation and air on the mine discounts that of Redding, as a day's work don't require a tenth part of the puff and blow which his bellows performed when residing at the terminus. Altogether, the mining outlook for Flat Creek is most promising, and we confidently expect to see the camp support a large and thrifty population within a very short time, there now being some 30 men at work in that vicinity.

SIERRA.

NO IDLE MEN.—*Mountain Messenger*, July 23: Not an idle man, able-bodied and who desires work, can be found in Sierra county, and there is room for more to do service in the development of our rich quartz and gravel.

BORING MACHINE.—J. H. Thomas has a boring machine, 8 inches in diameter, on route from San Francisco, with which he will prospect the rich gravel ridge between La Porte and Gibsonville.

A LARGE number of miners from San Juan arrived in Forest city this week, and are now working for the Bald Mountain Co.

STARTED.—Steven Spencer, one of the owners of the Alaska quartz mine, near Pike city, was in town Wednesday, and reported that the new 20-stamp mill has just been started.

SOLD.—The Rising Sun gravel mine and the Hidden Treasure quartz mine, situated just below Loganville, have been sold to parties below. The price paid was $26,000.

MORE MEN.—The Bald Mountain Co. have recently put on a considerably larger force of men than they have been working lately. The work is done by the day, the price paid being $3.

THE Virginia Co.'s ground, Howland Flat, has been leased to Louis Cross for two years, at $3,000 per annum. Mr. Cross has a large force at work.

QUARTZ MILL.—A gentleman by the name of Hewston has purchased the Good Hope quartz mine and the Kanaka mill, belonging to the estate of Jo. Berg. The mill has been taken down and will be moved to this place and erected on the North Fork, near the bridge leading to Ben Pauley's sawmill. The site has been selected and the survey necessary to bringing in the water has been made. The site of the mill is immediately below the mine, and the rock will be lowered directly into it upon a tramway at a trifling cost. We believe it is the intention to have the mill running inside of 30 days.

REIS' RAVINE.—This other day we enjoyed a pleasant visit with Mr. and Mrs. Alexander, at Reis' ravine, on the road, via Saddle Back, to Howland Flat. Here at the dizzy elevation of 5,800 ft above Old Ocean, where snow fell 2 years ago to the depth of 25 ft (last year it was not more than 10), he raises onions, lettuce, peas, beans, tomatoes and many other kinds of vegetables. Irrigating water not over-abundant; that for mining purposes generally lasts from 50 to 60 days. The morning we were there Mr. Alexander found a $9 gold nugget. He showed us a larger specimen, 4 ozs., taken out of his diggings 4 years ago. All work is done on the top of lava, covering flunker hill and Sebastopol, and the labor thereon paid well this season. Fifty days was all the time put in sluicing gravel. It is figured by those who ought to know, that a tunnel, 1,200 ft in length, with about 150 ft of hard rock, would develop a large and rich field of gravel. Two hundred thousand dollars worth of gold has been taken out, on the lava, at Reis' ravine.

HOWLAND FLAT.—The hydraulic mines here and at Pine Grove have done as well as usual this year, which means a large profit above expenses that were 33⅓ of the gross yield. The Bonanza gravel lead is well defined, and the work of development being pressed with vigor under the able management of Supt. L. M. Stangroom. This mining property promises to become one of the best paying drift claims in Sierra. The Empire channel, on the same lead below, in 4 years yielded $140,000 in dividends to its lucky stockholders out of only 400 ft of channel. Main tunnel 4,800 ft in length. Eighty men are steadily employed, night and day. The extensive dump house, reservoirs and lengthy tail flumes are in excellent order. Water is obtained in ample supply from the Scare' Union ditch the year round. The California gravel claim, south of Table rock, is very, profitable, with a fair prospect of becoming of great value.

NEWARK.—Pilot Peak company are repairing their flume and reservoir. Their claim is bonded, but for only one-quarter of its value, the present owners being determined from developing their valuable property for want of means. The Enterprise gravel diggings paid well this season. The Old Washington le being prospected. The Swiftcure tunnel has been put in order, in old ground worked years ago, the back of which is being searched for pay. The North American company are realizing their usual handsome dividends, and employ a large force.

GIBSONVILLE.—Gibsonville water and Gravel Hill mining company. F. A. Gourley, Geo. W. Cox and J. P. DeNoon, have finished their clean-up. Result has come up to their most sanguine expectations. Gross proceeds, $36,000, one-third of which is dividends. The Nevada ground, about 30 acres, was lately purchased by these gentlemen. Fifty men have been employed all the season.

RICH HAUL.—Nineteen thousand dollars was recently realized from 100 square ft of bedrock in the Sears' Union hydraulic gravel diggings, Pine Grove.

THE MILL.—The material for the quartz mill for the Good Hope is coming down from Kanaka Flat. The mill is to be 20 stamps. The ore is to be taken down upon a tramway, the loaded car taking the empty one up.

CONTRACT LET.—The Eclipse company have let a contract to Mr. Farrel to run a tunnel in their mine, above Geodyears, at $15 per ft.

PHŒNIX.—We are indebted to Sheriff Fish for a fine specimen of gold-bearing quartz from the Phœnix mine, above Sierra City. The rock is extraordinarily rich in free gold.

THE Wilburn Con. shaft is down 150 ft. No bedrock has yet been reached.

THERE is some talk of resuming work in the fown gravel claim at Mt. Pleasant ranch. Parties who claim to be posted assert that those diggings will ultimately be proved among the richest in the county.

STEADILY PROGRESSING.—N. H. Ball, Esq., Superintendent of the Savage gravel mining company, called on us this week, reporting that their main tunnel is being vigorously pushed ahead between 25 and 30 ft per week through hard granite rock. The new air compressor works smoothly; also the Ingersoll drill.

MORRISTOWN.—The lats clean-ups at this noted mining camp have been very remunerative. Most of the ground was worked at Craig's flat.

TUOLUMNE.

NEW MINING ENTERPRISE.—Tuolumne *Independent*, July 23: A party of San Francisco men have styled themselves the Columbia M. Co., and have purchased the Stayton mine, near Five Mile creek. About 20 men are at work grading mill-site, preparing for double shaft, getting out lumber for mill house, hoisting works, boarding house, etc. The mill will be composed of 2 of Huntington's patents and Dodge crusher—capable of crushing from 12 to 15 tons in 24 hours through 40-screen. Engine and machinery on the way up from Oakdale. S. O. Brown is the superintendent. There are a number of good mining prospects in the immediate vicinity that are bound to be developed in the near future by some one.

MINE SOLD.—Since Messrs. Divoll & Co. have been so fortunate in their mining enterprise there are others who have a fearly hankering for some of the same sort. Mr. Mark Hughes, who purchased the old United States lot shortly after the strike, which is immediately adjoining the gold crop, and on the same vein, probably held the idea that the town patent gave him a clear title to the mineral contained therein, and that no one could invade his premises. However, he, not being so sure about this proposition, located several hundred ft of ground, including this lot—taking in the Episcopal church and all other city property to the Colby claim, which is located on the opposite hill, a distance of 1,000 ft, more or less, with 300 ft on each side of said lode. Mr. Hughes, not feeling able to open this property as it should be, leased the claim to a company of Stockton men, who have gone to work in earnest to see what there is in it. A few days ago the Stocktonians, at a depth of 100 ft, broke into the Bonanza works, when an injunction was served upon them. It seems that both companies are now claiming the same ground.

NEVADA.

WASHOE DISTRICT.

CON. VIRGINIA.—*Enterprise*, July 26: On the 2500 level are cutting out a station for the joint California winze; also, are running a south drift on this level for a sump; progress, 14 ft.

CALIFORNIA.—During the week 72 tons of ore have been extracted and sent to the mills; assay value, $35.

UNION SHAFT.—Cutting out a station at the 2700 level, and putting in foundation and pumps; also, easing timbers at the 2300 and 2400 levels.

ALTA.—During this past week we have sunk and timbered the shaft 13½ ft; total depth, 2,137½ ft. The bottom of the shaft is passing into porphyry, which will prove more favorable for sinking.

NEW WELLS-FARGO.—The northwest drift on the 500 level has been advanced 16 ft during the past week. On last Monday morning, July 18th, this drift cut through a well-defined clay wall, leaving the hard rock which the drift was started in and passing into soft vein matter—quartz, clay and porphyry—giving low assays. The face of the drift is still in the same formation.

YELLOW JACKET.—On the 2828 level they are employed in drilling east from the north winze. The hole is in 230 ft. The drillings give low assays. Are also cleaning out and timbering the south drift toward the Crown Point workings on this level.

HALE & NORCROSS.—The winze from the 2400 level has been sunk 13 ft; total depth, 86 ft. Water continues strong. Our main pumps are running steadily. The temperature of the mine has increased considerably since last report.

OVERMAN.—The drift on the 2275 level has been extended 53 ft. The ground slacks off so much that we have had to put in 9 sets of timbers.

CALEDONIA.—Pumps have been running on an average of 7 hours per day, consuming 3 4-7 cords of wood per day.

ANDES.—The west crosscut has been advanced 10 ft during the past week, and is now much better working than heretofore. The face of the drift is in quartz.

CHOLLAR-NORCROSS-SAVAGE SHAFT.—Have eased the shaft timbers on the north side at the 2400 level during the past week, and put in new suction pipes on the old pump.

SUTRO TUNNEL.—As the air in the main tunnel is quite hot, we are running a line of pipe from the blower to supply the timbermen with better air, and 700 ft of the same has been placed in position. On the 21st 3 carpenters commenced putting in a door and partition near the connection of shaft No. 2, for the purpose of making the shaft a downcast and improving the ventilation of the tunnel.

BRISTOL DISTRICT.

FUANACE.—Piocho *Record*, July 18: The Day furnace at Bristol fired up Monday last at 3 o'clock P. M.; at 6:20 they were dumping slag, and at 8:10 P. M. the first lead bar was cast. The furnace was started on low grade ores, waste, etc., and it is expected that on the 10th inst. the standard of the bullion will be attained, when bars will be cast for shipment. The Day and Mendha mines are improving as every stroke of the pick is made. The company has now about 800 tons of ore, 28,000 bushels of charcoal and 300 cords of wood on hand at the furnace, and intend to have that much in reserve all the time. The bullion will be shipped via Milford to San Francisco. Managing Director Orim is on hand day and night. He and Supt. Gould are working like Trojans to make the Day Co.'s enterprise a big success.

CANDELARIA DISTRICT.

NORTHERN BELLE.—*True Fissure*, July 18: There are being extracted and sent to the mille about 85 tons of ore daily. Both mills are running steadily, and doing their usual good work. Bullion shipments for the week ending July 13th amount to $21,595.98; shipments on July account to the 13th inst. aggregate $33,625.07.

MOUNT DIABLO.—In the north crosscut from the bottom of the winze, from the third level, a streak of ore has been cut through which assays from $70 to $100 per ton, the face looking more promising. On the 8th inst. $9,038.73 in bullion was shipped, and on the 12th an additional $8,133.58.

HOLMES.—The company has resumed operations, and is working a small force of men at present. It is understood increased energy will be put forward in a short time and the mine thoroughly developed.

ESMERALDA DISTRICT.

PROGRESS.—Esmeralda *Herald*, July 23: The mines on Silver hill are looking much better than ever before in the history of the camp. The Cortez is running on the ledge in 3 places, and the rock exposed in all is literally bespangled with coarse gold, in fact, much of it may be said to be gold, stuck together with a little quartz. The Centennial is improving very much in the bottom of the incline, and the ledge has widened out to fully 5½ ft between the walls, which are as perfect and regular as the walls of any building in the town. The Humboldt West still improves with work, and is undoubtedly a large and fine property. All that is necessary to make this one of the leading mining camps of Nevada is a good mill, so that we can send out some bullion.

THE CENTENNIAL.—Ore is getting much better and the ledge is widening.

CORTEZ.—The incline has been driven down 10 ft this week, and is 202 ft. The ledge in the bottom holds its width, and this ore will go many hundreds of dollars per ton. The east drift has been driven 9 ft in the same character of ore, making its entire length 58 ft, while the west drift has run 9 ft in ore, much of which will yield its thousands of dollars per ton, and none of it falling below $200. This drift is now in 73 ft in this character of ore. If this mine was located in some place where wood costs $30 a cord and water run in pipes 25 miles, it would have a 20-stamp mill running in less than 2 months.

THE HUMBOLDT WEST.—In the south drift on the 100 level fair progress has been made during the week. The same rich ore has been encountered as in the crossout on the same level. The ledge in the crosscut is 22 ft thick, and the ore will average $30 to $40 per ton.

MONTEZUMA DISTRICT.

ESMERALDA'S SMELTING CAMP.—Cor. *True Fissure*, July 16: Over two weeks ago the furnace of the Shawmut Co. was started up, and since that time has been running steadily. Its production has been an average of over 4 tons of lead silver bullion every 24 hours. In starting it required about 48 hours of experimenting with the ores to determine the mixture of fluxes and ores needed to give the best results. Since then the furnace has been running very successfully, and there is now molded and ready for shipment over 50 tons of lead silver bullion. This, I believe, is the first silver lead smelting furnace that has been started in the eastern part of Esmeralda county, but with a railroad through this section of the country many similar enterprises will be started. The present high rates of freight, however, operate against the mines high in lead and low in silver, as at present rates of freight lead does not more than pay its way to market. The furnace used by the Shawmut Co. is what is known as the water-jacket, which undoubtedly is superior to any other in use. This furnace was constructed by Messrs. Rankin, Brayton & Co., of the Pacific iron works, San Francisco, and like all the work of that firm is complete in detail and adapted to the requirements of practical work. This style of furnace has the capacity of more than any other for continuous work—the great desideratum for the effective and economical reduction of ores. This is regarded as a very important enterprise for this section of the country, and its success will call the attention of capitalists to the vast deposits of copper and galena ores which abound in this part of Nevada, as soon as made accessible by the rapid approach of the railroad. There are about 50 men employed at present by the company, besides the choppers and coal burners.

PIOCHE DISTRICT.

CLEANING UP THE MILLS.—Piocho *Record*, July 18: Jas. McFadden has taken the contract to clean up the 20 and 30-stamp mills of the Raymond & Ely Co. He will clean up the mills by Billy Keeler's new process, and Keeler is a partner in the job. Both parties went down to Bullionville on Monday and started in on the job.

BLACK ORE.—J. V. Keeley, according to orders, shipped a ton of Raymond & Ely black ore to W. S. Oodbs, at Frisco, Utah, last Saturday, where a dry test will be made of the ore.

WASHINGTON DISTRICT.

MILL RUNNING.—Esmeralda *Herald*, July 23: A gentleman in from Washington district, East Walker river, informs us that W. R. Rison has his mill running, but, everything being new, will have to run slowly for a day or two to get everything in running order. Mr. Rison's idea is, and has always been since he first saw the ore in this district, that the best method of getting the ore into cash was by concentrating the ores and shipping the concentrations to San Francisco, where they can be readily sold for from 80% to 90% of the assay value. He has several mines there and has tested the ores by shipping it to San Francisco, where it has been worked by every process known, and he is satisfied that by his present mode there can be the best results obtained. Mr. Rison has about 20 men employed, and will employ more as soon as he gets under full headway.

ENCOURAGING.—*True Fissure*, July 16: The news from this district continues of an encouraging nature. In all of the different locations now being worked ore assaying up in the hundreds seems to be the rule. Ell Johl has several locations, from the surface of which very fine ore is being taken. Joe McClane also has 3 locations, each of which at a depth of a few feet show assays that are marvelous. This district is easy of access, being situated on the south side of the Carson and Colorado railroad, and 10 miles east of Walker lake. It is 10 miles west from New Boston. The district was formed on the 27th of June by J. A. Thomasson, George Olsen, E. F. Griffin, P. L. Carroll, Richard Kelly, Ell Johl, J. C. McDonald, C. C. Radcliffe, James Davis, Stephen Walsh and John Hawthorne. During the present month the different prospectors now at work will have so far developed their claims that something of their permanent value will be known.

ARIZONA.

MACK MORRIS.—*Silver Belt*, July 10: Two new ore wagons passed through Globe, from Wilcox, for the Mack Morris Co., and laden with the last installment of machinery for the hoisting works for the Mack Morris mine.

SOUTH PIONEER.—The South Pioneer's condition may be approximated by a perusal of the following figures: 235 ft of exposed ore body on the 70 level, the average thickness say 2 ft; hight of drift, say 7 ft, making 329 tons. No stoping has been done except in the north end of the mine, and only a few tons have been taken out there. The South Pioneer M. Co. have purchased 150,000 ft of Oregon timber in San Francisco, and will soon have it at their mine.

ITEMS.—Geo. Scott has bonded the Pioneer mine for $75,000 to Eastern parties, who have paid a forfeit of 10%. The Stonewall Jackson is producing a splendid quality of ore. The full force of men will shortly be at work. The East Richmond is an extension of the Mack Morris. Its dumps, that of the La Plata and the Mack Morris are on the same line—the latter connecting the two. It is a strong, well-pronounced vein, with ore differing in character from what is found in the Mack Morris. Its greatest known width is 13 ft, which is on the 25 level in shaft No. 1.

COLORADO.

GRAY EAGLE.—Silver Cliff *Prospect*, July 15: Work is still progressing on the 250 level of the Gray Eagle mine. The crosscut has now reached a distance of 52 ft, and it is soon expected to cut the vein.

RACINE.—The Racine Boy mine still continues to show rich pockets of horn silver. Some very rich and handsome specimens have recently been extracted from that mine, which is one of the most remarkable in the West.

THE CROWN PRINCE, adjoining the Ouray, is about 80 ft deep, and the obsidian dyke is now changing to porphyry that is showing some manganese.

THREE carloads of the machinery have arrived at the depot for the Duryee furnace, and is now being hauled to the works. The other carloads are expected to arrive soon, and the work from now on will be pushed with vigor.

LAST March the Lacrosse and Green Horn consolidated, and then sold their properties to the Comargo company. The Lacrosse now owns other valuable mining properties on which they soon expect to commence work.

OURAY.—The recent developments in the Ouray are making a good showing. The rock yesterday contained a considerable quantity of chlorides. This property is owned by the Silver Prize Co., and Supt. Foss feels greatly encouraged over the results.

KING OF THE CARBONATES.—Yesterday the reporter visited the King of the Carbonates, located about a mile north of the city. Last year the main shaft was sunk to a depth of about 80 ft, and the vein carried some carbonates of lead that assayed high. A few weeks since a new vein was opened up near the old shaft, which contains copper and bromides of silver, and some chlorides were found yesterday.

FIRST IOWA.—A few days since work was suspended on the First Iowa, but Mr. Nevins, the Supt., yesterday informed the reporter that in a short time its development would be resumed. The main shaft has already been sunk to a depth of 200 ft, and the vein has slowly but surely been developing more richly.

CRYSTAL.—The Crystal, owned by the Galena M. Co., is about 100 ft deep. But little work was done on this claim last year, but the company is rapidly hurrying its development this summer and with favorable results.

IDAHO.

MIDDLE FORK.—Yankee Fork *Herald*, July 23: Messrs. John W. Stoddard, Richard Euler, Emanuel Fontesq, Isaac Daley and Patrick Dowling spent several days in town this week getting supplies to take to their camp on Middle fork. Those who came in brought several specimens of antimonial silver ore, which assayed as high as $5,000 and $6,000 per ton. They have located three mines on a belt which they have traced a mile and a half. The ledges are within 300 ft of each other, and from 1 to 8 ft in width. The ledge from which the rich specimens were taken is 8 ft wide, and the richest seam 18 inches. They have undoubtedly made discoveries that will not only attract a great deal of attention, but will create a stampede for that rich mineral country this year. The district is located about northwest of Cape Horn, where timber and water is abundant. To prospectors, we will say that the best route to the new El dorado is via Bonanza and Loon creek. The new finds there and near Prairie Basin show that the Bay Horse, Kinnikinic, Sawtooth and Yankee Fork belts extend over a vast amount of country, and that all that is needed to insure a population running way up into the thousands is the judicious investment of capital.

MONTANA.

LEASED AND BONGRO.—*Inter-Mountain*, July 16: The Olive Branch, a very promising prospect located near the Colorado smelter, and owned by Perry Blaine *et al.*, has been bonded within the past few days to J. P. Lawson, Prof. Clayton and S. A. Vaughn for the sum of $22,500, the bond to extend until the 1st of December. It is the intention of the bondees to begin at once the energetic development of the property. Another property which will likely come into early prominence is the Sheridan, located on the Black Chief ledge, 300 ft south of the Mountain Boy, and owned by Jake Reeding, *et al.* It has been bonded to Joseph Lecaff, Robert Fenner, John Hauswirth and Mr. Gagliolaino for $15,000. Eight men are now employed.

ALDER ORE.—Butte *Miner*, July 10: Messrs. Layton & Rice, owners of the Prospect lode, have just had a batch of quartz sampled at the Colorado smelter, which was taken from their mine. The mine is located about 1 mile west of Virginia City, Madison county, and shows a large vein of ore, with several hundred tons piled up on the dumps at different places. Messrs. Layton & Rice had about 10 tons hauled to the Colorado smelter—7 tons of first-class and 3 tons of ordinary ore. The first-class ore sampled $382.05 per ton—$276.45 in gold and $105.00 in silver. The 3 tons of second-class ore sampled about $100 to the ton. The bringing of the ore to the smelter was to test it, and a sufficient number of tons were brought to do it thoroughly. The sample value of the 10 tons was over $3,000, or $300 per ton. The experiment proved highly satisfactory. This ore will pay to haul quite a distance.

NEW MEXICO.

RINCON.—New Mexican *Mining News*: Rincon is fast developing into a promising mining district. It has been known for some time that a number of old mines in the district had been worked to a considerable depth by the Spaniards years ago, but nothing was done until recently to re-open these shafts. The whole district, however, is now alive with prospectors, and many new claims are being worked and some very high grade ore taken out. Just north of Rincon are the Coyote springs where the Bonaparte and Cave canyon mines are being very successfully worked. The ore taken from them resembles very much the celebrated black ores of Lake valley, and like those are also very rich in silver. Some fine gold is also seen in it without the aid of a glass. Rincon mining camp is now only 6 months old, but judging from the amount of work being done at present, and there is every reason to believe that it will be kept up, before 6 months roll around the district will be able to show some of the best developed and most valuable mines in New Mexico.

WHEN Bonanza city begins turning out bullion, which she will do next week, she will be on the high road to prosperity. Through the two years since the camp has been in existence the miners have been held back by being unable to realize anything from the ores taken out, and as soon as they can get money in return for the labor expended they will go ahead with a rush. In contemplation of the early operation of one of the smelters now being put up there, and the subsequent starting of the other, a number of contracts have already been let, and it is expected that during the next two months work will be livelier at the camp, and indeed all over the district than it has ever been.

OREGON.

BRIEFS.—*Democratic Times*, July 22: S. Arrasmith is working a bar near Wm. Augle's place, on Applegate. S. Carter has not sold his claim on Squaw creek, but only leased it. The miners of Gall's creek still have some water and have generally done well. A clean-up is being made at the Applegate M. Co.'s claims, now worked by Silva & Beck. Most of the miners of Sterling were in town Saturday, and report some cleaning-up still going on there.

UTAH.

PARK NOTES.—*Record*, July 16: In the Hawkeye the men are engaged in cutting a station on the 300 level. The lower tunnel of the Wasatch is now in about 800 ft. The workmen have encountered a body of hard quartz and they expect it will take them about 9 weeks to get through it. The Hidden Treasure is the name of a new discovery about one and a half miles southeast of the Jones Bonanza, which shows up as well as any prospect in the camp. A vein of 4 ft or are averaging about $20 clear across has been discovered on the surface. The Jones Bonanza comes to the front this week with the information that on Friday last the vein was cut on the 300 level, and measures 8 ft in width, the ore being of a much better quality than at any other point in the mine. The vein in the Bonanza has been cut down to the 400 level.

NAW ANTIMONY DISTRICT.—Salt Lake *Tribune*, July 21: This district is now looking well, and the present working of the mines show a marked improvement in the depth and width of this valuable deposit of antimony. This district has now about 50 miners employed, and can be reached via Milford, the end of the track of the Utah Central, in Beaver valley, thence by the way of Fremont pass to the Sevier river, and up the East fork of the same to Grass valley to the mines. The distance from Milford is about 60 miles, over a well-watered and timbered country. The scene through Fremont pass and up the Sevier river will cheer the heart of an old prospector. The wagon roads are in good condition, with speckled trout in every stream, and the sage chicken under most every bush. This district is situated in Pluto county, the first Gentile county in Utah.

Gillespie District, New Mexico.

A correspondent of the *Arizona Journal*, writing from Grant county, N. M., eays: Dietrict Gillespie is an infant of the tender age of six monthe in the family of mining camps, hut of euch health and vigor ae promises to deprive other members of that great family of mucb wealth and reputation. This camp was discovered in Decemher laet, and takes its name from one of the pioneers, Ed. Gillespie, who for 18 years has heen engeged in mining in California and Arizona. The main lead runs in a northwesterly and southeasterly direction, and is well defined in porphyry and limeetone. More distinctly defined, I am informed, than the famons Comstock lode. The ore containe native silver, horn silver, chloride and hlack sulphide. I am informed that there is practically no copper in the ore and that it is free milling. There are ahout 50 men in the camp, all doing well. In fact, I have never visited a mining camp whcro I saw a greater proportion of miners working their claims. All appear to have money and pay cash for their purchases at the store. The sale recentl- negotiated hy Gen. Rolline is destined to do much good. The purchasere, Gen. Gentar and Mr. Gentry, with their associates, propose to find out what is in their purchase without nnnecessary delay. They examined the surrounding conntry and eaw sufficient wood and water to justify the

Erection of a Stamp Mill.

Before leaving, they contracted for einking 100 additional feet in the shaft of the Snnrise Sonth. These capitelists purchased two mines, the Sunrise South of Michael Lane, Tom Manners, and two others, for $44,000; $4,000 down, the balance in 90 days; and the First Prize for $20,000; $1,000 down and the halance in 90 days. The First Prize is a ehort claim of 600 ft., lying between tho Snnrise and Sunrise South. It was the desire of Gen. Gentar and associatee to pnrchase the Sunrise of Ed. Gilleepie, hut they could not agree upon the price. There are

Other Promising Claims

In camp that are worthy of more extended notice than I can give in this letter. The Old Judge, owned hy Michael Horn and others, is parallel with and adjoining Gillespie's Sunrise. Not mnch work has heen done on this claim, hut good oro has heen taken from a shaft 10 ft. deen. Joe Ladue has sunk a 50 ft. shaft on the Homestake and developed a good showing. Charley Petere has made a good showing on his claims. Since leaving Gillespie I have met Mr. A. V. Comstock, who was foremau in the Bonanza mines of Nevada. Mr. Comstock visited Gillespie with Dr. Whittle, of San Francisco, extending hie visit through the week. He makes a good report on the camp.

Route to Gillespie.

Some of yonr readers may desire to know how to get to Gillespie. The most expeditious and comfortable way is *via* Lordsburg etation and Shakeepeare. After leaving Leitendorf'e wells there is a drive of 35 miles to Aleman springs before water is reached. The distance from Shakespeare to Gillespie ie ahont 60 miles over a plain road that cannot he missed if one does not persist in going wrong.

No Capital Wanted.—The Wood River *Times* says: Many persons in this section are looking for capitalists to take their property off their hands; they beg for capital, cry for capital, while if they turned to and went to work with a will they wonld donotless soon dig all the capital that they need out of their own ground The fact is, that to open our mines we don't need capital; our ores are enormonsly rich, and our mines pay from the very grass roots. All that is needed is a little muscle judiciously applied. If we ouly work vigorously we will open np mines enough this year to not only make ns independently rich, hnt to enahle ueto supply money to those very persone to whom we, in our present circumstances, would apply for linancial assistance. The lack of smelting works is hadly felt just now, to be eure; hut even these will come soon if we eiow up very much of the wherewithal to keep them going.

Meadow Lake.—Last Thnrsday a heavy sale of Meadow Lake mining property was made hy Messrs. H. K. Silvey, Charles A. Giffen and J. B. Giffen, of Truckee, to the Massachnsetts Con. M. Co., of San Francisco. Messre. Silvey *et als.* located the claims many monthe ago and have done more or less work on them ever since. Thero are eeveral locations inclnded in this sale. The Massechnsetts M. Co. is comprised of some of the heaviest capitalists at San Francisco. It is the intention of the company to commence operations on the property at once. It has often heen said that it was impossihle to make Meadow Lake ores pay, hut this company feel satisfied that it is a great mistake, and they propose to prudently demonetrate it to the eatisfaction of all adveree critice. When this company starte in with ite operatione we can confidently expect to hear of a hoom in Meadow Lake minee.—*Truckee Republican.*

The furnace at the iron mines near Clipper gap is turning out ahout 30 tone of pig iron per day. It is reported that the iron company has ordered from the East all the neceesary machinery for a rolling mill, which will he erected near the furnace. It ie the intention to manufacture railroad iron, gae pipe and euch other iron waree as will command a profit on thie coaet.

The Beet & Belcher M. Co., has received the United States mining patent for its claim.

Location and Lode Discovery.

In a recent case hefore the Commissioner of the General Land Office, an attempt was made to oust a locator, on the ground of illegality, hecause no vein or lode had heen discovered prior to location, and none had heen discovered eince. The Commissioner declined to order an inveetigation, because of the want of proper evidence, there heing nothing hut allegations to sustain the charge. In attempts of this kind to secure an investigation, the charge mnst be eustained hy the strongest kind of evidence.

In this connection, it is proper to say, that if the Commissioner of the General Land Office had a telephonic connection with every locator of a mine in the country, and was asked the qnestion, "What to do?" he would advise each snd all under any and all circumstances, to ohtain a patent the first thing, and hefore development. Why? Becanse it is likely to avoid vexatious and expensive litigation. It rarely occurs that an adverse claim is put in hefore a mine is ehown to he valuahle; then the claimants ewarm like mosquitoes, and, like that hird, are after hlood, and will pnt every ohstacle in the way of a legitimate locator to prevent him from ohtaining his owu. It is no exaggeration to say, that fully three-fourths of the adverse claimants to the mines have really no claim at all, but set up proceedings for the sole purpose of heing hought off, and in this they are too frequently successful, for their fraudulent claims cannot always he discovered in the land office, for it ie a simple matter to get up any required evidence by a comhination of interests. And this is really comhination work, for one who has great facilities for knowing what comee into the General Land Office, says that there are uudoubtedly organized hodies of men, whose sole husiness it is to get up adverse claims throughont the minoral regions. They have no other husiness, and eome of them have been very successful at it, *i. e.*, made fortnnes. It is one of the evils inseparahle from mining, and cannot be prevented eo loug as locators do not promptly ohtain a patent for their claims. Better far lose a little eomething on a felse lead occasionally, hy paying the expense of patenting, than when a good strike is made, be hampered hy a hand of unprincipled harpies ae hase as their unprincipled counsel.—*Cor. Inter-Mountain.*

Mines Under Bond.—There are no less then 12 promising Eureka mining properties under bond to Eastern and European parties. A number of these sales will he consummated within the next two or three months. Several San Francisco capitalists are anxious to secure properties in Eureka, and agents will shortly visit our district to eee what can be had. Altogether we ought to have something of a mining hoom here hefore snow flies. The steady dividends of the Eureka Con. and Richmond are attracting wide attention to our district and creating an impression that cannot fail of beneficial results in the end. No mining camp in America can to-day boast of two such productive mines as the Eureka Con. and the Richmond. If the Albion shall he added as a third dividend payer, which is not at all improhahle, the general prosperity will he greatly enhanced. The Geddes & Bertrand also promises to take a leading rank as a hullion producer during the fall months. Eureka's ontlook is as hright at this writing as at any time in its history. It ie true that husiness of all kinds is measnrahly overdone, hut this is in no sense the fanlt of the camp, or does it prove any leck of resources.—*Eureka Sentinel.*

Remarkaele Recovery.—We will not vouch for the followng etory going the rounds of the press; hnt as it is a matter of interost we give it: The whole scientific world and every visitor to the Smithsonian Institnte at Waehington is acquainted with the extraordinary recovery made some yeers ago hy a man in Vermont, who had a har of iron shot throngh his brain and yet lived many yeare. A somewhat similar case has jnst occurred in Montana. The telegrams, four weeks ago, reported that Patrick Mulligan, a miner, was pierced through the hody by a drill an inch in diameter, two ft. long, and weighing eight pounds, which fell eeveral hundred feet upon him. Soon after the accident occurred, and when he first knew there was a possihility of saving his life, he expressed the somewhat snperstitions helief that if the drill were polished and preserved, he would ultimately recover. To gratify hie hnmor, the hoys at the mine every day devoted a little time to the polishing of the drill, and it is now as hright and glisteuing as a uew eilver dollar, and Mulligan is we.l.

The Camp Carson mines, owned hy L. W. Nelson, of Salmon creek, near Baker City, Oregon, are located in the mountains toward the head of Grand Ronde river, and are in charge of Knm Lum, a Chinaman well experienced in mining. He is employing 15 men, hut will soon largely increase the working force. Thie mine hae the fineet water privilege of any mine in Eastern Oregon, and the ditchee cover a vast acreage of the very finest mining gronnd.

The Nevada *Transcript* of July 17th eays: "The Citizens' Bank yesterday shipped to the hay nearly $6,000 worth of gold hullion. It came from some 40 or 50 small claime in various localities hereaboute."

The Ontario Mining Co., is preparing to work 30,000 tons of tailings, which will yield $13.50 per ton.

Arizona Trees.

Our contributor, Prof. J. G. Lemmon, who, as our readers know, passed the early summer in Arizona, in the prosecution of hotanical studies, prepares for the *Arizona Journal* a valuable statement concerning Arizona trees and plants, as learned hy his latest researohes. He writes: Among the most intaresting discoveries made this season in the Arizona mountains are some facts which, though closely conuected interiorly, yet superficially may be put into two classee:

First—Distinct and hence *new* species of plants derived either from extinct families, or else differentiated by ages of isolation from kindred living plants.

Second—Remarkable *varieties*, almost amounting to specific differences, owing to peculiar local and climatic conditions.

Time will admit of only the merest mention of these two propositions, which, with adequate ability, might he elahorated into deeply instructive essays, perhaps.

Of New Species,

Over two dozen have heen detected in the monntains of Santa Catilina alone. These include plants of widely separate orders, from the tiny lichens eud the useful grasses to the lovely ferns and the more consequential shrubs and trees. Precise scientific namee cannot he given to all of these yet, until consultation of the authorities ie had; hnt many readers will not he sorry to mies the difficult Greek and Latin names, notwithstanding their appropriate descriptive eignification to the scientific reader. From the standpoint of utility, we would look at these discoveries from the hottom of the liet indicated, that is, take a glance at the trees and shrubs firet. But one hotanical explorer has before reported maple trees from within the limite of Arizona; yet a

Fine Grove of Sugar Maple,

Which may he dietinct, ie found in the deer park inclnded by the higher peaks of the Catalinas. Also, on the sunny slopee is seen a new and heautiful cypress, detected also hy Mr. Green on the White mountains, northward, I helieve. A sugar maple is reported hy the miners on the north elope of Doe Cahazes, in the Chiricahua mountains, which is perhaps the same as this of the Catalina. The writer has arranged to have leaves and fruit forwarded to him eoon, for determination, and may then report. The maple trees in the Catalinas are some of them one and a half ft. in diameter and 40 to 50 ft. high; of dark smooth hark, and long slender limhs. The leavee and flowere were just expanding when we first came npon the trees, amidst the melting snow banks, on April 30th; hut the treee had heen tapped hy two adventurous pioneers there, and we had a canteen of excellent sap and a fine article of syrup given us. This maple etrongly resemhles *Acer grandidentatum* found in Oregon, hut if it proves to he that species it has made a wonderful skip over the States of California and Nevada, where it is unknown.

Between thie clase of plants and the next stands a large and valuahle pine tree, which until lately was considered a variety of a certain white pine found on the Sierra Madre monntains, Mexico, but of late declared hy the highest authority (Dr. Engelmann) to he a dietinct speciee. This piue resemhles the common eugar pine ot California, but the cones are not half so long and, even when young, the scales are strongly reflected, suggesting the Doctor's new name for the epecies:

"Pinus Reflexa."

It is freqnently met with in the deer park referred to, also on a similar platean on Mount Graham, and ie reported also from several other ranges.

Among the eecond clese of plants—the remarkahle varieties—there is time to mention only one pine. In 1875 Dr. Rothrock, of the Wheeler survey, discovered on the Santa Rita monntains a pine tree having a strong resemhlance to the common yellow pine of California (*Pinus ponderosa*), hnt having its leaves in fascicles of five each, instead of three each, the number in the typical species. Coupling this character with others, derived from the smallness of the cone, etc., Rothrock judged the two to he distinct, and gave it the name of

"Pinus Arizonica."

Though admitting that his "data was very meager." Last autumn, Dr. Engelmann himself, with Prof. Sargent, visited the Santa Ritas, and hoth hecame satisfied that the pine was indeed distinct and entitled to he ranked as a new epeciee. Now, in the large inclosed forest of the Santa Catalina mountaius, we find pine trees of the appearance and description given for the *Pinus Arizonica*, inclnding the long, slender leaves in hundles of five; hnt, nnfortunately for the fate of the new epeciee, some of the leaves are in fascicles of all numhers from two to eeven! On examination of this foreet for eeveral days, every variety of character distinguishing thie polymorphons species was notcd; the eame as in the Sierra of California, with the added features of many-leaved fascicles and very small conee; eo we are compelled to helieve that the eo-called *Pinus Arizonica* is only a form, or, rather, a sport of the *Pinus ponderosa*, so variable in its forms in California as to have received there four or five names from the lumhermen, hnt all epecifically connected hy intermediate forms. Of course, we must not deny that the *Pinus Arizonica* may exist in the Santa Rita mountains, a range some 50 miles sonthward of the Santa Catalina; hnt certainly the presumption ie againet it, and the facts presented, we think, ebow the wonderful transformation powers of isolation and climatic conditions to whicb this speciee has hesn enhjectsd for ages, almost rendering it a distinct species. Fascicles of tbese pine leaves of different numbere and various lengths bave heen eent, accompanied hy the giet of the ahove notes, to Dr. Engelmann, Prof. Sargent, Dr. Parry, and to the California Acedemy of Sciences, from whom we may expect decisive reports.

The State Fair of 1881.

Preparatione for the State fair at Sacramento, Septemher 24th, are going forward, and the outlook for a fino exhibition is good. Ths premium list has already heen issued, and can he had hy addressing the Secretary, E. F. Smith, Sacramento. It shonld he consulted hy all producers, and the hest thinge in each department of production and manufacture eelectod to represent the industries of the State. For the coming session the Central Pacific railroad company will carry all articles and animals exhihited at the fair, over its respective routes, free of charge, and the same company will issue excursion tickets to all parties going to tho fair and returning, at ahout half price. Over $20,000 has been appropriated hy the officers of the society as premiums for the hest exhihits in the several departments of live etock, machinery implements, textile fahrics (mill and domestic products), and juvenile department, mechanical products, and California inventions, designs, etc., agricultural producte, horticultural products and fine arts. Liheral special premiums will be given for all worthy articlas exhibited, not mentioned in the schedule. Also, in addition to the premiums named, the society will give a gold medal to the most meritorious exhihition in each of the departments. Those who desire to compete for the gold medal in any department sbould make spacial entries for that purpose at the time of entering their goods for general premiums, so that the Gold Medal Committee may examine them more closely. The preparatione heing made for the fair are of a good character, and the season prohably will he one of mutual profit for both the society and the public.

A new featnre this year, and one which sbould attract the attention of California girls, is in the fact that J. McM. Shafter, President of the State Agricultural Society, offers a premium of $50 in plate, to the Miss under 18 who, unaided, makes the best loaf of white bread and the hest loaf of hrown bread. This practical contest ehould win many contestants.

Scarlet Snow.

All who have visited the polar regions are familiar with the appearance of red or scarlet snow, in those high latitudes. The broad fielde of everlasting snow that flank the northern coast of Greenland are flanked with the strange hlood red, and farther toward the poles miles of it stretch as far as the eye can reach. Tho phenomenon is due to the preseuce of a minute red animalcule in the snow. A microscope detects its presence, hut how it gets there is a difficult question and one that has never heen quite satisfactorily answered.

Until recently the only place in the United States where this pheuomenon has been ohserved is upward neer the summit of Mount Shasta. But the Leadville *Chronicle* of a recent date states that thie peculiar phenomenon has made its appearance in the Holy Cross county, in Colorado, a very elevated region in that Territory. That paper saye:

"The red snow in tbis region ie first ecen at the head of Cross creek, where it may he ohserved in patchee of intense carmine, varying in area from ae large as a man'e hat to 20 ft. in diameter. Taken in the hand and closely examined, nothing can he deteoted that gives it color, and it melts into clear red water, leaving no stain. Farther on, in some of the steep gulchee, with which the country ahounde, the hottoms are entirely covered with the strange substance. In some placee the color is vivid in the extreme, while in others it fades to a faint pink, producing an effect not readily described in words. Old prospectors who penetrated the regions two years ago, say that there was no snow of this description there, and its fall can scercely have antidated thie year. Still higher, and at the very foot of the monntain, the red snow disappears, and nothing save the pure white coverlet greets the eye. How the same tiny insects that appear in the polar regions can find their way to the inaccessible Holy Cross, is a thing heyond human ken, and will he a problem for the scientists of the future to ponder over."

It is proposed to mine out the hed of the main Stanisleus river, Tuolumne county, from the junction of the South fork, a distance of one-half mile helow. Aleo the South fork from its junction with the main, a distance of one-fourth of a mile or more, will he mined. To effect the object, a large flume will he conetructed, three-fourthe of a mile in length, with a capacity sufficient to carry the waters of both streams.

Last Thnreday a heavy eale of Meadow Lake mining property was made hy Meesrs. H. K. Silvey, Charles A. Giffen and J. B. Giffen, of Trnckee, to the Massachueetts Con. M. Co., of San Francieco.

Up to Jnne 23 the Eureka Con. bad shipped $106,021.40 in bullion.

Montezuma District, Nevada.

A correspondent of the Inyo *Independent* writing from Montezuma, Esmeralda Co., Nevada, says: On inquiry I learned that the camp for many years had been lying idle, for some cause which no one seemed to know. But things have now taken a new start, and the place is on a fair road to be one of the most essential mining camps in the State. The mountains, which bear the same name as the place, were discovered by a party of prospectors from Austin as early as 1867, and several valuable ledges were found which proved on being developed, of sufficient value to attract the attention of capitalists, who erected a 10-stamp mill in 1870. The principal mine found, proved on being more fully developed, to contain smelting ore. This required the building of a smelting furnace to make it pay, and yet matters lay idle for some time for want of capital. Last fall the Shawmut Milling and Mining Co. was incorporated in Boston to operate in Esmeralda county, Nevada. This company took hold of matters and began to push things ahead, but during the winter months very little could be accomplished, owing to the inclemency of the weather. Since spring has opened, however, under the superintendency of Mr. John Howell, well known to many of your readers as a thoroughly good mining man, assisted by Mr. I. M. Taylor, also a practical miner of many years' experience, matters have been pushed forward as fast as men and money could do the work. Good lumber could not be obtained in time in suitable quantities from other sources, therefore a platform was at once erected and saws put in order to commence sawing their own lumber, which was done, out of what is called nut pine. Sufficient lumber of this kind was soon sawed to answer the building purposes of the company very well. The first building to be erected was the smelting furnace. At the same time mines must be worked, good wagon roads made to them, boarding houses and other necessary buildings for the use of the company must be built, and all of which in so short a time has been successfully accomplished.

All things being ready and in good running order, the furnace, which for the last few days has been under the immediate direction of Mr. Thomas, a gentleman of vast experience in such matters, started up on the 21st of June. It was so successful that it surprised the most sanguine hopes of those who had helped at other places. Every part of the machinery was running like a top. Therefore, inside of four hours from the time the fire was first kindled, bullion was run into bars from the raw ore. In 24 hours, more than 70 bars of bullion were run out and piled up near the furnace, where everyone could see for himself. Each bar weighed near 100 lbs. The capacity of the furnace when running at its full speed is said to be 20 tons. Where is there a better showing on the Pacific coast than this has been so far, as indicating a successful mining camp? Yet the outside world does not seem to be aware that there is such a place in existence—that a mining camp is about to "spring up like mushrooms in June," and all without the aid of any newspaper boom, as has been the case with several of its sister camps, on information which said papers called perfectly reliable. I think that the prospects are very flattering indeed for this to be a lively mining camp before the summer months expire.

Every day the ax is heard in the surrounding hills, chopping wood. The smoke can be seen circling its winding way up the different canyons, giving evidence of numerous coal pits in the vicinity. The company at present is employing about 50 men, besides those who are burning coal on contract. The company furnishes wood, hay, etc., delivered to the parties, and pays eight cents per bushel for burning.

Wood River's Need.—The great need of this section at the present time is first-class sampling, smelting and separating works. To be sure there is a smelter in operation within a mile and a half of Hailey, but is only a ten-ton affair, and the company owning it lack the capital necessary to buy the ores offered for sale outright, and the ore producers are therefore compelled to wait fully 40 days before getting their coin. This, of course, deters many from extracting ore, as the claims are for the most part owned by men of no means whatever, who cannot open them up unless the returns are as prompt as sure. Were a strong company, with capital of say $100,000, to begin operations here, the miners would receive their coin on delivery of their ores, and a great impetus would thus be given to the development of the country. Works such as contemplated could not fail to prove enormously remunerative, as they would enjoy a virtual monopoly of the business for two or three years. Other works would soon be erected, to be sure, but the mines are scattered over such a vast extent of country that no crowding in any particular section need be feared.—*Wood River Times.*

An effort is to be made to build, with local capital, a railroad from Napa, Cal., to Lake *via* Berryessa valley. Certain capitalists from other points want to receive subsidies and construct the line, but the people have not accepted the proposition.

The Tuscarora *Times-Review* says: The sump has been cleared out in the Grand Prize shaft, the machinery is running finely, and the work of sinking has commenced in good earnest.

Useful Information.

How Slate Pencils are Made.

In making slate pencils, broken slate is put into a mortar run by steam, and pounded into particles. Then it goes into a mill and runs into a "bolting machine," such as is used in flouring mills, where it is "bolted," the fine, almost impalpable, flour that results being taken to a mixing-tub, where a small quantity of etentite flour similarly manufactured is added, together with other materials, the whole being made into a stiff dough.

This dough is kneaded thoroughly by passing it several times between iron rollers. Thence it is conveyed to a table where it is made into "charges," or short cylinders, four or five inches thick, and containing eight or twelve lbs. each. Four of these are placed in a strong iron chamber or "retort," with a changeable nozzle so as to regulate the size of the pencil, and subjected to tremendous hydraulic pressure, under which the composition is pushed through the nozzle in the shape of a long cord, and passed over a sloping table slit at right angles with the cords to give passage to a knife which cuts them into lengths. They are then laid on boards to dry, and after a few hours are removed to sheets of corrugated zinc, the corrugation serving to prevent the pencils from warping during the process of baking, to which they are next subjected in a kiln, into which superheated steam is introduced in pipes, the temperature being regulated according to the requirements of the article exposed to its influence.

From the kiln, the articles go on to the finishing and packing-room, where the ends are thrust for a second under rapidly revolving emery wheels, and withdrawn neatly and smoothly pointed. They are then packed in pasteboard boxes, containing 100 each, or 10,000 pencils in a shipping box. Nearly all the work is done by boys, and the cost, therefore, is light.

Why Stone Walls are Damp.—The walls of a stone house, and sometimes of a brick house, are covered with dampness. This is due to the very same cause by which dew is deposited on grasses, or moisture on the side of a glass or pitcher that is filled with ice water and is brought into a warm room. The walls become cold, and as stone is a non-conductor of heat, they remain cold for a long time. When the weather changes suddenly from cold to warm, the air becomes filled with moisture, for the warmer the air is, the more moisture it will absorb. When this warm air strikes the cold wall, the moisture is deposited on it from the air, which is suddenly cooled by contact with them, and as the warm air is continually coming in contact with the walls, the dampness accumulates until it appears like a dew upon them and pours down in streams at times. It is easily prevented. No plaster should be put directly upon brick or stone, but furring strips should be nailed to the wall and the lathe be put on these. Cellars are frequently made very damp in the same way by too much ventilation in warm weather.—*N. Y. Times.*

The Bell Clapper.—It has been supposed among antiquarians that the clapper is a modern addition to bells, and that it did not form a part of those employed in Japan and China. Henry O. Forbes, however, writing from Sumatra, says that when in Java a year ago he saw, in the possession of a gentleman there, a bronze bell dug up on the site of one of the old Hindu settlements, of which now only the graves remain. It had lost the clapper, but the hook to which, doubtless, the clapper was attached, existed still.

An Ancient and Unique Cannon.—The Governor of Cyprus has sent to England one of the oldest pieces of ordnance in existence. It is of cast iron, and weighs 25 hundred-weight. Its form is that of a cup or goblet, having the mouth wide and deep to receive a large stone shot, while the pedestal has a much narrower chamber for the powder. This chamber is 7 inches in diameter, extends 30 inches behind the mortar, and terminates in a vent at right angles fully an inch in diameter. It is probably of Venetian manufacture.

Salt is said to be a good preservative of timber. Fourteen years ago a Mr. Sterling, of Monroe, Michigan, placed two gate-posts of white oak in front of his residence. When they were set, he bored into the top of each with an inch and a half auger, a hole three inches deep, filled it with common salt, tightly plugged it, and covered the posts. Having occasion recently to change the location of the posts, he found them as sound, from top to bottom, as the day they were planted.

Cleansing Kid Gloves.—For cleansing kid gloves the following mixture is used in Paris: 200 grams soap powder, 8 grams aqua-ammonia, 135 grams sea de Javelle, 150 grams water. These substances are mixed, and a paste is formed, which, by means of flannel, is applied to the gloves and rubbed until they are quite clean.

To Burn Brick Dark.—While mixing the clay, spray a small quantity of a solution of one pound of common green copperas in four gallons of water. Or, use as a cheap substitute for the above, ordinary acetate of iron liquor.

Plumbing.

At a lecture on plumbing recently delivered before the National Health Society, of London, England, the lecturer commenced by saying that almost everything can now be done by machinery. The United States may be called the forcing-house of inventive genius. They have invented a machine for making a "welded" joint, but it is very inferior to the wiped soldered joint made by hand. Some plumbers never learn how to make perfect joints. In preparing the end of the inner pipe for jointing, all burr should be scraped off; no burr must be allowed to remain. The lecturer then explained the process of making wiped soldered joints. The solder used for upright joints should be finer than that used for underhand joints. To get a true ring round a pipe, a line must be drawn round. Pipes before joining should be well cleansed before applying the solder; "waste not, want not," is an old motto, and a good plumber should think of it in dealing with his solder, and should place the motto round his solder-pot. They should never put more solder round a joint than will be sufficient. Another motto they should remember was that, time is money, and they should study the quickest way of making a joint. In making an underhand joint they should have the pipe well warmed, coax the solder round and round to get the joint symmetrical, afterward they should wipe the joint with all the dexterity they can command, and keep moving the solder round and round on the cloth. One secret of success is to keep the solder close to the iron and keep it well heated by the iron. The plumbers of the commencement of this century did their work very well, much better than some of the present day. Overcast joints are now never made by good plumbers.

A Color Organ.—A musical instrument, called a color organ, has been invented. When the various notes are sounded by touching the keys, different combinations of colors are reflected upon a ground-glass plate, and these change and blend in a charming manner as a quick air is played. Thus two senses are gratified at once, and the beholder feels more than he understands the harmony between melody and color.

A New Test for Wool—Beetles.—A French entomologist asserts that the wool of different countries can be distinguished in market by the beetles which frequent the bales. He has identified 47 species in Australian wool; 52 in South African wool; 30 in South American wool; 16 in Spanish; and 6 in Russian wool.

Good Health.

False Exercise.

We use this term to express a contrast to natural exercise. Every part of the system requires exercise, and in order that exercise may promote health, it should generally be gentle, not violent. Animals, if left to themselves, take exercise that is general in the main; they run, frolic, kick up their heels, and play fight, and thus set an example for human beings, who contrive methods of partial exercise, and thereby produce partial muscular culture, and sometimes overtax one part of the system, while the other parts have too little activity. We have entered gymnasiums and seen young men struggle to put up dumb-balls, weighing perhaps 100 lbs. Now, this requires a very powerful effort, and tends to wrench the spine and produce an undue exertion of a part of the muscles, those of the chest and loins in particular. Some may say that the gymnast alternates the arms; but we answer by saying that because one strains the muscles of the right arm by excessive lifting, there is no reason why he should strain the opposite muscles by undue lifting with the left arm. If men would lift a pair of dumb-bells weighing, say 10 lbs., one in each hand, and then make the use of the muscles equal, simultaneous and harmonious, and all within the just limits of power, it would be much better than to strain and struggle to put up one heavy affair.

A great objection to the usual exercises in the gymnasium is that the chief desire seems to be to outdo everybody else, and only those who are specially well endowed with muscular power make any show at all. * * *

We like what are called "free gymnastics." The horse, the calf, lambs and kids have free gymnastics. * * * Free gymnastics are a series of exercises without dumb-bells, clubs or other apparatus. In this method persons are not obliged to overwork. To practice this let the person stand erect, fill the lungs and strike out first one arm and then the other, then both, then advance one foot and strike out with one hand and then the other, and thus take exercise with the shoulders, arms, back and legs. Persons can thus take abundant exercise and bring themselves to a state of perspiration, and at the same time incur no danger of a strain. In these methods the action of the muscles is harmonious, and may be vigorous or gentle, and always useful; besides, it costs nothing in the way of apparatus or tuition, and can be taken every night and morning and at midday by teachers, students, clerks, literary men, and all girls and women.

A series of such exercises every day would tend to build up the muscular system better than taking irregular exercise at a gymnasium once or twice a week, where one is very apt to be led to over-exercise. When a person is half dressed in the morning, or half undressed at night, he can take exercise that will make the blood fairly tingle in the extremities, relieving the brain and vital organs, especially the digestive organs, and thus promote sleep at night, and growth and vigor during the day. * * *

People as they advance to old age should take easy, active exercise. One who walks considerably, keeps his feet and legs in better condition than those who keep themselves housed up and sit a great deal, or always ride when they can. Nothing shows age more than a tottering step, and he who keeps his legs in good working order by a good deal of walking, manages to keep up a very general circulation, and, of course, promotes the general health, and in this way will avoid many of the pains which age is usually made accountable for. If a man use his bones and muscles as he advances in years, he is not half as likely to fall; or if he fall, to break a bone, because the bones are kept in healthful condition by means of daily exercise. Everybody knows that if the arm be suspended in a sling, from any cause, it becomes soft and flabby. In the same way the bones become weak and brittle by non-use, nature declining to furnish them with food or nutritive support if they are not called into use. If an elderly person can stand well on his feet, be brisk and nimble in walking up and down stairs, he not only has more comfort and independence, but appears better, more vigorous and younger, and isn't half as liable to accidents as those are who, by taking but little exercise, become clumsy, awkward and ungainly in their walk.—*Phrenological Journal.*

Importance of Sleep.

There is no fact more clearly established in the physiology of man than this, that the brain expends its energies and itself during the hours of wakefulness, and that these are recuperated during sleep; if the recuperation does not equal the expenditure, the brain withers—this is insanity. Thus it is that in early English history, persons who were condemned to death by being prevented from sleeping, always died raving maniacs; thus it is also, that those who are starved to death become insane; the brain is not nourished, and they cannot sleep. The practical inferences are three:

1st. Those who think most, who do most brain work, require most sleep.

2d. That the time "saved" from necessary sleep, is infallibly destructive to mind, body and estate.

3d. Give yourself, your children, your servants, give all who are under you, the fullest amount of sleep they will take, by compelling them to go to bed at some regular, early hour, and to rise in the morning the moment they *awake of themselves;* and within a fortnight nature, with almost the regularity of the rising sun, will unloose the bonds of sleep, the moment enough repose has been secured for the wants of the system. This is the only safe and sufficient rule; and as to the question *how much sleep any one requires,* each must be a rule for himself; great nature will never fail to write it out to the observer, under the regulations just given.—*Journal of Health.*

Decay of the Teeth.—The acids which cause the decay of the teeth are conveyed in the secretions of the gums and the mucous membranes of the lips and cheeks, and the penal points of attack are in the interstices and the grooves in the facial walls of the teeth. The calculary nature of the saliva is antagonistic to the acids, and preserves the teeth from their dilapidating influence. Teeth are protected from disease by the following conditions: Their regular shape and order, that the situations for the deposit of acids be as few as possible; the conservation of the teeth from noxious influences by constant brushing; the healthy structure of the tooth itself, and of the mouth generally. Hcider observes that the yellowish white teeth are less subject to the attacks of caries than those of a bluish shade, the enamel of the former being much harder, and the molars have been found to contain more mineral substance than the incisors.

Is It So?—A foreign scientific journal remarks, as a curious physiological fact, that although open-air life is so favorable to health, yet it has the apparent effect of stunting the growth in early youth. Thus, while the children of well-to-do parents, carefully housed and tended, are found to be taller for their age than the children of the poor, they are not so strong in after years; the laborer's children, for instance, who play in the lonely country roads and fields all day, whose parents lock their humble doors when leaving for work in the morning, so that their offspring shall not gain entrance and do mischief, are almost invariably short for their age; the children of working farmers exhibit the same peculiarity. After 16 or 18—after years of hesitation, as it were, the lads shoot up, and become great, hulking, broad fellows, possessed of immense strength. According to these statements, it would seem that indoor life forces the growth at the wrong period, and thus injures. Is it so?

The actual gold yield of California since its discovery in 1848, is a matter that can never be ascertained; but it is of record that the amount deposited in the mint up to 1880 was over $900,000,000.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Safety Attachment for Mine Cages; The Richmond-Albion Decision; Pillow Blocks for Mining Machinery Shafts, 65. Passing Events; Silver Amalgamation; Tucson District, Arizona; Contributions to the Geology of California; Prospecting in California, 72. The Placer County Iron Mines; The Date Palm in California, 78. Patents and Inventions; Notices of Recent Patents, 76.

ILLUSTRATIONS.—Brown's Safety Attachment for Mine Cages, 65. The Date Palm in California, 73. An Improved Step Ladder, 76.

MECHANICAL PROGRESS.—Buying Second-hand Machinery; The Proper Use of Iron in Building; Steel Boilers in France; The Strength of Small Spruce Beams; The Shop Foreman; A Plastic Metal; Temperature of Least Resistance in Steel; Increasing Use of Steel, 67.

SCIENTIFIC PROGRESS.—The Comet; New Theory of the Production of Steel from Wrought Iron; An Interesting Property of Gutta Percha; Coating Copper with Iron; Heating Effects Due to Compression; The Acid of Fungi; The Possible Source of Coal Oil, 67.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Dividends, 68.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Montana, Idaho, Oregon, New Mexico and Utah, 68-9.

USEFUL INFORMATION.—How Slate Pencils are Made; Why Stone Walls are Damp; The Bell Clapper; An Ancient and Unique Cannon; Cleansing Kid Gloves; To Burn Brick Dark; Plumbing; A Color Organ, 71.

GOOD HEALTH.—False Exercise; Importance of Sleep; Decay of the Teeth, 71.

MISCELLANEOUS.—Mining Company Reports; Advertisements and Adverse Claimants; California, 66. Gillespie District, New Mexico; Location and Lode Discovery; Arizona Trees; The State Fair of 1881; Scarlet Snow, 70.

Business Announcements.

Delinquent Sale—Steep Hollow Gold Mining Company.
Highland Springs—Mrs. J. C. Goods.
Cylinder and Spindle Oils—Tatum & Bowen, S. F.

Passing Events.

Among mining men the matter of the pending suit between the Richmond and Albion mine, Eureka, has been a topic of interest. The decision, rendered in favor of the Richmond, is given in another column.

On the Comstock work is going on uninterruptedly, but they are a long time unearthing any bonanza.

At the Belcher the work of cleaning out the drift on the 2500 level, connecting with a drift from the Overman, has been commenced. Now, Supt. Jones is making every exertion to clean out this drift, when he will make connection with the Overman drift by means of an upraise, and thereby secure a good circulation of air at that depth. This connection will allow both the Overman and Belcher to enter and prospect entirely new ground, and it is the intention of the Belcher to do so as soon as a circulation of air is secured that will permit of men working in that direction to advantage. It will take about six weeks to put the drift in condition for work.

We give in this issue the reports of a number of mining companies. We also give a very interesting article on the iron mine in Placer county by Mr. Hauks, State Mineralogist. The number of the new series on "California Geology," by Prof. Blake, will also be found worthy of perusal.

The President continues to improve rapidly and now appears entirely out of danger.

The Mechanics' Institute fair, which opens next week, is an event of importance to all classes, illustrating and indicating, as it does, our industrial progress. The fair opens on Tuesday, and continues for four weeks and four days.

Our readers will be interested in reading the report of Mr. Hamilton Smith, Jr., on the brush dam of the Yuba. From his examination he concludes that it will accomplish the purpose for which it is intended. Col. Mendell also concurs in this opinion. The opinion of these two experts is of more weight than that of all the interested politicians and lawyers put together.

The Mechanics' Fair.

The 16th Industrial Exhibition of the Mechanics' Institute will open on Tuesday next. The opening exercises will be held at the Grand Opera House, Mission street, near Third, at 2 P. M.

This exhibition will probably be the most complete ever held in this city. The manufacturing enterprises of San Francisco are now steadily increasing in number and in importance, and there will be a full representation. Of mining appliances there will be also a pretty full exhibit. At this writing the pavilion is in rather a confused state, but matters are as far advanced as usual at this stage of affairs.

Dewey & Co. have been granted the privilege of publishing the *Fair Daily*, a journal, as its name indicates, devoted to the interests of the 16th Industrial Exhibition. It will contain, in addition to current news of the fair, etc., descriptions of all the important exhibits, and give details which will be of interest to preserve. As the fair is always well attended, we advise people to purchase their season tickets at once before they spend more than one costs.

Silver Amalgamation.

The first works erected in Europe for the treatment of silver ores by amalgamation, appear to have been those described by Schlüter as having been put up at Kingsberg for the purpose of treating the stamped ores of that district.

This apparatus consisted of 18 small cylindrical vessels arranged in a circle, in which the ores were mixed with mercury, and kept in a state of constant agitation by means of a vertical spindle in each tub, the whole being worked by a large toothed wheel in the center. It was not, however, till the latter part of the century that the attention of mining engineers on the Continent became particularly directed to the process of amalgamation. In the year 1780, Phillips says, the Baron de Born suggested to the Austrian government the propriety of adopting this system in the mining district of Hungary, and at his solicitation some experiments were instituted at the Glashutte Works, near Schemnetz.

Although these trials were not followed by the introduction of this system of amalgamation into the Hungarian mines, they nevertheless gave rise to many valuable discoveries, of which the Saxon government, which had deputed a commission to attend on De Born, availed itself in the erection of the works at Freiberg.

The first works were erected at Freiberg, in the year 1790, under the direction of M. de Charpentier, but these were destroyed by fire shortly after completion. The amalgamating works, commenced immediately after the destruction of the former, were completed in 1794, and closed down in 1856. The amalgamating of silver ores was at one time more economically conducted at Halsbrucke Works, in the vicinity of Freiberg, than in any other European establishment.

Tucson District, Arizona.

In conversation, this week, with a miner from the above named district, we learn that the principal drawback to the locality is—what is the case in many other places—the lack of reduction facilities. There have been a great many men prospecting there, but as they cannot get their ore worked, many are now idle.

The district is on the west slope of the Patagonia mountains. The miners hope for some relief from the Atchison, Topeka & Santa Fe railroad, which will probably go along the base of the mountains about 15 miles from Washington Camp.

There is a very heavy mineral belt in these mountains, entirely undeveloped, as yet. The men who get ore out can do nothing with it. There is plenty of timber and water, and the district is quite a large one, being some 15 or 20 miles square. It comprises the Calabasas tract as well. There are several camps in the district.

All the "prospects" are new ones, none of them being developed to any extent. None of the mines are being put on the market. As soon as they are opened up there will be some very good properties indeed.

The ore from the ledges is all free milling, and ledges from 20 to 30 ft. wide are not uncommon. In the larger ledges the ore will run from $50 to $100 and in the smaller ones it runs often from $400 to $500 per ton in silver. The district is reached from Tucson by way of Tuhac, and is easy of access.

This is one of the districts where a man with a good custom mill would help the miners greatly, and probably make a good fortune for himself.

Contributions to the Geology of California.

New Series.—No. 4.

Chinese Camp to Sonora.

H. G. HANKS, STATE MINERALOGIST: In my last communication the course of the mother lode was followed from Coulterville to Chinese Camp, and it was shown that for most of the distance northwest of Penyon Blanco the lode does not crop out strongly, and appears at intervals only. The formations, however, continue unchanged, and the line of the lode is east of Chinese Camp.

Section to Jamestown.

Leaving Chinese Camp and passing northeastward nearly at right angles to the strike of the rocks, we first cross the eroded outcrops of the conglomerates, and then over a belt of slates standing on edge, but presenting an almost flat surface, greatly resembling the outcrops at Merced falls. This smooth and apparent planed-off outcrop is in strong contrast with the sharply serrated edges of the slates standing above the soil like tombstones, generally known among the miners as "grave-stone slates." The difference of surface is very likely due to a difference of internal grain; the absence of the elongated structure made by pulling or stretching the strata during the period of plication, to which we may refer the sharp ellipsoidal outcrops of the slates in a great part of the gold region.

Beyond these outcrops, north and west, there is a belt of greenstone conglomerate, succeeded by serpentine, apparently the prolongation of the serpentine belt traced northwestward from Coulterville and along the Tuolumne. Pliocene gravel also makes its appearance in remnants of a tableland formation, and a short distance beyond, the lava-capped beds of Table mountain bound the view from north to west.

Mother Vein.

Thinly-bedded clay slates come to the surface east of the serpentine, and continue up to the outcrop of the mother lode, about one mile west of Jamestown. The lode at this place crops strongly, and forms the crest of a ridge, upon the flanks of which there are heavy deposits of quartz gravel, evidently derived from the disintegration of the vein. The many pits and trenches in this gravel clearly indicate its valuable auriferous character, and at the same time, show that the vein is not a mere barren outcrop of quartz.

The vein is accompanied by many branches and veinlets penetrating the adjoining slates in various directions. It follows the formation and trends northwest toward Table mountain, under which it disappears. It would be interesting to ascertain what the fineness of the Table mountain gold is, compared with the fineness of the gold from the vein. There can be little doubt that the Table mountain deposit was greatly enriched below the mother vein by the gold broken from its croppings upon the banks and in the bed of the ancient river, along which the deposits and lava overflow of the present mountain were formed.

Jamestown.

The lode is in the midst of the clay-slate formation which extends to and beyond Jamestown. East of this place the slates become harder, more massive, and are traversed occasionally by quartz veins. All the formations trend toward Table mountain, and are there covered from view. As the slates become harder, the surface of the country rises from 1,400 ft. elevation at Jamestown to nearly 1,800 ft. at Sonora. This may be done in part to a very hard dyke of dioritic rock just west of the town. Sonora is built upon hard, massive black slates, resembling those beyond Priest's, and at the Hite mine, belonging, I believe, to the most eastern belt of slates of the Sierra; these black argillaceous slates are firm and hard enough to be quarried for building purposes. They are gold-bearing, and, at the present time, there is a most notable development of a vein within the town limits, from which fabulous amounts of gold are taken by two men, the metal being so abundant that but little crushing in a hand mortar is required to free it from quartz.

Sonora Limestone.

The limestones at Sonora bordering the slate formation on the east, constitute one of the most interesting geological formations of the State. They are here developed over a considerable area and stretch for many miles to the northwest, to Columbia, Shaw's Flat, Murphy's and beyond; and southeastward it is believed to reach to Hite's Cove and beyond it, though I have not traced them in that direction. In a section which I shall hereafter give, from Mariposa to Hite's Cove, I shall show the similarity of the formations; that there are several distinct strata, or beds, and that some of them abound in fossil encrinities. The Sonora outcrops have failed, so far as I know, to give any evidence by fossils of their age or place in the geological scale. There is no doubt, however, of their deep sea marine origin. They show distinct stratification and alternate layers of gray, white and blue color. The stratification is nearly vertical and the beds being of differing degrees of solubility now present a very extraordinary and uneven surface especially where in the flats and valleys they were covered with alluvial gravels and clays. In such places, notably in Columbia and Shaw's Flat, the outcrop consists of a succession of sharp, irregular bodies of limestone, separated by deep, fissure-like chasms. The masses, in many instances, seem like loose bowlders, and where the soil and gravel were removed by mining, they toppled over. Such a surface proved to be wonderfully retentive of placer gold, and the harvest from this strangely irregular surface of limestone was very great. Miners have worked the crevices to great depth, and there is reason to believe that the bottom of many of the chasms has never been reached. A similar formation occurs in the Ural mountains, and was described by Sir Roderick Murchison. A reference to this and a more complete notice of the Sonora deposits, with figures, will be found in my report to the United States Government in 1853 to 1855.

The cause of the uneven surface is not as generally supposed, mechanical wearing away, or erosion, but is chiefly chemical. It is due to the solvent action of carbonated water percolating through the soil or standing in the undrained and swamp-like flats. As the rock was dissolved the gravel and gold sank down into the cavities and crevices far below the surface upon which they were originally laid down.

Pliocene Fossils.

At the time of my first visit, in 1854, the whole limestone belt was populous with miners, and many relics of the Pliocene age were brought to light and were often lost to history and science. These for the most part consisted of teeth of elephants, the mammoths and of the mastodons of primeval days, when they roamed through the forests and glades of California with the tapir and hipparion. Whether the progenitors of the modern Digger Indians were "there to see" is still an open question, though some cracked skulls are thought to bear evidence on this point.

Relics of Humanity.

The late Dr. Snell, of Sonora, was an enthusiastic collector of aboriginal stone implements and relics which have been peculiarly abundant about Table mountain, and were supposed by the doctor to be of great age, even antedating the lava flow. This, however, is very doubtful. As the subject is very interesting, and the facts are important in the discussion of the antiquity of man upon the globe, I propose to make them the basis of a separate contribution.

Since the death of Dr. Snell, his collection appears to have been scattered. I did not find in Sonora, anyone who could give me an account of it. Casts of some of the specimens have been sent to the Smithsonian Institute; and the doctor presented me with a collection of specimens some years before his death. At the same time, I made exact drawings of some of the more important pieces, copies of which I will send you for publication in your annual report.

WM. P. BLAKE.

Prospecting in California.

Mono, Inyo, San Bernardino and Fresno counties now have many prospectors hunting over their mountains in search of quartz. There is a very large area of territory comprised in the region mentioned, where there is room for a good many men to work without tumbling over each other. There are hundreds of billsides and canyons worthy of diligent search and careful examination by experienced prospectors. The rich mines that have not been found are waiting for them. The amount of territory which has only been walked over and never thoroughly prospected, would surprise those who have never done any prospecting and do not know what hard work it is. Many men who have quit work on the hydraulic mines have wended their way southward and started in on the mountains of California looking for quartz.

The following paragraph from the Homer *Index*, published at Lundy, Mono county, shows the direction the prospectors are taking: The prospecting fever is on the increase, and has become epidemic. Every day parties start out on expeditions which they apparently desire to keep secret, but at the time, their destination is as well known as if it were proclaimed by the town crier. Hitchy-Hatchy valley is now the Dorado of imaginative treasure seekers. Wonderful stories of wonderfully rich ledges are current among those who have never seen that rugged and almost inaccessible country, but few of them have any more substantial foundation than guess work. Nothing of value has ever been found in the region where the Tuolumne river has its source; but on the western slope of the Sierras, along the range where the granite of the mountains and the slate belt of the foothills meet, there is a large scope of country which has never been prospected, and where the chances for finding rich veins of quartz are good. Some of the best mines in the State lie between slate and granite.

THE Iron mine, Bristol district, Nevada, is gradually improving as depth is attained. A large body of lead ore has been lately encountered in running south drift from bottom of shaft No. 1. The ore in the face of drift averages $75 to $150 and carries 60% in lead. The drift will be run in on ore for a few days, and then crosscutting will be commenced to ascertain extent of ore body.

THE Hardscrabble mine, Igo, Shasta county, cleaned up the last of June, $12,000,

The Placer County Iron Mine.

An Important New Home Industry.

[Written for the PRESS by HENRY G. HANKS, State Mineralogist.]

No person acquainted with the subject can form a correct idea of the magnitude of the plant required to produce common cast iron economically; or the cost of such works. If informed that several hundred thousand dollars can be used in the construction of a first-class iron furnace, the figures would seem excessive, but in the manufacture of steel, which is simply cast iron purified, the cost of the plant is still greater. A moderately complete Bessemer works is worth $500,000 and upward. Very complete and perfect works at Joliet, Ill., cost $2,250,000.

The modern iron blast furnace is a marvel of scientific and mechanical skill, which seems to have reached a state near to perfection. While its first cost is very great, the vast amount of work that can be obtained from it admits of a satisfactory profit on the capital invested.

The Newly Constructed Iron Furnace

In Placer county is as complete and perfect as can be made by united capital and skill. The name of the company is the California Iron company. The capital employed is owned by the following well-known San Francisco business men—Egbert Judson, Irving M. Scott and A. P. Hotaling. The works are located about six miles from Auburn, and about four miles from Clipper Gap. The exact locality is the northwest quarter of section 15, township 13 north, and range 8 east, Mt. Diablo base and meridian. The mines and furnace—then in an unfinished state—were visited by the State Mineralogist in October, 1880, and again in May 18, 1881 when in full blast.

The furnace is know as a "charcoal hot blast iron furnace." It is a perfect duplicate of one built in 1873, on the Menominee river, which forms the boundary between Michigan and Wisconsin. The California furnace was built by Mr. James M. White, of Rochester, New York, who has proved himself admirably fitted for the work and worthy of the trust. Mr. White has been employed for years at the East in the construction of iron works, and to him is due the entire credit for the building and management of the California furnace. The credit for the inception of the enterprise is due to Mr. P. Fitzhue.

The Early History

Of the Placer county iron deposit is interesting. It was first noticed in 1854 by Mr. S. W. Lovell, then president of the Bear River water and mining company. It was located two thirds in the name of Caleb T. Fay, and the other third for John Bell. In J. Ross Browne's report, published at Washington in 1868, considerable space is given to it, and the attention of capitalists called to its importance. Arrangements had been made at that time with Coffee, Risdon, & Co., to erect a furnace to test the ore, the plan, however, was never carried out. Mr. P. Fitzhue came up in 1874 to examine the deposit, attracted by the report of Prof. Whitney in the volume of General Geology of California, one example of many known to the writer of the practical utility of the State Geological Survey. A company was incorporated known as the "Iron Mountain Iron company." The names of Judge Meyers, J. R. Brown, Geo. Applegate, Chas. Robinson and A. C. Neil, appearing as incorporators. The property came into the possession of the present owners in the winter of 1879-80.

A Blast Furnace Consists

Essentially of two parts. The boshes and the cone, which combined form the column, the full hight of which is 47 ft. The widest part of the interior diameter is 10 ft.

The minute details are technical and cannot be correctly described by one who is not familiar with them. The weight of the upper part of the furnace is supported by massive columns of cast iron, the exterior is of iron lined with fire brick.

From a point near the top, a large boiler-iron pipe called a "down comer" conveys the gases generated in the furnace downward to the hot blast, and to the chamber under the boilers. Gravity doors, or "explosion doors," as they are called, are placed at frequent intervals, which open harmlessly and prevent damage. This is an extremely ingenious contrivance, without which it would be impossible to use the furnace gases found by experience to be both convenient and economical. The gases are brought down to the hot blast and boilers by the natural draught of tall chimneys 100 ft. high. The hot blast arrangement consists of a combustion chamber of 700 cubic ft. capacity, in which 56 tons of iron pipe are coiled, through which 4,000 cubic ft. of air per minute is forced by a compound blowing engine driven by a 125-horse power steam engine. The fuel used is wholly the product of the furnace brought down by the down comer, and burned under the boilers and in the combustion chamber, being regulated by the admission of atmospheric air through a graduated aperture, the management of which requires much skill and experience. As explosive mixtures of gas and air are frequently formed, the before mentioned explosion doors are a necessity. The temperature of the air is readily brought to from 800° to 1,200° at pleasure. At either temperature the pipes are cherry red.

There are five tuyeres entering the furnace at the base of the boshes, through which the powerful red-hot blast is forced beneath the burning charcoal. This blast is kept up (except at short intervals while casting), night and day, as long as the furnace runs.

A small handy engine of 30-horse power does the little chores about the place, the most important of which is the driving at intervals of an Eclipse rock-breaker for reducing the size of the lumps of ore and limestone.

The Upper Part of the Furnace

Is circled by a balustrade of boiler iron, forming an elevated platform above the roofs of the surrounding buildings, like a castle with battlements, upon to the air in all weather, any rainfall being rendered harmless by the great heat. To this level the food of the monster is hoisted. In the center of this charmed circle, ton upon ton of iron ore and bushels of charcoal are cast at short intervals into an insatiable mouth in a succession of carefully weighed charges. The mouth is closed by a conical cover shutting upwards from within, and held in place by a movable lever, which is nearly balanced at the outer end by a weight. When the charge is thrown upon the cover, it slowly sinks, and the coal and iron fall into the furnace down the conical sides of the "bell," as it is technically called. The weight at the end of the lever immediately brings it to its place, the only escape from the furnace being an angry puff of black smoke and an ebon cloud of charcoal dust. This operation intended to be automatic, is assisted at times by a workman, who gently lifts or lowers the lever as occasion may require. The whole furnace is surrounded by an atmosphere of heated air—not unbearable, but tropical above the fer-

THE DATE PALM IN CALIFORNIA.

vency of the summer sun. There are two pipes towering high above the platform, at the end of which a magnificent column of flame, 15 ft. or more in hight, rises like the beacon light of Pharos, illuminating

At Night.

The dark forest and the little village—a glorified gas-burner of gigantic proportions, worth a long journey to see. It has a golden-yellow color, with a tinge of purple, caused with scarcely a doubt by the potassium in the fuel. The effect of this almost monochromatic light on the faces of those on the platform and on the dusky foliage is weird and strange. Each face is ghastly and deathlike, while the night landscape is painted in India ink, all color being degraded by the unearthly light.

While looking at the busy workmen feeding the furnace and scanning the mezzo-tinted landscape, the writer noticed a cloud of light-colored objects drawn toward the gigantic candle, which examination showed to be insects, fascinated, as well they might be, by the glorious lamp, and flying in resistless fanaticism to certain destruction. Countless thousands of silly moths, beetles and night insects of many species and kind, rush in a painted cloud to a fiery death, and carpet the floor of the airy scaffold with their scorched bodies.

A large wire is introduced at intervals into the furnace through a small hole in the hell, by means of which the condition and position of the ore is ascertained.

The Balance Elevator,

An invention of Mr. White, is an ingenious device for raising the ore, charcoal, fluxes, etc., to the top of the furnace, where they are fed into the hopper, and gradually, under the effect of their weight and the fire, sink to the outlet, from which the liquid iron issues at the command of the founder.

This elevator is simply two platforms suspended by a wire rope which passes over an iron pulley under the control of a brake. Under each platform or cage is a tank furnished with a valve, which opens mechanically when the platform reaches the bottom. Into the upper one water is let in from a capacious faucet or valve connected with a large tank placed at a slight elevation. When the weight of the water is greater than the load, the upper platform begins to sink, and the load to rise, the velocity of which is controlled by the brake.

The charges are weighed on a platform scale, the charcoal in a large van on wheels, and the limestone and ore jointly in a smaller car. They are raised on the balance elevator to the top, the ore having been first coarsely pulverized and the charcoal sifted. One charge, equal to 30 bushels of charcoal is fed into the furnace every 20 minutes. The charge of iron is regulated by the accidental quality of the charcoal, the average being 800 lbs.

The Floor at the Base of the Furnace

Upon which the casting is made, is about 50 ft. square. It is divided into two equal parts, each side being used alternately—while the cast iron is cooling on one side, molds are being prepared on the other. The whole floor is covered deeply with sand hauled from Bear river; being tailings from quartz mills, it is nearly pure quartz sand. The floor has a slight incline from the furnace. A shallow canal of damp sand is formed down the gentle slope from the furnace outlet. At right angles from the main canal, at intervals of about six ft., there are secondary canals or channels, from which the ingot molds, also of sand, branch off. This arrangement may be likened to a comb, of which the back is the secondary channel, and the teeth the molds, into which the liquid iron finally settles, forming rough ingots or "pigs," the name by which they are generally known.

One side of the floor is covered with these combs, each at a lower level, to admit of the artificial lava stream filling them in succession, by natural gravity. When all is

Ready for a Cast,

The men take their stations, and the founder taps the furnace by cutting out a clay plug with a crowbar. Presently a glowing stream rushes forth and is guided by the workmen into the first set of sand molds. When this is full, an iron gate is so placed as to cut off the stream, which is coaxed into the next set, and so on until the whole casting is disposed of and the lower part of the furnace is empty. The blast is then stopped, and a new clay plug inserted. The blast is then continued and the work goes on as before. While the furnace is being drawn off the whole upper part is filled with charcoal, limestone and iron ore, in an unfinished state. The writer saw a casting made at night, and it was a rare sight. The interior was illumined by the red-hot iron. The workmen moved to and fro in the lurid light, quietly directing the flow of the lava stream into its arenaceous bed. It was a scene of unusual interest, and a striking illustration of the power of mind over matter.

Twenty-five Tons of Metallic Iron,

More or less, are cast every 24 hours. The metal is claimed to be of excellent quality, superior to any imported. The first cast was made April 24, 1881, at 4 o'clock A. M. One pig from this cast has been sent to the State Museum, where it will ever remain, a historical memento of the inauguration of one of the most important mineral interests of California. At the date of the visit of the writer, 450 tons of iron had been produced without accident or serious impediment, 150 tons had been hauled to Clipper Gap and shipped to San Francisco. The average load by wagon to Clipper Gap was two tons, drawn by four horses, assisted at certain points by an extra span. The average weight of a pig is 80 lbs.

There are five grades of iron produced, No. 1 being soft and tough, and No. 5 white hard iron, the intermediate grades being based in the extremes. The quality of the iron depends on the condition of the furnace, which is under control. Each grade is equally valuable, and it is always known before casting what particular quality will be produced. This is known by the color of the slag, and by an unwritten formula, or tuition, on the part of the founders.

The Slag

Is drawn off every three hours and the metal cast seven times each 24 hours. The smelting operation is continuous. When the furnace is once fired up the work is continued day and night for as long a time as possible—sometimes for two years. When the furnace is "blown out," or for any reason the work is discontinued, it is a costly operation which necessitates a partial reconstruction, for which reason it is economy to continue the run as long as possible.

Twenty Charcoal Ovens,

Or kilns, are required to supply this Moloch with fuel. They are built of brick, 28 ft. high, and about the same diameter; six of them are on the banks of Bear river, two miles from the furnace, and the others at a greater distance. Seven thousand acres of land have been secured by the company to insure a sufficiency of wood and charcoal, and to embrace an area of supposed undiscovered deposits of iron. There is stored in a capacious shed 100,000 bushels of charcoal, laid up to guard against deficiency, and all the kilns are kept at work making more. It was noticed by the writer that a vast amount of pyroligneous acid was going to waste, as were other products of the destructive distillation of wood, which it is hoped will be utilized in the near future.

By a fortunate circumstance

A Large Deposit of Limestone

Has been discovered within a few hundred ft. of the furnace, from which an unlimited supply of that essential flux can be obtained, and its value as a flux is not in the least impaired by the fact that it is also a beautiful, white, saccharoidal marble, suited for ornamental and building purposes. A fine block has been placed in the Mining Bureau which will be cut and polished to test its quality. It seems almost a shame to see such marble cast into the fiery furnace martyr-like in its beauty and purity. This marble has been largely sent to San Francisco, to be used in the manufacture of mineral waters. It can be quarried in large blocks if required. Other deposits of iron ore are continually being found, and a system of prospecting is wisely continued, that an unlimited supply of ore may be mined in advance of the demands of the furnace.

A second large deposit of limonite near Clipper Gap, discovered in 1863 by J. R. Brown, remains untouched. When last seen by the writer, it showed a face in an open cut 60 ft. long and 25 ft. high.

Seventy-five men are employed, exclusive of those engaged as charcoal burners, teamsters, wood choppers, limestone and iron miners, etc. The total number of men to whom employment is given is 150 in summer, and 450 in winter.

As the visitor looks forth from the iron battlements and views the surrounding plant and the busy workmen at the base of the tower upon which he stands, or descends to the sandy floor and watches the streams of molten iron flowing obedient to the will of the iron founder, he not only sees the useful metal divorced at last from its ancient compsuion, *oxygen*, but also mentally pictures the future result of the enterprise so successfully inaugurated. The sluggish stream, slowly forming itself into rough pigs, is the precursor of other iron industries yet to be established, such as the manufacture of California steel rails for future railroads, steam engines, rolling mills, iron ships, mining machinery and tools, great guns for the defense of our coast, Bessemer converters and countless articles of iron made in California workshops, giving employment to our own citizens. The ubiquitous hoodlum disappears, and his place is filled by the busy nail-cutter and the industrious mechanic of the future, proud to earn an honest living and bringing up his happy family in comfort, who is not ashamed of his hard hands and grimy face, and who is reckoned among the respected citizens of a prosperous State.

This picture does not require the aid of a vivid imagination, but naturally follows as a matter of course.

The Date Palm in California.

The date palm is one of the oldest of the vegetable immigrants to California. It has taken a much humbler position in the public thought than the orange, the olive and the grape, which were its attendants hither, and yet it has grown into stateliness and attained the dignity of a landmark in several places. The date has lingered in quiet probably because, though its leaves and flowers appeared freely, its fruit is seldom seen. Why fruit has not appeared, whether owing to the isolation of individual trees and consequent lack of fertilization, or whether other conditions have made it barren, has not, we believe, been fully decided. And yet the date palm has fruited in California occasionally.

The palm shown in the picture is smaller than the veterans at San Buenaventura, but it is of the same species, and serves to show the general characteristics of the *Phœnix dactylifera*. During recent years there has been quite a disposition to plant date palms, and some very handsome groves of young trees may be seen in different parts of the State. It remains to be seen whether they shall prove of any value for fruit bearing.

A NEW survey has been made of the county line between Ventura and Los Angeles counties, and some persons who supposed they lived in Ventura find themselves in Los Angeles county, without having moved.

SHEET IRON PIPE.

FRANCIS SMITH & CO.,
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand
SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Arteeian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

PACIFIC MACHINERY DEPOT.
H. P. GREGORY & CO.,
Nos. 2 and 4 California Street, San Francieco.
Importers and Dealers In every description of
MACHINERY!
Sole Agents for the Pacific Coast for

BUCKEYE Engine Company.

J. A. Fay & Co.'s Wood-Working Machinory; Bement & Sons' Machinists' Tools; Blake Steam Pumps; N. Y. Belting and Packing Co.'e Rubber Ooods; Sturtevant Blowers and Exhauet Fan; Tanite Co.'e Emery Wheels and Machinery; Payne's Vertical Engines and Boilers; Perry's Centrifugal Pump; Judson's Standard Governors; Dreyfus Self-Oilers; Gould M'fg Co.'e Hand and Power Pumps; Eclipeo Windmills; Disston & Sons Circular Saws; Otto Silent Gas Engine; Ducs' Elevator Cups; Ballard's Oak Tanned Belting.
Also on hand and for sale A FULL LINE OF MILL AND MINING SUPPLIES.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!
PATENTS REISSUED 1868.
The "OLD RELIABLE" with improvements, making it
THE MOST PERFECT TURBINE NOW IN USE.
Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.
Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address
JAMES LEFFEL & CO., Springfield, Ohio, and 110 Liberty St., N. Y. City.

SHINGLE MACHINES AND SAW MILL MACHINERY, STEAM ENGINES, ETC., TO ORDER. MINING MACHINERY OF ALL KINDS.
F. A. HUNTINGTON,
220 Fremont Street, San Francisco.

DuBOIS' Automatic Quicksilver Feeder.
A machine for feeding quicksilver to the mortars of GOLD MILLS. It is so connected to the cam shaft, that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a mechanical movement, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, supersediog ordinary hand-feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect. Price complete, $100.00. Send for circular.
P. C. DuBOIS,
18 Fremont St., S. F.

OTTOKAR HOFMANN,
(Of the Firm of Hofmann Bros.)
Metallurgist and Mining Engineer.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.]

FOR WEEK ENDING JULY 19TH, 1881.

244,542.—REFRIGERATOR—Bundock & Mapel, Sacramento, Cal.

244,543.—HITCHING CLAMP—J. J. Burke, Walla Walla, Washington Territory.

244,437.—RIVETING MACHINE.—Geo. Cumming, S. F.

244,564.—CONCENTRATING PERCUSSION TABLE.—M. B. Dodge, S. F.

244,389.—BOLTING CHEST—A. P. Gross, S. F.

244,024.—SADDLE GIRTH FASTENING AND HARNESS BUCKLE—Lancaster & Sears, Goldendale, Washington Territory.

244,489.—PILLOW BLOCKS FOR SHAFTS—I. M. Scott, S. F.

244,493.—FRICTION CLUTCH—Budd Smith, S. F.

244,707.—STEAM BOILER—A. M. Wylie, S. F.

244,495.—CAR BRAKE—A. C. Springer, Candelaria, Nev.

244,448.—BALING PRESS.—Jas. N. Grant, Columbus, Nev.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

STEAM BOILER.—A. M. Wylie, S. F. Patented July 19, 1881. No. 244,707. This device consists in a novel construction of a vertical boiler, with means for providing a complete circulation within it, and for exposing water contained within to the action of the heat in the most thorough manner. A tube or pipe extends around inside the ash pit below the grate. This tube is perforated with small holes or nozzles, and receives air from any device which serves to produce a blast through these holes, and thus furnish air for the combustion of the fuel upon the grate above. The amount of air thus furnished is governed by a stop-cock at some convenient point in the supply pipe. From the crown sheet, at the top of the fire box, tubes conduct the heat upward through the water contained in the body of the boiler, and into an open combustion chamber around a lenticular-shaped chamber, which connects with the body by means of a passage, while another cylindrical passage extends to the top of the boiler. From the combustion chamber the heat and products of combustion pass upward around the interior cylindrical chamber and within the outer steam space, escaping at the top. Pipes connect the top of the cylindrical passage with the steam chamber extending down into it, and pipes connect it with the upper part of the body of the boiler. By this construction heat has free access to every portion of the boiler and the pipes conveying the water from one part to another, while, by their construction, a rapid and complete circulation is induced.

CAR BRAKE.—A. C. Springer, Candelaria, Esmeralda county, Nevada. Patented July 19, 1881. No. 244,495. The object of this invention is to provide a means for braking all the cars of a train at the same time by a single operation; this object being accomplished by the application of the device to a common form of brake now in use, which brakes each car independently of the other. The invention consists in a number of extensible connecting rods attached to each car, and operating chains which themselves operate pulleys upon each car and wind up chains which operate the brakes. By this construction the ordinary form of brake attachment is not interfered with, so that either can be applied at will. It can be operated by the engineer or a man in the last car, and, by drawing upon the rods on different sides, both can operate it at once.

RIVETING MACHINE.—Geo. Cumming, S. F. Patented July 19, 1881. No. 244,437. In riveting machines the difficulty has been to regulate the pressure for different work and different sized rivets. The pressure is at present applied directly upon the rivets, and is the same for all kinds of work. Its results are often not satisfactory, for a great pressure applied to a small rivet for thin sheets will press the rivet out of shape and dent end otherwise injure or deface the material to be riveted. This invention has for its chief object the regulating of the pressure applied to the movable jaw, so that by the use of the same power, applied at a different portion of the machine, the power of the movable jaw can be regulated for different work; and it consists in an adjustable steam or hydraulic cylinder, or other power cylinder, so connected with the arm or lever by which the riveting is done that the pressure may be varied and the power accommodated to different kinds of work.

BALING PRESS.—James N. Grant, Columbus, Esmeralda county, Nevada. Patented July 19, 1881. No. 244,448. This invention consists in a peculiar construction and arrangement of conical pulleys whereby the follower is operated with an economy of power; and in a novel construction and means for automatically opening the side doors of the press; and, lastly, in a novel means of securing and opening the top door, and of supporting it in position when opened.

An Improved Step Ladder.

The "United States Champion Ladder," illustrated on this page, and for which a patent has been just granted through the MINING AND SCIENTIFIC PRESS Patent Agency, though simple in construction, excels in strength, utility and portability. It is so constructed that when the two parts—really two distinct ladders—are separated and the pin is in place, it can neither open or shut. The "pin" is the upright stick shown in the engraving, and screwed a double purpose. It is handy as a support when one is upon the ladder. Before the ladder can be folded, this pin must be removed.

The ladder has no useless back, but can be ascended from both sides. In fact, it is two ladders in one, which can be promptly put together to use as one, or taken apart to use as two ladders, as emergency may require.

This ladder is adapted for use by the painter,

"The United States Champion Ladder."

paper-hanger and by mechanics generally, as well as for families, stores, streets or orchards.

W. H. Bray, the patentee, who is manufacturing these ladders at No. 413 Mission street, invites propositions for exclusive rights to manufacture.

The ladder will be exhibited at the Mechanics' fair, which opens next Tuesday, where its merits may be examined.

The Impounding of Debris.

A Report to the Miners' Association of California.

The following official report to the Miners' Association of California, of an examination of the hraah dam on the Yuba river, will be read with interest, coming, as it does, from competent engineers who have thoroughly examined it:

To the Miners' Association of California—GENTLEMEN: I have, at your request, made a professional examination of the dam built by the Commissioners of Drainage District No. 1, across the Yuba river in 1880, and now beg leave to submit the following:

By the courtesy of the State Engineer, I have been furnished with copies of the cross-sections taken at various points above and below the dam and across the Yuba river. These sections were taken in 1880 just before the construction of the dam; were retraced during the present month, and show in detail, with sufficient accuracy, the present condition of the dam and the amount of material which has been lodged immediately above it since it was built.

The dam is a structure of brush laid parallel with the stream, with bending poles laid at right angles and tied together with wire. A brush mattress is placed below the downstream slope of the dam to prevent it from undercutting as the water passes over; the upper slope was protected by tiers of sand-bags. The largest trees used have a diameter of about eight inches. Earth embankments connected the ends of the brush-work with the shore-lines.

The total length of the dam is nearly 10,000 ft.; its greatest hight, 14 ft.; its cost was in the neighborhood of $120,000.

The dam has broken in three pieces, as follows: The earth embankment at the northern end has been washed away nearly down to the original level from the end of the brush-work to the shore, a distance of 400 ft.; the brush dam has been cut away entirely in two places—one 760 and the other 230 ft. in length, measured on the crest; in two places there are small gaps, but with the foundation undisturbed. Out of a total length of 10,000 ft. there has, therefore, been destroyed about one-seventh.

The crest of the dam has settled an average of slightly less than 2 ft.; this apparent settlement is nearly in proportion to the original hight of the structure; that is to say, it is generally greatest where the dam was highest, and has, without doubt, been nearly altogether caused by the compression of the loose brush into a solid mass by the pressure of the water which has passed over the crest. Along the whole length of the dam there are evidences of the large stream which flowed over it; heavy water-soaked logs, of 2 ft. or more in diameter, are still resting on its crest, and the protection mattress, where not covered with sand, shows signs of the rush of the water.

In many places, both on the dam and on the protection mattress, willows are now sprouting and growing; their roots will have a very beneficial influence in matting or tying the whole structure securely together.

It is a notable fact that none of the breaks occurred at the old river channels. The southern break—230 ft. in length—was over an old slough. The bottom at the other breaks was not thought to be comparatively soft or infirm.

The brush mattress below the dam has very satisfactorily answered its purpose in protecting the lower slope of the work from under-cutting.

Causes of the Breaks.

The earth embankment which gave way was in all probability first attacked by water passing with considerable pressure through the interstices of the brush work, and washing away the earth immediately next to the brush bulkhead. After the water had once commenced cutting, as a matter of course the whole embankment soon crumbled away. This supposition is confirmed by the statements of eye-witnesses, and by a knowledge of the injudicious manner in which the earth and brush works were connected.

The breaks in the dam proper were probably caused by strong currents of water sweeping along and undermining the upper or inner slope of the dam, the water escaping through the depressions caused by the compression before alluded to. Small brush buttresses, projecting at right angles up from the dam, would have greatly lessened the danger from any such undermining.

The flood of the past winter, which at its maximum is thought to be greater than the memorable flood of 1861-2, came upon the dam, soon after its completion, with great force. Had there been only the ordinary spring freshet, thus allowing the brush to be gradually filled and compacted with sediment, there would have been much less subsequent compression, and, very likely, the whole work would have stood in its entirety.

The dam was commenced at a late period in the season, and from the necessary haste in which it was built, it was doubtless impossible to devote that care in its construction which would have been taken had there been more time in which to do the work.

Benefits Resulting Already from the Dam.

The sections before referred to, taken across the river, show that:

Feet.						Feet.
50	below dam there has been an			average	erosion of	8-10
50	above	"	"	"	fill of	55-100
¼	mile	"	"	"	"	1 8-10
1	"	"	"	"	"	1 3-10
1½	"	"	"	"	"	1 8-10
2	"	"	"	"	"	4-10
2½	"	"	"	"	"	3-10

Still higher up the river just below Smartsville, the bed is now much lower than in 1880.

The total fill since 1880, for a distance of 3½ miles above the dam, is estimated at 4,851,000 cubic yards.

To my mind the foregoing facts show conclusively that this filling or restraint of nearly 5,000,000 yards has been caused entirely by the presence of the dam, or, in other words, that had not the dam been built, all this material would have been washed still farther down the stream, the larger portion lodging on the slackened grade near Marysville, the residue passing into the Feather river.

The serious breaks in the dam did not occur until the flood had, in a measure, spent its force, so that at the moment when Marysville was in greatest danger of inundation, a notable quantity of water was held back, together with a flow of sand, which would otherwise have materially increased the level of high water.

Judging from the accounts given me of the flood, it seems clear that to this dam Marysville is indebted for its safety during the past winter.

Cost and Advisibility of Repairing the Dam.

The tests to which the work now stands have been subjected are so severe, and the results on the whole so satisfactory in an engineering point of view, that I am convinced that the dam can and should be securely repaired. The breaks should be filled with brush work, similar in general character, but more carefully executed, to the old structure; the dam should be, when settled or compressed, raised to a little above the original hight. When thus repaired, in my judgment, the work will stand the floods, and fully answer the purpose for which it was designed.

A contract can, I think, be made with responsible parties for a sum not over $50,000 who will agree to put the dam in good repair, and only receive their pay in case it stands intact until the summer of 1882. Without such a guaranty, the repairs can be executed for a much less sum.

The estimated storage capacity of the reservoir to be formed by this dam is 41,500,000 of cubic yards; deducting the 5,000,000 of yards now in place, there remains 36,500,000 yards of storage capacity, which can be secured for the comparatively small sum of $50,000 or less.

The State Engineer estimates that the annual flow of material, which can be impounded, down the Yuba river averages about 16,000,000 yards, all the mines being at work. This Yuba dam will therefore, when restored, hold over two years' supply. It is probable that the flow of sand down the Yuba for several years to come will be below the average, as the great flood of the past winter has swept down very much more than the usual quantity.

It has been objected to this dam, that in case of a break, the impounded sands would pour out in a great flood on the lower lands. Were it a reservoir of water, such would be the case, but with a filling of comparatively compact material, any break would only result in the discharge of the sand cut out by the narrow current of water passing through the breach. The large amount of debris held back by the dam, in its present badly broken and incomplete state, is sufficient proof that this objection is practically an unsound one.

Conclusion.

Should this dam be restored, and hold back from the Yuba and Feather rivers the injurious flow of sand and gravel—all of which I believe it will do—the bitter contest now pending between miners and farmers can be brought to an end, before the strife has inflicted irreparable injury on either or both parties.

There is no question but what there is ample room in the Yuba canyons in which to store the mining debris for very many years to come. The magnitude of the mining interest is so great that if it once be shown that the debris can be stored with safety at a reasonable expense, then certainly ways and means will be found for the execution of the necessary engineering works.

Hence, I especially hope that the mining community will do all in its power to have this dam across the Yuba thoroughly repaired, so that its value may be determined with certainty.

It may be well to add that, even supposing mining to be discontinued, still the dam will be of great service in holding back the large deposits of sand and gravel already placed above it in the beds of the river and its branches.

Col. Geo. W. Mendell, of the United States Engineers, has been kind enough to give me the letter which is attached to this report. The views of Col. Mendell will doubtless receive the attention which his high standing in the profession warrants.

Very respectfully, HAMILTON SMITH, JR.
San Francisco, July 27, 1881.

U. S. ENGINEER OFFICE, No. 533 Kearny St. }
San Francisco, Cal., July 27, 1881. }

Hamilton Smith, Jr., San Francisco.—DEAR SIR: I give, at your request, after an examination of the brush dam in the Yuba, my opinion as to its condition and usefulness, past and prospective.

The portion of the dam which is standing, seems to me to be firmly established, and not liable to destruction from the river.

The fact that breaches were made in the dam during the past winter does not impair my confidence in the stability of this kind of construction, and I believe that the breaches can be restored at a moderate cost.

The dam in its present broken condition has arrested considerable detritus, and if restored to its original integrity and hight, must, in my judgment, be efficacious in impounding a large quantity, which, if not thus arrested, cannot fail to do great injury below. I am, very respectfully, your obedient servant,

G. W. MENDELL.

LOWEST DEPTHS.—Following is the lowest depth, in feet, that has been attained at the principal mines on the Comstock:

Utah, bottom of incline, run south from vertical shaft	2250
Sierra Nevada, bottom of joint Union Con. winze	2700
Union Con., bottom of joint Sierra Nevada winze	2700
Mexican, bottom of joint Ophir winze	2860
Ophir, bottom of joint Mexican winze	2360
California and Con. Virginia, each	2500
Best & Belcher, bottom of joint Con. Virginia winze	2300
Gould & Curry, Osbiston shaft	1980
Savage, Hale & Norcross, Chollar and Potosi, each	2400
Julia	2900
Bullion	2800
Imperial Con	2800
Yellow Jacket	3000
Crown Point	2760
Belcher	3090
Overman	2275
Alta	2065
Foreman shaft	1980

PREVENTION OF LEAD POISONING.—People who are engaged in smelting or in dry crushing will be interested in looking at the engraving of the "Life-saving Respirator," which we give in another column. This is a preventive of lead poisoning and guarantee against salivation. It is specially adapted for lead corroding, lead smelting, lead mines, amalgamating and retorting, bullion refineries, quicksilver mines, etc. The instrument is quite simple, and is to be worn over the mouth, nose and chin, for protecting the throat and lungs from dust, obnoxious smells, or poisonous vapors. The air is inhaled through a wet sponge, or cotton, and in expiring, passes out through a valve at the side.

HIGH GRADE.—Another batch of between six and seven tons of Montana ore, shipped to the Bay Horse smelter, gave a return of $2,017 per ton. The Yankee Fork *Herald* complacently asks how that is for high grade ore? That is good for Idaho, but how is this for California? The Ford, McDonald and Muller claim, Nevada county, last week got $22,000 out of 1,579 lbs. of quartz—nearly $14 to the lb. Then 41 loads of rock more yielded $80 a load.

WYOMING MINES.—A dispatch from Cheyenne, (Wyoming Ter.) says: The discovery of copper and silver-bearing ore near Fort Laramie, is creating immense excitement. Miners are stampeding to the new district, which is about six miles wide, and is already swarming with prospectors, all of whom are making locations. The surface assays vary from $60 to $150 per ton. Smelters will be erected at once, as the ore assays from the grass roots.

News in Brief.

SAN BENITO property is assessed this year at $4,128,741.

INYO county assessments this year foot up $1,057,395.

COAL has been discovered about eight miles up the Palouse, W. T.

A CHOTEAU (Montana) merchant has shipped over $100,000 in furs this season.

SOME farmers in Kern county are overrun by the rabbits. One man shot 300 in a week.

AN investigation into the management of the U. S. Branch Mint of this city is in progress.

THE enterprising town of Redding, at terminus of Northern Pacific railroad, has a $10,000 school-house.

THE total assessed value of property in San Diego county this year, after making all deductions, is nearly $7,000,000.

THE foreign Ambassadors refuse the Porte's request to delay the cession of the zone of the ceded territory to Greece.

GRADING on the Eureka and Colorado railroad is to be commenced at once. There is a large force of engineers in the field.

THERE are now more men at work in the mines of the Gold Hill section of the Comstock than at any other time for the past three years.

THE Napa Board of Equalization has denied the application of the railroad company for a reduction of its assessment in that county.

IT is estimated that as much as 1,000 tons of freight intended for Montana, will lay over at Bismarck this winter for want of transportation facilities.

A SURVEY is being made for the route of the proposed narrow gauge railroad from Silver King to the railroad. At last accounts they were at Florence.

THE news from Tunis and Algeria is very conflicting. Some reports represent that quiet is returning, and others speak of new outbreaks, actual or intended.

IN spite of the comments of the Italian ministerial press, there are persistent rumors, in well-informed circles, of an understanding between England and Italy.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none out worthy men.

J. F. OSBORNE—San Francisco.
G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED O. HOAG—California.
B. W. CROWELL—Yuba and Sutter counties.
D. W. KELLEHER—Napa, Nevada and Placer counties.
GEO. H. HOPKINS—Amador county.
A. LEONARD MEYER—Utah and Idaho Ter.
C. E. WETMORE—Alameda county.
J. M. WOLFE—California.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F.D., at this office.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We will send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus, terms of subscription, etc., and request that they circulate the copy sent.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

THE State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half year ending this date, the Board of Directors of The German Savings and Loan Society has declared a dividend on Term Deposits at the rate of five and one-tenth (5 1-10) per cent per annum, and on ordinary Deposits at the rate of four and one-fourth (4¼) per cent. per annum, free from Federal Taxes, and payable on and after the 11th day July, 1881. By order, GEO. LETTE, Secretary.
San Francisco, June 30, 1881.

Middleton & Son, No. 116 Montgomery street, San Francisco, California, on Thursday, the 18th day of August, 1881, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. W. PEW, Secretary.
Office, 310 Pine street, room 15, San Francisco, Cal.

BUY LAND

Where you can get a crop every year; where you will make something every season; where you are sure of having a crop when prices are high; where you have a healthy place to live; where you can raise semi-tropical as well as other fruits; where you can raise a diversity of grain and vegetables and get a good price for them. Go and see the old Reading Grant (in the upper Sacramento Valley), and you will find such land for sale in sub-divisions to suit purchasers—at reasonable rates and on easy terms. Send stamp for map and circular to EDWARD FRISBIE, proprietor, (on the Grant), Anderson, Shasta Co., Cal.

WE ARE SOLE AGENTS FOR THE GENUINE
ALBANY COMPOUND, CYLINDER AND SPINDLE OILS.
All others are Counterfeit.

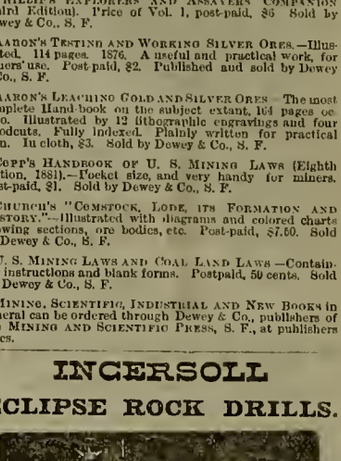
INGERSOLL
ECLIPSE ROCK DRILLS.



The Most Economical Air Compressore in the Market.

MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

REYNOLDS & RIX,
49 Fremont St., S. F.

HIGHLAND SPRINGS,
LAKE COUNTY, CAL.

BEAUTIFUL AND HEALTHFUL SUMMER RESORT FOR FAMILIES, INVALIDS, CAMPERS AND PLEASURE SEEKERS.

Hotel and Cottages Newly Furnished.

Board and Room, $10 per week, including Mineral Baths. Children under six years, and Servants, Half Rates.

Direct route by steamer "Donahue" to Donahue Landing, connecting with S. F. & N. P. R. R. to Cloverdale, thence by stage to Highland Springs.

The springs are situated at an altitude of 1,700 feet above sea level; and for natural beauty of scenery, healthful climate, hunting and fishing, are unsurpassed in the State. The surrounding forests and valley are particularly inviting to campers, who will be especially entertained at the Springs.

The waters have produced many wonderful cures in the following diseases: Dyspepsia, Paralysis, Erysipelas, Rheumatism, Sciatica, Liver and Kidney, Bronchitis, Pulmonary Complaints, in their early stages, General Debility, and a never-failing remedy for Chills and Fever.

SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

CALIFORNIA
Electric Light Company.
Owners of the Brush System of Electric Lighting for the Pacific Coast.
Apparatus for sale for Mines, Mills, Manufactories, etc.
Plating Machines and Machines for treating Ore manufactured to order.
Electric Light furnished on all the principal streets of the city.
Office—No. 119 O'Farrell Street,
SAN FRANCISCO, CAL.

QUICKSILVER.
THE CELEBRATED A BRAND, SHIPPED
DIRECT FROM THE
NEW ALMADEN MINE,
For sale in any quantity by the producers. Car Load Lots will be shipped from San Jose for Nevada, Arizona and the East, or delivered at Pacific Mail Steamship Company's Wharf, San Francisco, without charge.
THE QUICKSILVER MINING COMPANY,
J. B. RANDOL, Manager,
No. 320 Sansome Street.
Over Wells, Fargo & Co.'s Express Office.

San Francisco Pioneer Screen Works
J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.
32 Fremont Street, San Francieco.

To Consumers of High Explosives.
The statements so industriously circulated by the Nitro-Glycerine Powder Companies that the explosion a Tucson was caused by Tonite, are untrue in every particular, and we challenge all of them to furnish any proofs to the contrary.
TONITE POWDER CO.,
218 California St.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorable rates.

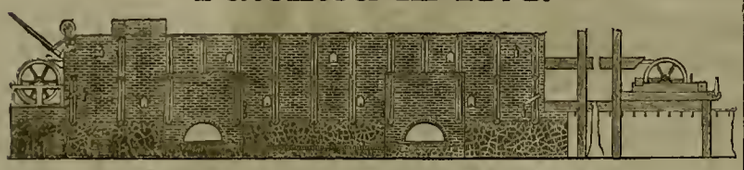
REVOLVING CYLINDERS AND ORE DRYERS.
Hoisting and Pumping Machinery.

THE O'HARRA
CHLORIDIZING FURNACE.
Patented in 1878.



SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

—o—

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ores to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1 10 per ton to work 40 tons in 24 hours.

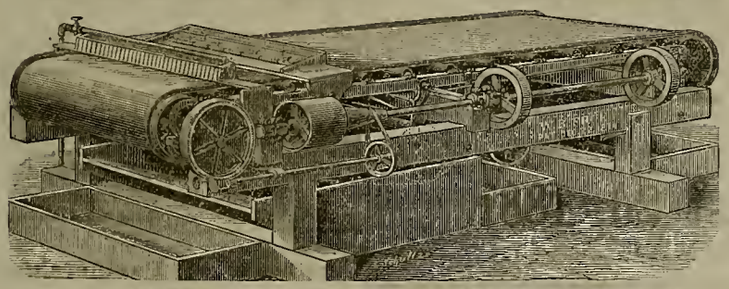
At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61¼.

Lewis Chalmers, of the Isabella G. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenical sulphurate of silver up to from 84% to 95% of the assay.

SEND FOR DESCRIPTIVE CIRCULAR TO

WHITNEY, VEASEY & CO.,
Carson City, Nevada.
Agents for San Francisco, KUSTEL & CO., 318 Pine Street.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Over 250 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

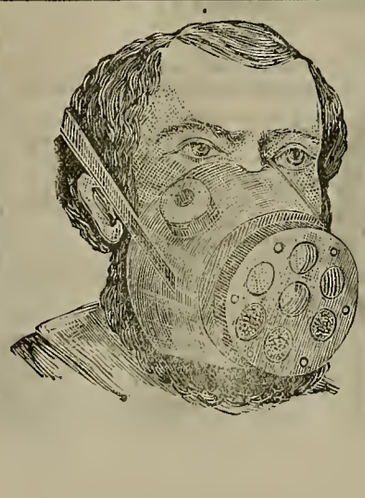
Saves from 50 to 100 per cent. more than any other Concentrator in use, and the concentrations are clean from the first working.

The wear and tear are merely nominal; the water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

ADAMS & CARTER, Agents, Room 7, No. 109 California Street, S. F.

PATENT
LIFE-SAVING RESPIRATOR
Prevents Lead Poisoning and Salivation.



INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

Excelsior Blasting Powder,
—MANUFACTURED BY—
THE EXCELSIOR POWDER COMPANY.

—o—

This is no NEW PATENT NON-EXPLOSIVE SAFETY POWDER, but the GENUINE STANDARD ARTICLE, and as safe to use and handle as any Nitro-Glycerine Powder manufactured. The Fumes and Gases, common in other Nitro-Glycerine Powders, are almost destroyed, and do not leave the miner with headache or nausea. Among the numerous recent testimonials the following is but a fair sample, constantly received, attesting the superiority of EXCELSIOR POWDER:

AUBURN, Cal., May 26, 1881.—EXCELSIOR POWDER CO.: I send you, per Wells, Fargo & Co., a box containing samples of country rock through which I am running our tunnel on the Conrad Mine, and through which we have now run 425 feet, 225 feet of it having been done with EXCELSIOR POWDER. If any one can produce harder rock I would like to see it. I here say that I can do more execution with your No. 2 Powder in this rock than I can with any No. 1 Powder of any manufacture I have ever used, and I have used every kind now manufactured here, excepting "Tonite," and I have had 20 years' experience in blasting. Respectfully yours,

E. W. ROBERTS, Superintendent.

Give this Powder a trial and you will use no other. For Strength and freedom from noxious fumes, it has no equal. Address all orders to EXCELSIOR POWDER CO., No. 330 Pine Street, Rooms 53 and 54, Academy Building, San Francisco, Cal.

A FIRST-CLASS LODGING HOUSE
CONTAINS 113 ROOMS.
715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts., per week, from $2.50 upwards

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

Certificate of Partnership.

We certify that we constitute a partnership transacting the Printing and Publishing Business, in the city and county of San Francisco, State of California, under the name and style of George Spaulding & Co. That the names in full of all the members of such partnership and their respective places of residence, are as follows: George Spaulding of San Francisco, Dwight Germain of San Francisco.

In witness whereof we have hereunto set our hands this First Day of April, A. D. 1881.

GEORGE SPAULDING,
DWIGHT GERMAIN.

Duly acknowledged, June, 4th, A. D. 1881, before Sam'l S. Murfey, Notary Public.

Endorsed—Filed May 3, 1881.
WILLIAM A. STUART, County Clerk.
By JOHN H. MOTT, Deputy Clerk.

Certificate of Partnership.

We certify that we constitute a partnership transacting business as manufacturers and dealers in patent water closets and other sanitary goods, in the State of California. Its principal place of business is San Francisco, California; its name is Milne & Gants; the full names and respective places of residence of all its members are signed hereto.

Dated, San Francisco, July 9th, 1881.

GEO. MILNE, residing at San Francisco Cal.
WM. H. GANTS, residing at Oakland, Alameda County, California.

Duly acknowledged, July 9th, 1881, before W. H. Barton, Notary Public, in and for the City and County of San Francisco, and filed in the County Clerk's office of the City and County of San Francisco, July 9th, 1881. Endorsed: Filed July 9th, 1881. WILLIAM A. STUART, Clerk,
By JOHN H. MOTT, Deputy Clerk.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, AUGUST 6, 1881.

VOLUME XLIII Number 6.

Upper Wood River and Saw Tooth Mines.

(From our Special Traveling Correspondent.)

The mines I have already mentioned in previous letters from this section, are all situated in the Lower Wood River, or Mineral Hill district. Adjoining this on the north is the Warm Springs district, bounded south by Deer creek, and extending up to Bowlder creek. It comprises Greenhorn gulch, Porphyry and Warm Springs creeks, which lie to the west of the river, and East Fork, Bowlder Lake, Trail and Willow creeks to the east. In Greenhorn gulch are a number of important locations, principal among which are the Imporial, Oriental, Greenhorn, Perry and Maud May. The formation is generally granite on one side and slate on the other, with numerous large upheavals of lava on both sides of the gulch. The ores are all galena or carbonates, carrying from 75 to 200 ozs. silver, with an average of nearly 70% lead.

On Warm Springs creek are about 100 locations. The Kelley group, about four miles from Ketchum, comprises five mines which have recently been sold to some Eastern parties for $20,000. They are the West Fork, West Fork No. 2, Yellow Jacket, Black Hawk and Big Beaver.

The next is the Moffitt & Ervin group, on Boyle mountains, comprising some 18 locations, in a formation of talcose slate and lime which is crossed by wide porphyry dykes. On this group two incorporated companies are now operating. The principal developments are on the Ontario, Niagara, North Star and Sunday. The North Star has a tunnel on the ledge which shows all the way from 1 to 22 ft. of ore. One sample taken at a point 48 ft. from the mouth of the tunnel, where there is a crosscut, gave 37 ozs. of silver and $4 gold to the ton. At this place a shaft has been sunk to a depth of 38 ft., with from one to three ft. of good ore against the foot wall. This is a contact vein with a porphyry foot wall and a dolomite limestone on the changing wall. The company are now sinking on the ledge 200 ft. from the mouth of the tunnel and 110 ft. from the surface, where the ore is chloride and carries but very little lead. The vein matter looks as if it was turning into milling ore. They have about 300 tons on the dump, which has all been obtained in running the tunnel and without any stoping whatsoever.

The Ontario is opened in two places about 200 ft. apart, and shows a solid streak of galena from 10 to 30 inches wide. A carload of this ore sampled 142 ozs. silver and 56% lead. The vein is in porphyry formation, running from northeast to southwest, or nearly so, and is decidedly the best looking claim on Warm Springs creek, for the amount of work done.

Four samples taken from different places on the surface of the Sunday, assayed from 31 to 317 ozs., with 65% lead. At one point, an incline shaft has been sunk for 46 ft., showing a 20-inch vein of galena at the bottom.

There are now 12 men at work on these claims, and the force will be increased as soon as the work will justify such a course. They belong to a Boston company, who intend to develop them and some other locations as fast as possible. There is an abundance of good timber and a number of fine springs on the side of the Boyle mountain, in close proximity to the mines.

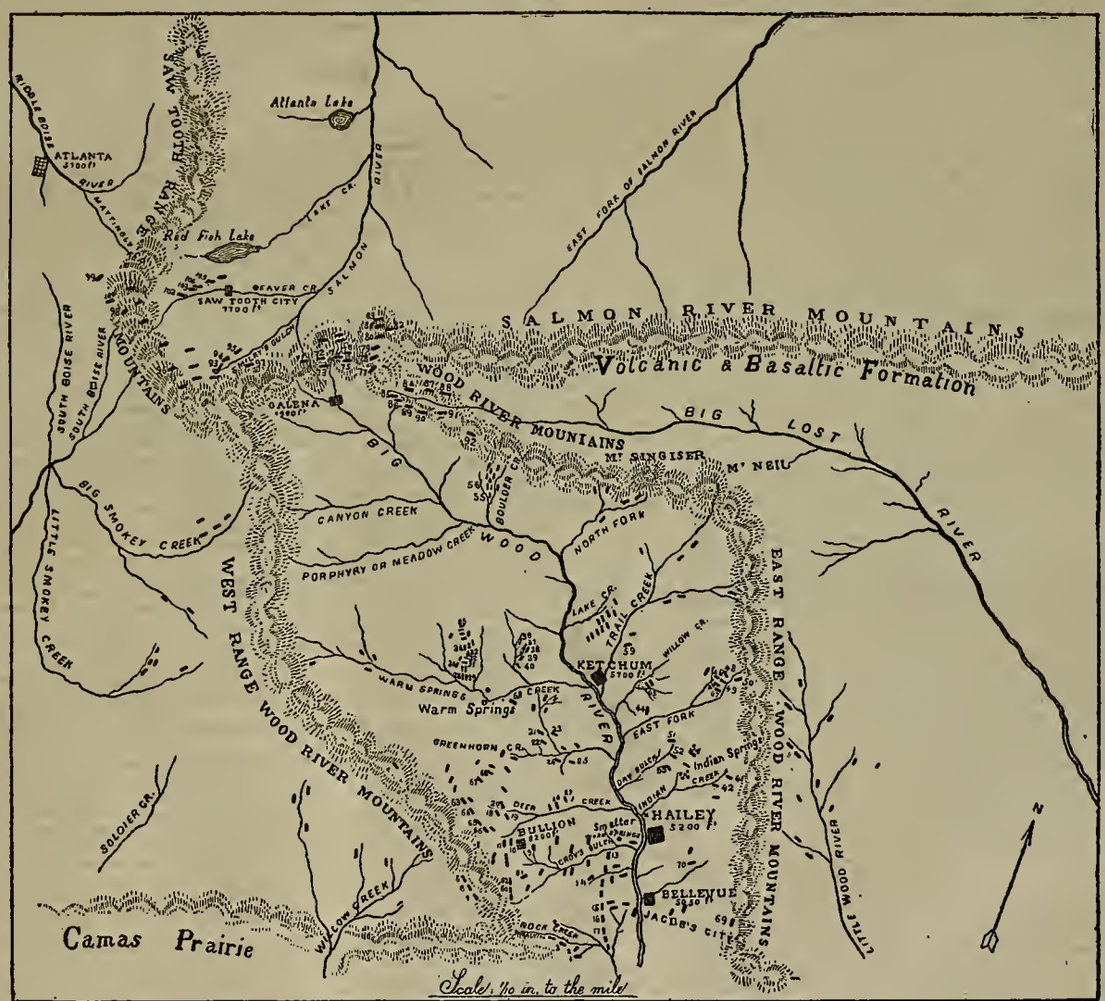
The Black Horse is also owned by a Boston company, and is looking well. It is on the same vein as the Ontario, and is now being opened up. There are a number of other good prospects on Boyle mountain, but they are lying idle, bonded, I believe, to some Eastern parties. There are two parallel veins, located for 9,000 ft., one running through porphyry and the other between porphyry and lime.

On Lake creek are about ten locations, and five miles north of Ketchum, on Bowlder creek and North Fork, are numerous fine prospects, operated by a company from Stockton, Cal., under the superintendency of Dr. Cross.

On Trail creek, which empties into the Wood River close to the town of Ketchum, there are many good locations, but no important developments have been made. The Mountain Lily, owned by Judge Lewis, has produced copper silver glance of a vitreous, metallic luster, assaying as high as 900 ozs. to the ton.

The Elk Horn mine, four miles southeast of Ketchum, was discovered last summer by John Rasmussin, and sold to Judge Lewis for $12,000. It is one of the best mines in this district, and is producing some splendid ores. About 140 tons were shipped from it last year to Salt Lake smelters.

On the east fork of Wood River are the North Star, American Eagle, Silver Fortune, Champion, Boss, Paymaster, Summit, Silver King, etc. The North Star was discovered by William Jaikovski, and is the most promising mine in this section. Large quantities of high-grade ore have been shipped from it, and it now has 200 tons on the dump and probably $25,000 in sight. This property will change hands in a few days.



MINING MAP OF BIG WOOD RIVER—DRAWN FOR THE MINING AND SCIENTIFIC PRESS.

In this district are also the Star Mountain group of mines, consisting of the Ohio, Lulu, Hawkeye, Commodore, Bellevue, Star Mountain, Garfield, Amazon, Empire and Hancock. Some of them are already sufficiently developed to show true fissure veins about two ft. wide, carrying both milling and smelting ore, worth on an average, 120 ozs. The group is owned by the Star Mountain Mining Co., of which Judge Lewis is superintendent, and held to be worth $60,000.

North of Deer creek are the Narrow Gauge, N. G., No. 2, Banner, Kit Carson, Saturday Night and Monumental. The first named has recently been sold to some capitalists, for a round sum.

At the head of Warm Springs creek are the Little Smoky mines, prominent among which are Climax, Carrie Leonard, and several more, assaying from 100 to 3,000 ozs. smelting ore.

Adjoining the Warm Springs district on the north is the Upper Wood River or Galena district, in which some very excellent locations have been made during the last two years. The formation here is also slate and lime, with some porphyry, and the ores will average from 175 to 200 ounces per ton.

The principal locations lie to the north and northeast of Galena city, within a few miles of that town, and are named as follows: Shamrock, Signal, Western Home, Adelaide, White Cloud, Gladiator, Accident, Little Chief, Big Chief, Eunice, Wood River, J. Marion Sims, Baltimore, Dinero, Grand View, Lawrence, Senate, Red Cloud, Independence, Wellington, Leviathan, Highland Chief, Monarch, Our Girl, Clara, Garfield and Serpent; the three last named being incorporated by the Clara Consolidated mining company. Besides these there are some 200 other more or less promising prospects in this district. They are all situated at a very high altitude, ranging from 8,500 to 10,000 ft. above the sea level. As yet no important developments have been made on any of them, but the parties owning the mines are diligently at work opening them up, and with the appearence of the first smelter a new impetus will be given to mining operations on Upper Wood River. The country is heavily timbered and is easy of access, via. Bellevue, Hailey and Ketchum.

On the other side of the high ridge which divides the waters of Wood and Salmon rivers lies Saw Tooth district. The general formation there is granite, and the ores unlike those on Wood River are milling. They are of a high grade, but sufficiently refractory to require roasting. The Pilgrim, Vienna, Columbia, Smiley's, Beaver, Beaver Extension, Lucky Boy, Scotia, Atlanta, Nellie, Sunbeam and Napias are the most noted and best developed mines in this district. The Pilgrim has a shaft 91 ft. in depth, at the bottom of which is a four-foot ore body, paying 100 to 150 ounces per ton. During last winter a tunnel has been run to connect with this shaft, and it has already progressed some 434 ft. The last 30 ft. of this tunnel is on the hanging wall, and shows good ore all the way. A crosscut has just been run to strike the foot-wall, and the result is that a splendid chimney of solid ruby ore has been laid bare. The announcement of this strike has already spread far and wide, and proves that surface indications are nothing to what may be found by going down. The Vienna Co. have run three tunnels on their ledge about 100 ft. apart, one above the other, and are taking and shipping ore running from 250 to 500 ounces. The ledge is four ft. wide, but only about 18 inches of it goes as high as that.

The Columbia, which has considerable rich ore in sight, is not much developed. The other locations enumerated are but partly opened up.

(CONTINUED ON PAGE 89).

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Monument District, New Mexico.

EDITORS PRESS:—This district of Monument is so-called for the reason that its south line is marked by the Monuments dividing New Mexico from the State of Chihuahua. It is about 20 miles from Eureka and 15 from the Carozillio springs, each in New Mexico, and 25 miles south of the Southern Pacific railroad, and about 60 miles from Ianos and Ascension, the nearest Mexican settlements. It was discovered by Volney Rector, of Santa Rosa, Cal., last November, he locating the United States Treasury and the Sub-Treasury mines at that time, in connection with his brother of Oakland, P. Sussman of San Francisco and I. Block, of Alameda. That vein is eix ft. in width, a true fissure, and shows metal its whole length. Assays can he had way up into the thonsands of dollars, hut the generel average of the vein would not be less than 50 ozs. in silver to the ton and probably much more, with 20% galena. Mr. Rector has sunk 5 shafte from 15 to 30 ft. in depth, each of which showing an increase of metal es sunk npon. The Sub-Treasury proves to be in Chihuahua, as is also its extension, owned by Clark Gray and S. M. Wyman, of Chicago, and James T. Cruishank, of Antioch, Cal., all of which have been locatod under the mining lawe of Mexico. Many other mines of great prospective value have been located in the district, both in old and New Mexico. Bnt the district'e greatest difficulty at present is the want of water. The nearest and in great abundaoce is at the Cerozillio, from whence it could he taken to the district by gravitation, firet having to be forced from the epring tc the top of a hill about 200 ft. in hight. Water may, however, be found in sufficient quantity when depth is reached in the mines.

The rock of the country is lime, slate, porphyry and sandstone. The vein matter is black manganese, oxide of iron, feldspar and quartz, although rich deposits have been found in the sandstonc. No oue should come here to prospect without means to supply themselves with water and supplies, as there is no chance at present to obtain work from those who have claims, they having their force employed.

Monument, July 20, 1881. VERITAS.

Theory About the Formation of Universes and the Causes of Planetary Motions.

Written for the PRESS by J. VITAL DE VRY.

Preamble.

Matter and the spirit that governs it are infinite and eternal.

The infinite and eternal epirit or mind, active, is to the eternal infinite matter, passive, like man's mind, like man's soul, forever identical and perfectible, ie to his ever limited and transmutable body.

Attraction, as first agent of tbe Deity, is

Every so-called fixed star, ervey star that glitters by its own eplendor, whether visible or invisible to coeval with matter; and space, the abode of tbe Diety, is without boundaries.

the inhabitants of earth, is the sun and the center of gravity of a solar system or universe, as one may please to call it. A eolar system or universe is a mere spot in the boundless space. The number of univerees is infinite. The sun of each universe is surrounded by a retinue of worlds of diverse ages and eizes, and in different conditions, which revolve around that central globe.

Etherial air fills all space not occupied by more condensete matter. Each universe has its beginning, its youth, its full growth, its decay and its dissolution, and so is it with each of its members.

Formation.

At first, the matter that is to enter into the formation of the globular bodies of a universe, is cool, in a nebuloue state, diffused in the spherical regiou the future universe is to occupy.

When matter begine to take form, atoms, seeking atoms to the extent of their power of attraction, attract one another, and form molecules. Moleculee are likewise agglomerated, and form groups of globules. The globules resulting from these incipient agglomeratione obey the same lawe, and form innumerable globee of a comparatively small eize.

Through similar agglomerations, alwaye caueed and regulated hy the laws of attractiou, larger globes, each composed of a great numher of these primitive globes, are formed. Iu like manner, agglomeratione follow agglomerations, and the globular bodiee decrease in number as they grow in eize, till solar heat, as a eecond agent, is brought in the field to counteract attraction, and put a stop to further conglobation.

While attraction causes these innumerable conglobatione, the universal centripetal force drawe all molecules, globules and globes, irregularly dispersed and wavering throughout the universal epace, toward one common center, with great energy at the very center, and well nigh imperceptibly at the boundariee of the embryonic universe. Hence, at the center, conglomeration goes on with greater rapidity than in the ambient and more remote regions.

At thie universal center of gravity a great mass of plastic matter conglobes, forms a gigantic spherical body, which is soon to be the snn of the new universe. The heaviest particles of matter composing this globular body descend toward the center, and the lighter, the liquid, the oleagenoue and the phosphorescent matter is driven toward the surface.

The emaller globes snrrounding this hnge central globe are powerfully attracted by it, and finally fall into it; and thus, to the extent of their hulks, add to the atomic conetitntion of the growing solar body, which, being drawn toward all points in a sphere's surface, cannot but remain in the center.

Each globe, in its fall, acquires a momentum proportional to its gravity and the space it falls through.

The globes formed at a distance of two or three billions of miles from the univereal center of gravity, as they approach that center, move with the greatest possible velocity toward it; and, finally, in falling into it, strike that body with such violence, that the whole globular mass of matter, etill plastic, is set in a rapidly quivering etate, which causes excessive friction, and friction causes ignition. The colosal central globe, before plastic, tepid and opaque, is now a ball of fire—a sphere shining by its own eplendor, shedding heat and light throughont the nniversal space. It is now the infant eun for the embryonic universe.

Many globes, formed at pointe more distant from the univereal center of gravity, have, in their fall, through the agencies hereafter explained, started their axial and orbital motione; but too late; they have fallen too low; they have come too near the sun; the centripetal power, resulting from thie proximity, cannot be counterbalanced by any centrifugal force the primordial rotatory and volute-like motions of these globes may generate, however rapid these motions may be.

These globes fly, for a short epoch, around the infant sun; not in a circular or elliptical orbit, but in a volute like way, from circumference to centre; and each one ends ite individuality as globe by being absorbed by that central luminary body. Eech globe, at the end of its volute-like flight, as it comes in collision with the sun, strikes that body in a circular—in a tangential—direction, and acts upon it like the driver in a gear acts upon the driven—gives it an impetus that cansee rotary motion. The solar globe, having received similar shocks from all sides, is forced to move in a direction fixed by a combination of the forces these collisions have generated. The rotary motion of the snn generates an annular, ethereal current.

Diurnal or Axial Motion.

The globes formed near the outskirte of the universal space, say at distances of five or six trillions of miles from the solar globe, are likewise heated in proportiou to the concussions they received through a series of conglobations during the process of their formations. They, too, are attracted by, and, slowly at first, but with a gradnally increasing velocity, move—fell rather—toward the colossal central globe; and, like all falling bodies, have their heavier hemiepheres turned toward that universal center of gravity. They gradnally cool as they move through the cold, ethereal air.

Each of these planetery globes, formed at euch enormous distances, arrivee at a point, in its long downward journey, eo near the solar globe that the heat of that luminary body evaporates a part of the water contained in the youug planet'e illumined hemisphere. This hemisphere, till now the heavier, loses a weight equal to that of the moisture extracted from it hy evaporetion, hecomes the lighter; and the other, the upper hemiephere, the heavier; and thus, forced to comply with the demande of attraction, the plenetary globe must, partly at least, turn upon itself iu order to preeent its heaviest part, or side, to tbe universal centre of gravity. In this manner a planet's axial motion commences.

By this incipient rotary motion, other parts of the planet'e surface at the morning side enter into the column of solar heat and move through it during the day; while at the evening side, other parts, equal in longitude, recede from the column of heat, and move through the cooler temperature of the night; so that every part of the planetary surface is alternatively and successively made lighter during the day, by evaporation and exhalation, and heavier during the night, by recondensation and absorption.

In this manner, like an overshot wheel descending at one side with full buckets, and ascending at the other side with empty buckets, the planetary globe ie constantly made heaviest at the side where day commences, and lightest at the opposite side, where day ends and night begine. By thie constant transferriug of weights from the occidental to the oriental eide, the planet ie compelled to continue its rotary motion. Thus its axie, poles, cardinal pointe and diurnal motion are eetahlished.

Orbital Motion.

The constant diurnal evaporation generates a permanent, excessive profusion of atmoepheric vapore at the planet's evening eide; and the equally constant nocturnal recondensation of vapors cansee a permanent quasi-vacuum at ite morning side.

A superabnudance of vapors, of atmoepheric matter means puleion; and the ecarcity or want thereof means traction.

A planetary globe which for ages has been falling through incalculable distancee, which through the universal centrifugal force wae drawn from its native regione, was attracted from the bonndariee of the nniversal space toward the universal center of gravity, can no longer pureue its etraight downward journey; it cannot, like the globee formed in regions less remote, fall into the sun. The planetary globe, fortified by the two forces, its incipient rotation has just brought forth; that is, traction at its oriental eide and pulsion at its occidental side, ie now capable of making the primordial steps in its planetary career. By thie double atmospheric force, the planetary globe is impelled in a route at right angles with the line it has hitherto pursued. It is now forced to deflect from that line, and to move for a while in a volute-like way, from the point of deflection toward tho central globe till, through the combined forces of thie twofold atmospheric impellent and the attractiou of the two globes, eun and planet, exert upon each other, the momentum the planet acquired by its fall is overcome, till the distance between the two globee is reduced sufficiently to found an equilibrium between the impelling and the centripetal forces, till a regular orbit for the young planet is establisbed. The orbit would be circular, were it not made elliptical through the orbital motion of the snn.

Obliquity of the Orbit.

The plane of a planet'e orbit is oblique to the plane of the solar orhit in proportion to the inclination of the planet'e axis to the plane of its orbit; so that one part of the planetary orbital rcnte may be north, and the other, the opposite part, eouth, of the plane of the solar orbit.

The snn, as to its orhital path, is always in the foremoet, in the lower focus of the planetary orbital ellipse.

The elliptical form of ths planetary orbit shows that the dietance between sun and planet must be continually varying; and that therefore, without permanent impellent, a constant equilibrium between the centripetal and centrifngal forces, together with the velocity of the planet'e orbital motion is a mere impossibility. It makes it evident that a permanent impelling force ie reqnisite, ie indespensible to effectuate planetary motione.

To exemplify, let the planet Earth be examined in all its positione and movements.

Thie planet, when in aphelion, is 92,965,489 miles dietant from the snn, and bnt 89,894,951 miles wben in perihelion; the mean distance between the two epheree is calculated to be 92,500,000 miles. The world Earth tnrns npon its axis abont 365 times while it makee one revolution round the sun. When in perihelion it is 23° 28′ north of the sun, and 23° 28′ south of that luminary body when in aphelion. Thns it is plainly seen that there ie a difference of 3,070,538 miles between tbe greater and the lesser distance. It ie also obvione that the planet, in its orbital conrse, makes two movements opposite the one to the other: one from north slightly southward, and the other from south elightly northward.

Now a difference of over three millione of milee in distence must greatly change the efficiency of the attraction the two globes, sun and planet, exert upon each other; it certainly would, in the absence of a permanent impelling force, render tbe regular continuation of all planetary motions impossible. Without the atmospheric impellent these two movements in opposite directions, like all other planetary motions, are simply inexplicable.

The forces that generated, and perpetuate the axial and orbital motions of a planet, being nnderstood, little will he needed to ehow how these two oppoeite motions are caused and regulated by the same agencies, hy the very atmospheric impelling forces.

Iu order to he brief, and to avoid equivocation, it will be proper to make the following remarks:

1st. Let the circle that separates day from night, go nnder the neme of dionox.

2d. Let the point where the atmospheric envelope is thicker than at any other point of that hollow spheroid, he called the point of pulsion; and the opposite point, where the atmosphere is thinest, the point of traction.

3d. Let the eun, as the universal center of gravity, be called the lower of the two globes; and all the parts of the planet, which are nearer the sun than their opposites, be considered as the lower; and the corresponding oppoeite parts, as the higher.

May it be horne in mind, 1st, That the plane of the dionox is alwaye at right angles with a line, drawu from the center of the sun to the center of the planet. 2d. That the poles of the atmospheric epheroid, permanently situated in the dionoxical circle, are always moving spirally over the glacial zones from center to circumference, and *vice versa*. 3d. That the point of traction and the point of pulsion are always eitnated in the equatorial plane of the vaporoue epheroid; the firet point a few degreee below, and the eecond ae far above the dionox; not exactly in that circle, becauee, effects generally, like the tidee for inetance, are posterior to their causes. 4th. That a line running from the one point to the other passes throngb the center of the planetary globe, and that the two atmoepheric forcee—traction ahead and pulsion behind—repreeented by these two pointe, combine to impel the planet in the direction of that line, which through attraction and the enn'e orbital motion ie tranеformed into an ellipee. 5th. That the axial motion of the vaporone epheroid is more rapid than that of the solid ephere, and that tbie difference in speed generatee an aerial current from west to east.

Now, when the world Earth is in perihelion neareet to the snn—when attraction is most powerful—one eeee at a glance that the orhital movement of the planet must have been accelerated in order to generate a centrifugal force adequate to counterbalance the increased centripetal power. Well, as it is with a locomotive, the intenser the heat nnder ite boiler, tbe more steam is generated, and the more steam there is applied to its cylindere, the ewifter the machine epeeds over its track. So ie it with a planet—the nearer the eun it is moving, the more effective is the solar heat npon the planetary globe; the greater the intensity of the eolar heat, the greater is the quantity of moisture extracted from that globe and traneformed into vapors dnring the day; and, inversely, the more vapore are recondensed dnring the night. Consequently, the greater the superabundance of vapore at the occidental eide, and the greater the void at the oriental side of the planet, the more efficacioue is the double atmospheric impellent. Thus, it is evident that the velocity of the orbital motion of a planet is regulated by the atmoepheric impellent, tbe efficiency of which increases in proportion the distance between planet and sun decreases; and, inversely, decreases as the distance increases.

Now, as to the uorthward and southward movements, a diagram representing the planet, with its atmosphere, and its position relatively to the sun, showe that the point of traction lies south, and the point of pulsion north of the planetary equator; the former point heing always below, and the latter alwaye above the dionox; thus, it is plainly seen that the line from the point of pulsion to the point of traction is slightly verging toward the south; and that the planet, while being impelled from perihelion to the vernal equinoxial point, is alro forced to move southward. The velocity of the planet's orbital motiou from perihelion to aphelion sleckens, as the planetary globe diverges farther from the source of heat.

While the planet is impelled from perihelion to aphelion, the two points, representing the acmes of the atmospheric impellant, slowly and in opposite directions move toward the planet's equator, and cross that circle when the earthy ephere passes the equinoxial point, and then again recede from that circle till the planet reachee aphelion. In this point of the orbit, tbe point of traction, at first south, is now north of the planet's equator; and the point of pulsion is now eouth of that circle, while it was north of it when eerth was in perihelion. Here again, the line from the point of pulsion to the point of traction indicates the route along wbich the planetary globe is impelled. It is easy to see that the world Earth is towed and propelled from aphelion slightly nortbward to the autnmnal equinox and thence to perihelion.

In this part of the orbit the velocity of the movement is increasing in proportion the distance between the two globes decreases, in proportion the atmospheric impellent is made more efficacioue.

The eonthward movement from the vernal equinox to aphelion, and also the northward motion from the autumnal equinox to perihelion, partly result from the momenta the planet acquired by its motions from the solstice to the equinoxial points.

At the equinoxial points, when the planet crosses the plaue of the solar orbit, its axis and that of the atmospberic epheroid are in the same line, and the equatore of the two bodies are in the same plane; while, as has been said before, there is an angle of 23° 28′ between the two axes, and an equal angle between the two equatorial planes when the planet is in either of the solstices.

Irregularity of the Diurnal Motion.

When the planet is in either of the solstices, the atmospheric impellent acte upon it, in a direction oblique to its equator and to its meridians. By this indirect action the axial motion of the planet is retarded. And while it is in either of the equinoxial points, the actions of the atmospheric impellent upon the planetary globe are in line with the equator and the parallels of the earth sphere and at right anglee with its meridians. Thus it ie plainly eeen that, as to the diurnal motion, the double atmospheric motive power is most efficacious at those points. It is obvione that at these points, it forces the planet to turn npon its axis more rapidly than at any other point in the orbit. Hence it follows, that the axial rotation is gradually accelerated as the planet moves from solstice to equinox, and retarded as it moves from eqninox to solstice. Be it remembered that effects are seldom instautaneous with, but geuerally posterior to their canses.

The motive power that causes these accelerations is most effective when the planet is impelled from aphelion toward perihelion; whilo then the distance between the planet and the source of heat is gradnally decreasing.

CHINESE SILK.—Silk first came from China, and the Chinese have many important secrets connected with it unknown to Europeans. In a good year they eend as much as $25,000,000 worth of raw eilk to England alone. The "hanke," or booke, as they are called, arrive with cape made of a single cocoon. Thie is done by a procese unknown in Europe.

M. FLEISCHEN has made a compariеon between the bark of young oaks grown reepectively upon eandy loams, upon peaty eoile that had been once burned, and npon a eimilar eoil that had thrice heen hurned, aud found the proportion of tannin highest in the prodnct of peaty soils.

MECHANICAL PROGRESS.

Different Varieties of Steel.

The following correct definitions of the different varieties of steel by William Metcalf, of the Crescent Steel Works, Pittsburg, Pa., are published in a circular by the Dexter Spring Co., of Hulton, Pa.

Originally the word steel was applied only to iron which contained such quantities of carbon as would cause hardening when the red-hot iron was cooled suddenly.

This definition still applies, but, in addition, the term cast steel applies to all of the products of the crucible, the Bessemer converter, and the open-hearth furnace, whether such products are too low in carbon to harden or not. The steels that are not cast steels are known in the market as blister steel, German steel, shear steel, and double shear steel.

Blister steel is made by heating bars of wrought iron, bedded in charcoal, in hermetically sealed chambers. The carbon of the charcoal penetrates the hot iron, converting it into a crystalline mass of crude steel; large blisters rise on the surfaces of the bars, giving the name blister steel to this product.

German steel is blister steel rolled down into bars. It is used mainly for tires and common springs, but is being rapidly superseded by the cheaper grades of cast steel.

Shear steel is made by taking a high heat on blister steel and hammering it thoroughly. Double shear steel is made by cutting up shear steel, piling it, heating it, then hammering it again. The best shear steel must be made from the best wrought iron. The shear steels are very useful on account of their toughness and the ease with which they can be welded to iron, and, when of good quality and well worked, they will hold a very fine edge.

Crucible steel is made by melting in a crucible either blister, or blister steel and wrought iron, and charcoal or wrought iron and scrap steel, or, in short, a great variety of mixtures, which depend on the quality of steel to be produced.

Crucible steel can be applied to any purpose for which steel is used. Generally, it is better than any other steel—that is to say, crucible steel made by melting blister steel and tempered to suit by mixing iron of the same grade in the crucible is always better than German or shear steel made from the same blister.

Bessemer steel is made by blowing air through melted cast iron, thus burning silicon and carbon out of the cast iron. After the silicon and carbon are burned out, melted spiegeleisen or ferro-manganese is added to the charge. The carbon in the spiegel re-carbonizes the steel to the desired point, and the manganese unites with and removes the oxygen which the air used leaves in the steel.

Open-hearth steel is made by melting, in a very hot furnace, a charge of pig iron. To this method, iron, which is called the "bath," is added either wrought iron, or scrap steel, or iron ore, and the whole is kept hot until all is melted. The wrought iron, or scrap, or ore, reduces the carbon and silicon in the bath to such proportions as are desired in the steel.

Bessemer and open-hearth steel are much alike in quality. They are used mainly for rails, boiler plates, ship plates, bridge and other structural purposes and machinery. The better qualities are also used largely for springs. The best spring steel, like the best tool steel, is simply that which is made from the best material. Quality of material, chemically speaking, being equal, the best spring steel is that which is made from crucible cast steel, as the crucible process is less crude than either of the others.

AN IMPORTANT IMPROVEMENT IN GUNNERY.—Mr. Krupp has introduced an important improvement which it is thought may lead to a material reduction in the expenditure on ordnance. All the heavier Krupp guns consist of a steel body strengthened by hoops, the 30½ centimeter guns having three tiers of hoops, the 26-centimeter and 24-centimeter two, and the remainder one tier. The interior of the body, or the bore of the gun, being the part subjected to the greatest wear and tear, becomes rapidly worn out, and hitherto it has been found necessary after, at the very most, 1,000 rounds have been fired, to melt up the whole gun, on account of the damaged condition of the bore, although the outer parts of the piece were practically as good and sound as ever. Since the construction of these outer hoops is very costly, the idea occurred to one of the members of the firm that it might be possible to localize the melting operation, and this it has now been found possible to accomplish by treating the body of the piece with a cold-producing preparation of carbonic acid, which contracts it to such an extent that the hoops, expanded at the same time by the application of heat, can be easily removed.

AN IMPROVED GIN SAW GUMMER has been patented by Mr. John B. Clopton, of Elgin, Texas. The object of this invention is to furnish gin saw gummers, so constructed as to shear off the surplus metal in a solid piece from either side of the teeth, and thus bring the teeth to a point, making all the teeth of a uniform shape and size.

A New Alloy.

Referring to Prof. Thurston's recent experiments with copper tin alloys, the *Engineer* makes some very interesting statements concerning an alloy called "naval brass." It appears that in the early part of 1874, in consequence of numerous cases of failure in respect to Muntz metal in ships of the Royal navy, the attention of the Admiralty was drawn to the subject, and they directed inquiry to be made as to the cause of these failures. Mr. Farquharson, to whom the matter was referred, found that the causes of decay which had been suggested would not account for that which actually took place. In the numerous cases which came under his notice, two conditions of use were always observable, namely, salt water and contact with an electro-negative metal—a fact which pointed strongly to electro-chemical action as the cause of the change. On the other hand, there was a total absence of surface-pitting. To the eye the surface of affected bolts was as smooth and perfect as when they were first made. It was difficult to understand how an internal change, such as actually took place, could come to pass in the way inferred.

Fortunately, a very simple expedient proved beyond a doubt that salt water had *penetrated* an apparently sound and close metal, and the mystery was thus dispelled. Bolts 3½ inches in diameter, which had been used for securing propeller blades, were shown to have been thus penetrated to the center. In view of these facts, the conclusion that a portion of the zinc had been dissolved out was inevitable, and this explanation has been thoroughly verified by comparing analyses of affected and unaffected parts of the same bolts. The circumstance that no such change was to be found in any of the numerous varieties of gun-metal, rendered it probable that it was peculiar to alloys of copper and zinc, so that if a forgeable metal could be produced with tin in its composition, having the requisite strength and ductility, the alloy thus formed would be free from the defect complained of.

In the latter part of the year an alloy, composed of 62 parts of copper, 37 of spelter and 1 of tin, was proposed by Mr. Farquharson, as possessing the requisite mechanical properties. The Admiralty thereupon referred the question as to the endurance of such metal to Dr. Percy, of the Royal School of Mines, in conjunction with Mr. Farquharson. These parties, after subjecting an alloy of this description to severe tests, under which the Muntz metal completely failed, reported to the Admiralty in 1879 that the new compound had stood the tests satisfactorily. Accordingly it was adopted as the service alloy under the title of "naval brass."

The process of manufacture is the same as for yellow or Muntz metal. To insure the best results, Australian or English B. S. copper should be used, and the proportions of metal stated above, closely adhered to, due allowance being made for the loss of zinc in the process of melting. When finished cold, and left unannealed in rods and sheets of moderate thickness, the metal has a tensile strength of from 67,000 lbs. to 72,000 lbs. per square inch, according to the amount of rolling it has received. Bolts of any size can be made of it, the usual practice being to take a rod the size of the bolt required, and to form the head by upsetting in a die. This is done, without stress or injury to the metal, in a bolt or rivet-making machine with heads two diameters of the bolt.

THE COMING MOTOR.—The recent discovery of an improved form of portable electricity seems to have opened anew the inquiry as to what will be the "coming motor." The "Keeley motor" seems, after a brief resuscitation, a few months since, to have again been relegated to the things of the past. In the meantime, Prof. Gamgee is trying to talk and write up his "zero motor." This power is supposed to be developed by some kind of evaporation. It is assumed that the details are set out in his letters patent, but we believe no one, unless it be the professor himself, has yet been found who professes to understand, even from his description, what he has got. To the ordinary mind "it is as clear as mud how he does and how he don't do it." Hence it appears that the dear public must get along as well as it can with ordinary steam until some "new thing" is fairly removed from the realm of the experimental.

IMPROVED ARMOR PLATES.—The armor plates for the new British war vessels are made on a new plan. Around an iron armor-plate backing is placed an iron frame, on the top of which is placed a two-inch plate of iron of the same size as the iron plate. The three pieces having been bound together are brought to a welding heat, and the space between the two plates filled with cast steel. When the whole is cooled it is re-heated and rolled down to the desired thickness. Three rounds from a 125-lb. Palliser gun loaded with 50 lb. charges and fired at a distance of 30 ft., made penetrations of only 5 inches, 4.9 inches and 5.6 inches respectively in one of these composite plates, 8 ft. long, 5 ft. 9 inches wide, and 10½ inches thick.

LOOSE PULLEYS.—Loose pullys require constant attention and much oil, and are very hard on the belt. It is best to have them a trifle smaller than the tight pulley, and with a step or flange running up to the diameter of the tight one. This takes the strain off the belt and the friction from the pulleys.

SCIENTIFIC PROGRESS.

Storage of Electricity.

Mr. Osborn Reynolds, of Owen's College, England, writes to the *London Times* in regard to Sir William Thompson's letter to that paper, of a previous date, as follows:

The means of storing and re-storing mechanical energy form the aspiration of not only Sir William, but of every educated mechanic. It is, however, a question of degree—of the amount of energy stored as compared with the weight of the reservoir, the standard of comparison being coal and corn. Looked at in this way, one cannot but ask whether, if this form of storage is to be the realization of our aspirations, it is not completely disappointing? Large numbers are apt to create a wrong impression until we inquire what is the unit. Eleven million foot-pounds of energy is what is stored in one pound of ordinary coal. So that in this box, weighing 75 pounds, there was just as much energy as in 1½ ounces of coal, which might have been brought from Paris or anywhere else in a waistcoat pocket, or have been sent by letter.

When we come to the question of the actual conveyance of energy for mechanical purposes, this view is of fundamental importance. The weight of the same amount of energy in this new form is 800 times greater than the equivalent amount of coal; and as a matter of economy, supposing that energy in this form might be had at a certain spot and no capital were required for its conversion or storage, and that the energy were directly applicable, it could not be carried 10 miles—that is to say, such energy cannot be economically useful 10 miles from its source, although coal had to be carried 100 miles to the spot. This limit, in truth, falls far short of what has been already attained by other means. By wire ropes and by compressed air or steam, energy may be economically transmitted from ten to twenty miles. So that if this is the utmost of what is to be done by means of the storage of electricity, this discovery adds another door to those which are hopelessly closed against the possibility of finding in Niagara or other water power a substitute for our coal, even when this object is motive power, and much more for that purpose for which five-sixths of our coal is used—the production of heat.

It is very important that the people of this country should not shut their eyes to the fact that so far from there being a greater prospect of the solution of the problem than when, about twenty years ago, Prof. Jevons raised the alarm, the prospect is now much smaller. In the meantime the capabilities of steel ropes, fluids in pipes, and electricity along conductors have been not only investigated, but practically tested and found altogether wanting. And now it would seem that the storage of electricity must be added to the list.

HOW TO DETECT CARBONIC OXIDE IN THE SMALLEST QUANTITIES.—One of the important sanitary problems is to detect in the air of our dwellings very small admixtures of carbonic oxide. The following test, furnished by Vogel, has long been regarded as the most simple and unfailing: To a flask of water exposed to the air under examination, add blood very much diluted. Carbonic acid is shown by the immediate reddening of the mixture. The addition of ammonia sulphide does not banish the absorption lines in the spectroscope as with ordinary diluted blood. The test will show the presence of a portion as small as 0.25 of 1%. Experiments show, however, that the oxide may not all be absorbed in this manner. Dr. Walter Hempel used the lungs of living mice to gather the gas from the room. The mouse experimented upon is then drowned, and blood from the region of the heart is tested with fresh, colorless ammonia sulphide. In this way 0.03 of 1% can be easily detected, and strong symptoms of poisoning are shown with as little as 0.05 of 1% of the gas. Since carbonic oxide is not, like carbonic acid, an unavoidable ingredient of the atmosphere, it becomes a matter of great importance to determine and prevent its presence.—*Scientific American.*

INFLUENCE OF MAGNETISM ON ELECTRICAL CURRENTS.—At a recent meeting of the Physical Society, London, Mr. Hall, of John Hopkins' University, Baltimore, exhibited his experiment in which a current of electricity flowing longitudinally along a thin foil of metal is caused to yield a transverse or lateral current by inserting the foil between the poles of a magnet. The lateral current is observed on a sensitive galvanometer, and care is taken in the first place to find points of connection with the foil which yield no current before the magnet is applied. The results were that if iron is called + the series is iron +, silver −, gold −, platinum −, tin −, and, curiously, nickel, though a magnetic metal like iron, is −; but on inquiry of Prof. Chandler Roberts, it proved that the nickel employed was, perhaps, impure. Cobalt ranges between iron and silver, and is + like iron.

A FRENCH inventor has patented an application of the electric light to the bleaching of textilee and other substances.

No Tarantulas in California.

Mr. Rivers, the well known orator of the Museum of the State University, has been interviewed with the following result:

"Is that hairy, long-legged thing I see in the case, a tarantula?"

"No, there are no true tarantulas in California, but it is what is known on this coast as a tarantula. The tarantula proper belongs to Europe, and especially Spain, and the first-comers here being from that country, and seeing something which, to their unscientific eyes, seemed just the same as their own tarantula, they named it accordingly. Its true name is the trap-door spider, so called from the curious doors they build to close the entrance of their nests. There is one of the nests. You see it has a perfect trap-door lifting on a hinge, and constructed of dirt held together by some mucilaginous substance. It fits tightly into the mouth of the hole, which is a perfect circle. Do you know, it puzzled me greatly when I first came to this coast how that long-legged thing was to get into any of these small holes, which, as you see, are about half an inch in diameter. You see his body above is nearly as large as the hole, and it would be necessary to take off his legs altogether to get him safely inserted in the nest. I thought at first that they were endowed with the power of articulating, or casting off their limbs as some animals do—the crab, for instance—but I afterward found out that these are the males, and they never go into the holes, which are nests and not houses. The female is very much smaller and attends to all that business herself. When she gets through with her husband, she eats him up, I suppose," said Mr. Rivers, with a quiet twinkle, "to see that he does not go wrong afterward."

"How does this species differ from the true tarantula?"

"Do you see those venomous looking nippers or mandibles which turn downward in this spider? Well, in the true tarantula those mandibles extend out horizontally in front of the animal. That is the main difference, and the mistake made by the first-comers to this coast was a very natural one to any but a trained naturalist."

CARNELLEY'S HOT ICE.—The remarkable announcement by Prof. Thomas Carnelley some time ago (which was reproduced in these columns) to the effect that he had been able to heat ice burning hot without melting it, has met with a great deal of scientific scepticism both at home and abroad, although the experiments of Mr. Carnelley were clearly explained and his reasoning appeared to be sound. It is submitted that the result was deceptive in some way, and in the last number of the *Journal* of the Chemical and Physical Society of St. Petersburg, Prof. Boutleroff states that he has carefully repeated Prof. Carnelley's experiments in every particular, but finds that instead of becoming so hot as to be intolerable to the touch, the ice really remained at a temperature of 6 deg. Cent. below zero. Prof. Boutleroff therefore concludes that Mr. Carnelley had raised the temperature of his thermometer without raising the temperature of the ice, and this is the more likely as ice is very transparent to heat, and warm vapor liberated by the melting ice might reach the bulb of the thermometer imbedded in it by small cracks and crevices. In one experiment Prof. Boutleroff accidentally raised the thermometer to + 40 deg. Cent.

EFFECT OF PRESSURE IN CARBONIZING WOOD. Herr Gopport has lately exhibited a piece of pine which has been submitted for two years to a pressure of 12½ tons in a Silesian mine. It had been compressed to one-fourth and converted into a half carbonized state through the action of pressure alone, as little moisture had access, and the temperature was never above that of the surrounding atmosphere. It had quite the appearance of a dark-brown colored bituminous wood of the tertiary brown coal formation, but it was without the smell observed in burning bituminous wood. The change of volume was at the cost of the water-contents of the wood. A considerable amount of oxygen and hydrogen had come off as water, and the composition approximated to that of peat of the older peat formations.

THE American Society of Mechanical Engineers will hold a "midsummer meeting" at Altoona, Pa., August 10th, 11th and 12th. Altoona is high up in the mountains and has some reputation as a summer resort, which an excellent hotel has doubtless helped materially. The place to railroad men is perhaps the most interesting in the country on account of the vast central shops of the Pennsylvania railroad there, which will doubtless be a chief subject of study at the meeting. It is reported that an excursion will be made to visit the Cambria Iron Works, also one of establishments which mechanical engineers will most like to see.

FREEZING MERCURY.—During a lecture recently delivered at the Paris Conservatoire, M. Raoul Pictet coined a medallion in mercury weighing over 33 lbs. The lecture was on "The Industrial Application of Artificial Refrigeration," and the quicksilver was frozen in the Pictet apparatus.

PLATINUM is stated in the books to have the atomic weight 197.2; but Herr Seubert, after much research, concludes that its atomic weight is 194.46.

The Mining Share Market.

The mining share market is not in an active or lively state, yet dividends are being paid hy many mines. The following mining dividends, says the *Bulletin*, have been disbursed, principally in San Francisco, during the first half of the current year:

	No.	Amount.
Deadwood-Terra, Dakota	6	$ 280 000
Eureka Con, Nev	6	150,000
Father de Smet, Dakota	4	100,000
Great Western Quicksilver, Cal	1	12,500
Homestake, Dakota	6	180,000
Idaho, California	6	124,000
Indian Queen, Nevada	6	38,750
Navajo, Nevada	1	25,000
New York, California	6	60,000
Northern Belle, Nevada	6	187,500
Napa Con. Quicksilver, California	2	20,000
Ontario, Utah	6	375,000
Silver King, Arizona	6	120,000
Standard Con, Cal	6	450,000
Western, Arizona	6	450,000
Totals	77	$2,002,750

These 15 mines in the course of six months have done a trifle better than the California and Con. Virginia used to do in one month. It is proper to remark that the Deadwood-Terra, Father de Smet, Homestake, Indian Queen, Napa Con. and Ontario mines disburse their dividends very largely in New York and Boston.

In connection with the foregoing it is well to give the mining dividends paid during the same interval in New York and other places. For a statement of these we are indehted to the *Mining Record* of New York. The list is as follows:

	No.	Amount.
Alice, Montana	4	$ 160,000
Boston & Montana, Montana	4	80,000
Consolidated Gold, Georgia	2	8,000
Catalpa, Colorado	3	180,000
Calumet & Hecla Copper, Michigan	2	1,000,000
Central Copper, Michigan	1	60,000
Dunkin, Colorado	6	110,000
Evening Star, Colorado	7	175,000
Gold Stripe, California	3	67,500
Green Mountain, California	6	53,125
Glass-Pendery, Colorado	1	25,000
Hibernia, Colorado	4	120,000
Iron Silver, Colorado	2	200,000
La Plata, Colorado	6	90,000
Plumas-Eureka, California	1	105,000
Polonia, Colorado	1	12,000
Osceola Copper, Michigan	2	150,000
Quincy Copper, Michigan	1	200,000
Richmond Con. Nevada	2	270,000
Robinson, Colorado	1	50,000
Rising Sun, California	2	25,375
Sierra Buttes, California	1	30,000
Spring Valley, California	1	50,000
Starr-Grove, Nevada	6	120,000
Tombstone, Arizona	6	300,000
Totals	75	$3,641,500

The sources of these dividends are as follows:

Location.	Mines.	Dividends.
California	11	$ 908,000
Nevada	6	701,250
Utah	1	375,000
Arizona	5	900,000
Dakota	3	500,000
Colorado	9	962,000
Montana	2	240,000
Michigan	4	1,410,000
Georgia	1	8,000
Totals	40	$6,244,250

Nearly half of the amount from the California mines came from the Standard Con. in Mono county. The Richmond Con. paid nearly one-third of the Nevada dividends.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

ORO GRANDE M. Co.—July 19. Location: Roses Bar, Yuba county, Cal. Capital, $10,000,000. Directors—W. H. H. Hussey, R. J. Graham, C. J. Smitb, B. Gallagher and A. Hay.

ITHACA CON. M. Co.—July 20. Location: Arizona. Capital, $6,000,000. Directors—John Jeffrey, J. T. Hall, Wm. Grainger, W. W. Hickiss and F. C. Cravens.

ASTOR CON. M. Co.—July 22. Capital, $600,000. Directors—J. Jeffrey, J. T. Hall, W. Grainger, W. O. W. Hickiss and F. C. S. Cravens.

ASTOR CON. G. & S. M. Co.—July 22. Location: Storey county, Nev. Capital, $10,000,000. Directors—B. F. Dahl, V. Rossayze, M. C. Southard, C. H. Redmond and S. Purdy.

CALIFORNIA CENTRAL RAILWAY Co.—July 25. The road is to run from Fresno Flats to McBride's pass, on the State line. The estimated length is 150 miles. Directors—W. W. Walker, A. H. Washburn, Lyman Bridges, P. W. Johuson, Samuel Miller, R. P. Layton, E. W. Chapman, W. L. French and J. W. Kinkead. Capital, $7,500,000. It is reported that the road is to he the Pacific branch of Jay Gould's transcontinental railway scheme; that it will he a branch of the Union Pacific road, intersecting the South Utah, Atlantic and Pacific and Texas-Pacific roads at Pahranagat valley, Nevada, toward which all the latter roads are converging. A week ago a New York telegram to the press of this city, stated it was reported that Gould would build a road from Salt Lake to San Francisco.

CENTRAL PACIFIC R. R., SAN JOAQUIN DIVISION.—July 25. Capital, $6,000,000. Directors—W. W. Walker, A. H. Washburn, Lyman Bridges, P. W. Johnson, Samuel Miller, R. P. Layton, E. W. Chapman, W. L. French and J. W. Kinkead. The road ia to run from the southern terminus of the San Francisco and Ocean Shore railroad at Santa Cruz, to a point near Mintern, in Fresno county, connecting with the Yosemite Division of the Central railway. The estimated length of the road is 120 miles.

YUMA, PORT ISABEL AND GUAYMAS R. R. Co.—July 13. Location: From Yuma to Port Isabel on the Gulf of California. Directors—Chas. Crocker, George Crocker, T. Hopkins, C. P. Huntington and Leland Stanford.

THE Wood River *Times* says: Develop your claims. Don't wait for capitalists to huy you out. If you only have a six-inch seam of ore in sight the chances are, that, hy hard work and economical living, you can manage to "keep your head ahove water" until you have a paying mine. If you sell to capitalists now, you can't get half the value of your claim, and you must romain poor.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

OREGON.—Monitor *Argus*, July 25: The mining claim known as the "Oregon," and formerly as the Morning Star claim, situated on the Morning Star hill, in this county, has been sold to a London company for the sum of $7,000. Mr. Lewis Chalmers, of Alpine county, is the party who has brought about this trade. This is thought to he one of the most valuable properties in the county, and our only wonder is that it should change hands at so low a figure; and we verily believe that before another year rolls around, this property will be worth $1,000,000. There seems to be much rejoicing by the community in general by reason of this valuable property falling into the hands of a company who will at once proceed to more thoroughly develop it.

ORE.—H. C. Ginn was in town yesterday, and made arrangements to repair the wagon road between Monitor, Moqui and the Morning Star mine, he having contracted to haul the ore from the mine to Silver mountain for reduction. The work will commence to-morrow under Mr. Ginn's personal supervision.

TRIUMPH.—The owners of the Triumph mine, near Bagley valley are sinking 2 shafts on their claim to find the extent of the ledge. During the past week 1 shaft was sunk 16 ft; the other, 12 ft—in quartz rock. A number of assays were made yesterday from the bottom of each shaft, and from the countenances of the prospectors, we should judge the ore to he of very good grade. They have all returned to the mine to-day to give it a further test.

AMADOR.

THE STEWART MINE.—*Dispatch*, August 2: The 5-stamp mill on the Stewart mine, owned hy Mr. Robert Stewart, of Volcano, situated on the Mokelumne river just below the West Point bridge, is now in operation crushing the quartz from that mine. No clean-up has yet been made, but it is thought that the rock will yield from $60 to $100 per ton. There are 3 well-defined ledges at the points now worked, which are reached by means of tunnels run into the mountain; but from the angles of their dips, it is evident they will all come together when followed down to the proper depth, when it is believed the mine will prove second to none in the county in extent and riches. The veins are now respectively about 1½ ft, 3 ft and 4 ft wide, and the mill is conveniently situated near the mouth of the main tunnel, and has an immense water power with which to operate, being located several hundred feet below the Amador canal. This mine is destined at a very early day to take its rank with the first mines in this section of the State.

PACIFIC.—Amador *Ledger*: The shaft of this mine is down over 800 ft. The intention is to siuk to the depth of 1,026 ft before commencing to drift. As this shaft is perpendicular, this depth is equal to about 1,400 of the Empire, which is an incline shaft.

MISCELLANEOUS.—Work was commenced on Doyle's claim, in Hunt's gulch, on Monday. James Morgan has two men working on the Amador Queen claim, near the tunnelitg operations at Murphy's ridge. The Oneida will sink a new shaft, so it is rumored.

BUTTE.

BIG GOLD BRICKS.—*Mercury*, July 30: Saturday afternoon Supt. Waldeyer, of the Spring Valley mine, brought down from Cherokee 400 lbs. of gold. It was divided into six bars, and was worth $112,000.

CALAVERAS.

ACTIVE.—Calaveras *Chronicle*, July 30: During the week we visited most of the mines in Chile gulch and Tunnel ridge, and, with the exception of some of the hydraulic claims, which are closing for the season on account of the insufficiency of water, we found them all actively prosecuting work. The Sullivan tunnel, at the head of Chile gulch, was worked many years ago and abandoned. Wm. Sullivan, the present owner, has found ground which he has every reason to believe will pay good wages. Farther down the gulch we reached the tunnel claim, La Belle France. This is another very old claim, formerly known as the "Bob Paul claim." It has yielded immensely, and continues to make hig returns. Work goes on uninterruptedly. Below this claim is the Gleeson mine. Work is being pushed with vigor in this mine. There are first-rate hoisting works on the mine, run hy water power, and everything is working smoothly. Gravel has been reached, but the tuunel is continued on in order to strike the main body of the channel. The owuers feel confident of finding good ground. South of this mine is the Duryea hydraulic claim. Here, too, all is activity—16 men being employed. The claim is in fine running condition, everything being provided with which to facilitate operations. A large amount of gravel has been washed down, and the powerful derrick, run by water power, has proved an invaluable auxiliary. An enormous mass of huge lava chunks and bowlders have been lifted out of the way, which would otherwise have to he broken up, thus saving a great deal of time and labor. Farther on, but on the opposite side of the gulch, is the Brown & McSorley claim, the tuunel penetrating into the noted Tunnel ridge. This is one of the best tunnel claims in this section. It has been worked steadily for a long time by the present owners, and their labors have been well rewarded. There is an immense body of gravel, and uniformly rich, making it a lasting and remunerative property. We learned in the course of our round among the claims in this neighborhood that Mr. Geo. Green, one of the most experienced miners of this section, in company with other parties, is about to re-open and work what is known as the "Bratchett claim." We understand that an incline tunnel will be run to tap the lead. The next claim to take the McCann tunnel, now owned by McCann & Rigney, is penetrates into Tunnel ridge a distance of several hundred ft. Very rich dirt has been struck lately. There is a large pile of gravel on the dump, which prospects handsomely. Adjoining this claim and above it, is the Penobscot hydraulic, run by the experienced hydraulicist, Mr. Geo. Emerson. The season's run is completed, and the work of cleaning up is going on. This claim, too, is provided with all the requirements for working expeditiously, and, running 500 inches of water during the past season, some heavy work has been done. Leaviug the Penobscot and continuing our way, we next arrived at the Mammoth hydraulic, owned by J. F. Veith, Esq. Here hands were at work cleaning up after quite a run. The ground is good, and there is any quantity of it, and the indications are that this last run will be a very remunerative one. It is bound to he away up in the thousands. We next visited the adjoining hydraulic claim, the Bonanza, owned by S. S. Moaer & Co. Since our last visit to this claim, work in the upper portion has been suspended, and operations commenced in the lowor part, in order to work the whole to greater advautage. There is no "let up" in this claim. Work goes on the year round, and the owners never fail to receive liberal compensation. The gravel is rich, and the mine will last a generation.

EL DORADO.

GREENWOOD DISTRICT.—Georgetown *Gazette*, July 30: Perhaps among the most valuable mines in this county, and we might say in the State, are the New Dunker Hill and the New El Dorado copper mines, owned by Messrs. Stanley, Watson, Shepherd and Ricci. These mines are located in the Greenwood mining district, about half way between this place and Auburn. A few days since we were shown some beautiful specimens of ore taken from the New El Dorado mine. The assay of the ore taken from the same place as the specimen showed was, showed that the rock contained 64% of copper, with a good prospect of gold and silver. There are thousands of tons of the ore in sight, and seemingly the supply is inexhaustible. There is an immense ledge dipping to the east at an inclination of about 65°. Occasionally pieces of pure "na-

tive copper" are found as large as a walnut, and from that to the size of a man's fist. If a few more such mines as these be developed on this divide, it will place our part of the county among the foremost mineral districts in the State. We understand that parties from the East are negotiating for these mines, and from present prospects the people in the vicinity of Penobscot will soon have their ears regaled with the ever welcome sound of the steam whistle.

EUREKA.—The main ledge of the Eureka was tapped on Tuesday from the lower or 230 level, a distance of 33 ft from the shaft. The ore prospects well, estimates being made all the way from $20 to $50 per ton in free gold, by simple mortar tests made the day following. So far the rock certainly improves in depth. Next week we will be able to give something more definite.

MINING SUCCESS.—*Mountain Democrat*, July 30: Milo Oldfield and George Johnson are doing remarkably well in a gravel claim at Spanish hill, belonging to the Blair Bros., which Messrs. Oldfield and Johnson are working on shares.

MARIPOSA.

RICH ORE.—Mariposa *Gazette*: We learn that very rich ore has been taken from the Santa Domingo quartz mine, near Hornitos. Zamora and Armenta are the proprietors.

RICH PLACER MINE.—We are informed that Dr. Kellet, of Hornitos, is engaged on Burns creek in opening up an old placer claim of great depth. He has fine prospects of a big raise.

HORNITOS.—There have of late been some important changes in the mining operations of this section. The Yosemite mine is being worked now, and the mill will start up just as soon as pipe can be laid from El Dorado creek to convey a sufficiency of water to the mill. This necessitates the laying of about 8,000 ft, about 2,000 of which has been laid within the past two days. Pipe-laying will in all probability be finished this week. The mill has undergone an entire change. Since Mr. Mitchell has had charge of the mine it has been worked with better success. Mr. Huling has paid all back due to the old company, and is running the mine on his own responsibility. At present there is some fine ore coming out of the mine. Mr. R. Barcroft has bought out most of the owners in the enterprise mine, and now has 8 men at work upon the mine. I learn that the Quartz Mountain mine has been sold to a New York company. It is the intention of the buyers to build a large mill on the Merced river.

MONO.

BULLION.—*Free Press*, July 30: The first clean-up of the Bechtel was completed at the Noonday mill in the early part of the present week, and the shipment made. It amounted to $33,052.03. The run was of about 3 weeks. This must be considered as exceedingly gratifying, and would seem to fully justify the Bechtel management in the erection of a mill—a project which has been under contemplation for some time. At the same time it will be an encouraging circumstance to state that the bullion shipments from the district from the 1st of January to the 30th of June, the first 6 months of 1881, were $1,600,000. The shipments for the same period in 1880 were $1,400,000, and in 1879 they were $1,100,000. The average of shipments for the first 0 months of this year has been over $266,000 per month. The shipments of this year would amount, in the ratio of those for ths first 0 months, to $3,200,000, which would be about $200,000 more than last year, but we have no hesitancy in expressing the opinion that they will amount to $3,500,000. It will be seen that, notwithstanding the thinning out of population and ths low price of stocks, Bodie is now producing a bettsr average of hullion than ever before.

NEVADA.

VERY ENCOURAGING.—Nevada *Herald:* For two years or more the Cold Spring M. Co. have been pushing ahead their tunnel through hard rock, running in that length of time about 500 ft. Recently the men at work in the mine broke through ths rim rock of the hard ledge of granite and encountered soft rock. This is an encouraging sign and causes the stockholders to feel elated ovsr the prospects of being able to push rapidly forward and reach the gravel channel. During the past two years the average progress per week was about 4 ft. It is believed that as much can be done per day now. Between 500 and 600 ft. have yst to be run before the channsl is reached.

ANOTHER RICH DISCOVERY.—*Transcript*, July 29: A. H. Scott, who has been prospecting for a year or so past in the region of country between Banner Hill and Greenhorn without finding anything worthy of location, has at last been rewarded for his assiduity and perseverance. About a month ago he discovered the croppings of a ledge on the main road south of Banner Hill, below Stiles' goat ranch, and hut a short distance from the school-house. As usual, he commenced sinking a holo and prospecting the ledge. The rock was considerably decomposed, but discovering indications of free gold in it, he concluded to take out a crushing. The deeper he went, the larger and richer became the rock. He has now about 20 tons on the dump pile, which will he crushed by mill process. The ledge is now 4 ft between the walls. Three days ago he took a panful of the decomposed quartz and ores, and on washing it out, got 50 cents to the pan. Gold was plainly visible in the pieces of quartz remaining in the pan, and he is convinced thet fully as much more could be obtained from it. He is now engaged in sacking up the quertz as he takes it out for shipment. The rock upon the dump will not go less than $25 per ton, and it may double that amount, although there is considerable waste dirt in it.

STRIKE IN MT. AUBURN MINE.—Mr. C. K. Kirby, the indefatigable Superintendent of the Mt. Auburn quertz mine, has at last cause to feel happy—that is, if the discovery of a fine chute of ore will make him so. On Friday last, the miners working on the 300 level struck into a fine looking vein of ore, averaging 18 inches in thickness, filled with rich sulphurets and galena. Taking the course of the ledge, Mr. Kirby caused exploration to be made on the 400 level, and here again he was gladdened by the sight of the same fissure, only richer, with the ledge nearly 2 ft thick, going in the direction of the 000 level. Workman are now engaged in drifting on this level, and the indications are thet they are not far from the pey chute. The erection of a mill, which has been on the tapis for some time, is now a foregone conclusion, and it will not be long before a fine one, with all the modern improvements, will be in active operation. The Mt. Auburn is destined to prove a mine of wealth to the persevering owners.

PLACER.

THE MOUNTAIN OATE.—Placer *Times*, July 30: From Charley Uren, who accompanied his father, E. C. Uren, on a surveying trip over to Damascus, we learn that a big strike has been made in the Mountain Gate drift gravel mine. This mine is an old one, having been worked for years, but recently the pay channel gave out. After running along with the tunnel several hundred ft gravel was struck. A shaft was sunk 80 ft deep, when the best paying gravel ever found in the mine was opencd up. The first run after striking the new lead cleaned up $10,000. Last week's run panned out over $2,000. This mine has been bonded for $105,000, but we should judge the 21 shareholders now wish that bond was in the bottom of the sea. From the same source we learn that the Sunny South claim has again been started up with good prospects of a very flattering nature. This claim has been shut down for a few months past.

GOOD QUARTZ PROSPECT.—The quartz ledge recently located by Jas. McIntosh and L. R. Colgrove, in Bear valley, near Towle Bros' saw-mill, makes a better showing each day as it is being prospected. Last week some specimens of ore were brought down and assays made of them which, in each instance, showed plenty of gold. It is estimated the ore will go all the way from $50 to $200 per ton. The ledge, so far as opened, shows a lode of 0 ft in thickness, and has enlarged the further exposed. The owners have sent men up to open up the mine more thoroughly.

THE Baker mine will probably be shut down for the season this week, the water supply having about given out. Only enough water to run 0 out of 24 hours is now in the ditches. This has been one of the best season's work ever made in the Baker. The Liberty Hill hydraulic mine is being worked with much success this season. The season is about over, however, for this year.

THE WESKE MINE.—Placer *Herald*, July 30: We spoke last week of the visit to the Weske mine, near Michigan Bluff. This mine is now owned and run by the Messrs. Muir, and from all accounts is paying well. The old steam works underground for pumping the water and raising the dirt up the incline have been supplanted by water power, which does the work equally well, and which is run at very little expense compared to the cost of running the steam engines. Very much virgin ground remains to be worked, and some of it is certainly very rich. We were shown one breast in this mine where the gravel was so full that the gold was plainly visible to the naked eye, and pieces of the pure gold were mixed among the sand and rocks so thick that the merest novice could soon pick out an assortment of specimens. In some of the small crevices on the bedrock there seemed to be as much gold as gravel.

PLUMAS.

SOUTHERN EUREKA.—Greenville *Bulletin:* Pres. J. B. Scott returned from New York yesterday morning, having been absent six weeks.

THE MINES OF GRANITE BASIN.—The mines of this place are becoming somswhat noted, and capital is seeking investment here. Yesterday several parties arrived from San Francisco who are negotiating for the White and several other ledges, and no doubt a sale will be made in a short time. Mr. Minto is expected to-morrow, and will commence the construction of a 20-stamp mill immediately; the machinery is on the way from San Francisco. Thos. Shannon and others are expected here in a few days to examine, with a view of purchasing, a mine on Grizzly creek. W. Smith Dean had 1½ tons of the gravel from his mine crushed in Emmet's mill, which paid $3 per ton. For so small an amount this is considered big pay, from the fact that from two to three times the quantity can be run through a battery per day than can be run of quartz.

SAN DIEGO.

PINACATE DISTRICT.—Colton *Semi-Tropic:* The Pinecate mining district continues to hold its own. Nsw discoveries are continually being made, and considsrable work being done on the main leads. The San Jacinto mining company are still actively at work, and are developing a fine lot of ore. The walls have spread, and they now have 3 strata of pay ors, making altogether 4 ft of solid pay rock. Indications promise rich developments soon. The mine is now down 100 ft, and drifting is being carried on with vigor. At the depth of 100 ft the rock assays a little over $50 per ton. Thsre is about 300 tons of ore on the dump at this mine, and from careful assays it will run from $50 to $80 per ton. At the Good Hope mine, Messrs. White & Berber are putting in position steam-hoisting works, and carrying on the work of the mine all the time. This mine continues to turn out a fine grade of ore. There will soon be a mill put up for crushing the ore of this mine. Besides the two leading mines, encouraging reports are received from all parts of the district. It is reported that the Mexicans have just made some very rich discoveries in the northern portion of the district, and that the prospectors are actively seeking for pay rock in that section.

SHASTA.

COPPER CITY ITEMS.—*People's Cause*, July 28: From James McGarry, of Copper city, who arrived here yesterday, we learn that the prospects for a bright future for the above named place are very flattering. The Extra Co.'s mill, Potter & Hall, proprietors, is running night and day, turning out bullion to the valus of bstween $750 and $1,000 per day. This le only a 10-stamp mill, and if the company should put in about 20 more stamps, which our informant thinks will probably be done in a short time in the near future, bullion to the velns of about $5,000 will be shipped from Copper city daily. Mr. McGarry informs us that he, together with five others, have taken up an extension to the Northern Light mine, and they have drifted already 180 ft; they have about 75 or 80 ft mors to drift through the solid rock before they can reach the main ledge, and when that is done, they expect to be benefited thereby.

SIERRA.

WOLF CREEK.—*Mountain Messenger*, July 30: Work has been in progress on the Wolf Creek ledge for some time, only a small force working. Some very rich rock is being taken out.

COX & GOURLEY took $50,000 to San Francisco recently ae the result of their season's run.

DOING WELL.—Kendall, Noble, Freese and Boyington are doing well on the North Fork. They had a $150 dividend last week.

THE last two carloads of gravel washed at the B. M. Ex. Co. yielded $83.

MORTAR.—At the Downieville foundry of Taylor & Forbs a flue mortar for the Buttes mine was cast a few days since, weighing 5,300 lbs. It came out in splendid shape, almost as smooth as though planed, and with not a flaw in it.

GOLD BLUFF.—Mr. Vanslyke, principel owner of the Gold Bluff mine, showed us some specimens of his rock this week, in which fine gold in liberal quantities was visible to the naked eye. The ledge upon which he is working is 100 ft wide, and is an entirely new discovery, no rock like it having ever been found in the mine before. Considerable water is encountered, which indicates (to use an expression of which we do not know the exact meaning), thet the "mother lode" has been found. Van deserves the success he is meeting with.

TRINITY.

DEADWOOD RICHNESS.—Trinity *Journal*, July 30: From Deadwood district we hear of several rich discoveries which have recently been made. The McDonald boys struck a quertz vein on the Gibson location, some of which is said to go as high as $15 to the pound. Wm. Lappeu has quartz that goes $1,000 to the ton. Grayson & Co. will have their 10-stamp steam mill in operation by the end of next week

PAIR WELL.—Mr. M. Heimbucher, Supt. of the Altoona Co., in Cinnebar district, informs us that during the past season he prodnced and shipped quicksilver to the value of $5,200, the total expense of such production being only $1,200, and leaving a net profit to the company of $4,000. The Cinnabar was obtained from surface sluicing, 2 stringers being cut during the season.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—Gold Hill *News*, Aug. 1: The joint Union Con. east crosscut on the 2500 level is being repaired and enlarged. At the Sierra Nevada Mexican-Union shaft have placed 2700 station pump in position, and connected the rod; also, casing timbers at the 2300, 2400 and 2500 levels. During the week 320 tons and 600 lbs. of ore have been extracted and sent to the mills.

UNION CON.—On the 2500 level the joint Sierra Nevada east crosscut is being enlarged and repaired. On the 2700 level joint Sierra Nevada east drill hole No. 1, from the station, has been extended 110 ft.

CALIFORNIA.—During the past week 48 tons and 1200 lbs. of ore have been extracted from the 2000 level. On the 2500 level are cutting out a station for the joint Con. Virginia winze.

CALEDONIA.—Pumps have been run on an average of 11 hours per day, consuming an average of 4 and 6-7ths cords of wood per day. Forman shaft has been sunk and timbered 10 ft; total depth, 2,005 ft. The water has increased a little during the week.

CON. VIRGINIA.—The joint Best & Belcher crosscut on the 2300 level has been advanced 19 ft. On the 2500 level are cutting out a station for a joint California winze.

OVERMAN.—The drift on the 2275 level has been extended 53 ft, 30 ft of which required timbering. Forman shaft has been sunk and timbered 15 ft; total depth, 2005 ft. There has been a slight increass of water during the week.

UTAH.—The tank pit for the new pump at the 2350 level is completed, and sinking the incline will be resumed today. The north drift on the 400 level is in 420 ft. Crosscuts will now be run at different points both east and west.

MEXICAN.—Are timbering up the main north lateral drift on the 2700 level.

OPHIR.—In the joint Mexican east winze are cutting out a station on the 2900 level. The joint California east winze on the 2500 level has been sunk and timbered 13 ft. Are repairing ths Burleigh and incline air compressors.

C. N. S. SHAFT.—The east section of the hydraulic pumps is running satisfactorily. The material to repair the west section has not been received from San Francisco

UNION SHAFT.—Have placed pump in position at the 2700 station and connected the rod; also are casing timbers at the 2300, 2400 and 2500 levels.

CON. IMPERIAL.—Doing the usual work on the 200 level and repairing and retimbering drifts on the 2800.

CANDELARIA DISTRICT.

NORTHERN BELLE.—*True Fissure*, July 30: The shaft levels show about the same as last week, and are yielding as usual. The only material change is in the intermediate between the 1st and 2d levels, which has shown an improvement since last report. The levels above the adit are looking well throughout—the 0th and 10th especially presenting a fine appearance. About 85 tons of ore are being extracted and sent to the mills daily. Both mills are running steadily and doing good work. Bullion shipments for the week ending July 27th, amounted to $21,-$91.86; shipments on July account to 27th instant, aggregate $77,008.09.

MOUNT OLABLO.—The north crosscut, from the bottom of ths winze from the 3d level, has been driven 12 ft since last report, and shows a favorable formation in the face. The west drift has advanced 15 ft, and is in promising ground, giving low assays. There is northing worthy of note on the 2d levsl. In a winze bstwsen the 2d and 3d levels there is a good vein of high-grade ore. The stope on the 1st level shows a good body of ore. In the old Mount Diablo tunnel, sdit lsvel, a stope on a small vein is giving some good ore. Shipments of bullion during the week were $6,576.34 on the 22d instant, and $8,110.60 on the 20th.

HOLMES.—The work of preparation on this mine is being vigorously pushed. A line of air-pipe has been put in, which gives a good circulation, and removes the powder smoke much more rapidly. Track laying has been commenced. In a dey or two a car will be put on, and matters about the tunnel will have an assuring appearance.

ACTIVITY.—Esmeralda *Herald*, July 30: Ex-Senator Garrard returned from Sweetwatsr district Wednesday. He informs us that the Great Western claim is developing well, and bids fair to become a fine property. The Comstock and other claims are being worked, and some of them are showing very well for prospects There is considsrable activity in the district, about 30 miners being at work.

EUREKA DISTRICT.

WILL NOT BE CLOSED DOWN.—*Sentinel*, July 30: President Robinson informs the *Sentinel* that ths Albion will go right ahead as usual with the work of development. A force of men will be kspt on dsad work until the meeting of the Supreme Court, after which a large number of miners will be engaged in extracting the rich ore of this great bonanza. It is thought that the Albion will require not less than 300 men in the mine by the 15th of October. The legal obstacles remaining to be overcome have been reduced to a very thin proposition.

SILVER CANYON DISTRICT.

STARTED UP.—Whits Pine *News*, July 30: The mill at Silver canyon was started up last Monday. We are informed that a long run is contemplated. The mines over there are looking first-class, and we shall expect to be able to chronicle regular hullion shipments from there from this on.

ARIZONA.

THE COPPER QUEEN.—*Arizona Mining Journal*, July 30: Tbis well-known and valuable mine has a second furnace now turning out hullion. The new furnace will double the amount of bullion heretofore shipped. During the coming month there will be turned out from that property between 700,000 and 800,000 lbs of copper hullion. The starting up of the new furnace has necessitated the employment of additional men, which has created considerable new life in Bisbee. Everything in and around the camp is looking well.

SAN PEDRO DISTRICT.—The Pioneer mine, owned by Solomon Werner, of Tucson, and others, has a sheft down 00 ft. Fifteen tons of ore was hauled to Tucson, and worked at Warner's quartz mill, returning something over $200 to the ton. This is undoubtedly a valuable property.

SILVER QUEEN MINE.—Main shaft is down 95 ft. There is a good, strong vein of rich ore, and this is, beyond douht, one of the most promising prospects in this section. The owners are now making a ditch to carry water from the Gila river to their mill-site. There is a dump of at least 100 tone of ore at the mine, which is the richest in the district.

THE WALSTON.—Main sheft is down 140 ft. A drift has been run on this level 12 ft on ore. At the 50 level of shaft have crosscut vein 20 ft to foot-wall. This crosscut is all in ore.

SAMPLE MINE.—Owned by Pete Young, Fred Getz and others. Shaft No. 1 is down 100 ft. Shaft No. 2 is now being sunk, out of which very rich ore is being taken.

THREE mines are all situated convenient to wood and water, with a productive farming country within a few miles, where grain, vegetable and other products of the soil are raised in great abundance, giving this district advantages seldom met with in our Territory.

SILVER BELL DISTRICT.—We learn from Mr. A. T. Lea, who has just returned from Silver Bell district, where he has had charge of work for a Pennsylvania company, who own and are developing the Doxology, True Blue and Spring mines, the following particulars relative to work now being done on the above-mentioned mines, as well as some facts about other claims in the same district: On the Doxology, the work consists mostly of openings along the ledge. Eight cuts have been made, each opening showing ore. This work has been done for the purpose of determining where to sink the main working shaft. The ledge has been exposed in the openings, and 800 tons of good ore taken, and is now on the dump. On the west lies the True Blue, following the ledge. There are 200 tons of ore on this dump—yellow and gray carbonate, mixed with chloride. Assays range from $15 to $122. On the Spring mine considerable work has been done, showing a flattering prospect. Twelve men are employed, night and day shifts being run. These mines are situated 40 miles west of Tucson and about 4 miles east of Pelton, lying along the north line of the Young America copper group, purchased some time since by Eastern capitalists from Charley Brown and associates. Considerable work has been done on these mines. Next to these lie the Reardon group of copper mines, bonded to Senator Norwood and associates. Senator Norwood has also an interest in the Bullwhacker. Work is about to be commenced on this latter mine, which is said to make a fine showing as a copper prospect. These mines are on the same mineral belt with the Huachuca smelting company's property, at Pelton. The smelter of this company is now turning out copper bullion every day.

COLORADO.

DIAMOND TUNNEL.—Colorado *Miner*, July 29: The tunnel is now completed 1,650 ft. The working force has been increased to complete the tunnel to the intersection of the Cory City lode and open up its expected bonanzas as soon as possible. In No. 3 and 5 lodes, drifts west are being extended to open further ore bodies. No. 6 lode, east of the tunnel shows 3 to 10 inches of rich ore running from 70 to 400 ounces of silver per ton, and No. 6 lode, west of the tunnel, shows a 12-inch pay vein of low-grade ore which, with stoping, will probably prove as rich as the east ground. No. 8 lode shows a 2-ft pay vein of low-grade ore, but improving in the stope.

DECATUR.—The main points of attraction at the present time for the miners and prospectors of Decatur are the Horseshoe and the head of Chihuahua gulch, where some excellent discoveries have been made and a decided attempt to develop the properties is manifest. It is a disagreeable fact that two of the most prominent and oldest mines of the locality, the Peruvian and Tariff, are dormant.

In company with Gus Williams, one of the solid men of the camp, we made the tour of the Horseshoe on Tuesday morning and saw several highly promising mines. The majority of the properties, however, are mainly prospects, though some of them are remarkably good ones.

IDAHO.

BAY HORSE.—Yankee *Herald*, July 21: The mines of Bay Horse are improving in width and richness under active development, and the output of ore is steadily on the increase, while the general business outlook is much more promising than during the past two seasons. Like most mining camps, every branch of business is overdone, and though it causes considerable grumbling, nothing more could reasonably be expected. As the foremost ore producers of this section, the now famous Ram's Horn mine is making an enviable record. There are 63 men employed in the mine at the present time, and ths force will be steadily increased. Sixty mules make one trip daily from the mine to the smelter, taking from 8½ to 10 tons per day.

MONTANA.

ERECTION OF A SMELTER.—*Inter-Mountain*, July 30: C. T. Meader, president of the Bell Co., arrived yesterday morning from Salt Lake, where he has been for about 2 weeks on business connected with the mine. Mr. Meader's trip was very successful in a financial point of view, and he has already begun to make arrangements for the immediate erection of the smelter for the reduction of Bell ore. This is good news for the stockholders, as it furnishes all needed assurance as to the future success of the company's operations.

LEXINGTON.—Helena *Independent*, July 30: The Lexington mine, of Scratch Gravel district, within about 5 miles of Helena, is to start up in a few weeks under the superintendsnce of H. W. Child. Sufficient capital has been furnished to warrant an amount of development that will probably establish the direction of the lode and its value.

A. M. Wilkinson & Bro. have discovered a lode of excellent promise bstween Wickes & Vaughn's Little Jennie mine, about 2 miles off the road recently built to connect this mine with the Alta Montana Co.'s reduction works. The two locations made are called the Wickyup and Assiniboine. Only a limited amount of work has been done, but the vein seems to be very wide, and samples are found that carry 250 to 2,000 ounces of silver to the ton, besides some gold.

ONE of the branches of McLellen creek is called Crystal creek, and in its vicinity there seems to be a good deal of activity among prospectors. Hill & Co. have named a lode the Shoofly, and from its output run a test at the Guyer mill with a saving of $20 of gold per ton. They have a shaft 20 ft deep, and about 20 inches of the vein carries this kind of pay. About 600 ft north of the Shoofly, and not far from the Uncle Sam, owned by Kimber & Buswell, and from which a test lot was milled with a saving of $15 per ton, a new discovery has been made that shows well for the 2 ft of its width. The Star of Hope is the widest of the lodes discovered in that locality, but many of ths narrow lodes are rich, and it is not unlikely that wide ones will be found carrying the same grade of good pey. The Alice mine, of Cascade gulch, 1½ miles from the Star of Hope, is 2½ ft deep and carries a narrow pey streak of very rich ore. Twelve inches of it will average at least $30 gold per tou, and one mill test nettsd a saving of $35 er ton.

OREGON.

ITEMS.—*Democratic Times*, July 8: S. C. Carter has sold his claim on Squaw creek to a Chinese company. Gold has been found on A. P. Talient's farm on Wagner creek, and it is believed to exist in paying quantities. A neat slug of gold, worth $1,000, was found at Scott's Bar, Cal., recently, in the Mountain View M. Co.'s diggings. Jas. Ralls showed us some quartz taken from the old Winchester ledge in the Willow Springs district, which looks well. A Mr. McKee, of Galleo creek, a pioneer miner, struck some rich diggings last season, taking out several hundred dollars. Jack Leyton is still engaged in piping, but expects to commence cleaning up before long, as water is failing. Wimer & Simmons, of Weldo, are still cleaning up and taking out large quantities of gold dust. They will do even better than they did last year, when they cleaned up over $10,000.

UTAH.

STAR DISTRICT.—Cor. Salt Lake *Tribune*, July 22: The biggest mines in Star, at present writing, are not producers of the highest grade ores, yet in the early days of this now permanent camp, ores of a very high grade were extracted and shipped in considerable quantities to Salt Lake, and for reduction at Shauntie. Some of these ores come from are still being worked and are looking well at a greater depth. I now refer to the Talisman, Ivanhoe, Turk, Little Mint, Hickory, Osceola, Star, Horn Silver (of Star district), Independence, Crœsus and a number of others. A year before the railroad reached this district, Star had a bad set-back on account of the great drop in lead; many of the miners, in fact two-thirds of them, left for other fields and camps. But to-day 3 extensive enterprises have begun. A big working tunnel is being run on the Mammoth mine. A new vertical shaft on the well-known Rebel mine is now down nearly 200 ft. And the Boston mine is being very extensively worked by W. S. Searls. A new patent whim is to be placed upon the Talisman soon. Ores are being steadily shipped to Frisco for reduction. The extension of the Utah Central railway to the south and to the great iron deposits, which are only 40 miles south of Star and Frisco, will furnish cheap flux and manganese for the better reduction of ore. Star district is 15 miles in length and about 10 miles in width, and now shows over 50,000 ft of shafts, tunnels and drifts, not counting prospect holes of 6 or 10 ft in depth. Star district has the longest incline shaft in southern Utah, that in the Wasco mine being 900 ft in length, with ore in the bottom and looking better than ever. And all this work of 50,000 ft has been paid for by the ores extracted therefrom. About 50 men are now working in this district, and now strikes and improvements are reported most every day.

CHRISTY.—Silver Reef *Miner*, July 24: The Christy Co.'s mines continue to yield excellent ore, and everything at mines and mill is running uninterruptedly.

THE CALIFORNIA.—All the stopes and levels look remarkably well. Sinking on the main incline continues, and shows increasing strength with additional depth. Improved hoisting works are in course of erection, and a new 54-inch boiler is expected in a few days, which will be put in position at once. This will greatly facilitate the handling of the mine's product, as well as meet the requirements in sinking the main incline.

THE STORMONT.—Reports from this company's mines are very encouraging, and the manager is quite content with the outlook, which surpasses his previous expectations. As the work of development goes on the promise of permanent and profitable mine increase is apparent on all sidee.

THE BARBER & WALKER.—Work in this mine is progressing steadily, and with very encouraging results. The ore continues to improve in extent and richness as developments progress, and everything looks favorable for the uncovering of larger ore bodies than have heretofore been encountered in the mine. The old workings have undergone a thorough retimbering at different places, and several good ore faces are now exposed therein. The property is being worked in a systematic manner, and is supplying the mill to its full capacity. A winze is being driven to connect the 3d and 4th levels north, and is going through some good ore. This will no doubt show up a valuable block of ground between these levels. The mill is in good condition, and can be relied on for regular shipments in the future. The company have resumed bullon shipments, and shipped one bar yesterday and one to-day, aggregating $3,500.

A YOUNG man named Hugh McSorley fell 90 ft. down a shaft of the Gleeson mine, Calaveras county, and, falling in the water of the sump, was not injured materially.

California Wheat-Shipping Points.

The address of the retiring President of the S. F. Produce exchange brings forward prominently the fact which all acquainted with the subject have noted, and that is the movement of wheat shipping away from San Francisco and toward other points here and there around the bay. We have been prone to consider this tendency a good one on the whole, not that we love San Francisco less, but the State more, and we like the building up of business points as near to the productive fields as possible. Thus when the ships can be laden in the Carquinez straits and taken thence to Liverpool for less than the same could be handled and sent forward from San Francisco, why should the wheat grower pay the cost of rolling his grain 40 miles or so farther? There is evidently no reason why he should, for he is ceasing to do it. Last year San Francisco lost a good part of the wheat because of storage and ship loading at Port Costa and vicinity, and this year the tendency toward loading in the upper bay will be still more apparent.

President Clayton, in his address, gave the figures of loadings, for the last three harvest years, as follows:

	1878-79.	1879-80.	1880-81.
San Francisco, ships	148	110	103
Oakland	62	37	33
Vallejo	65	18	97
Benicia	—	—	31
Martinez	—	—	1
Port Costa	—	—	84
Totals	275	285	349

In relation to the subject, President Clayton says it will be observed that with a great increase of tonnage the number of vessels loaded in San Francisco has actually decreased, until now we do not handle at our wharves even 30% of the grain shipped to Europe. This, too, in the face of the attempt made by the Harbor Commissioners to facilitate the handling of the grain here through the construction of the grain sheds on the sea wall. The freedom from wharf charges at Port Costa, Vallejo, Benecia and Martinez, is more than an offset for the extra charges for towing. If the transfer of so great an amount of business to other points is owing to natural advantages, the citizens of San Francisco have no cause for complaint; but if this is caused by the limited jurisdiction of the Harbor Commissioners, this limitation amounts to a direct discrimination against this city.

It is certain that San Francisco cannot complain justly. For a long time ships loading here have been submitted to expenses almost amounting to extortion, and it is little wonder that the victims will fly elsewhere just as soon as the opportunity offers. It is only fortunate that such an escape was possible. Now, there are other expenses which should be considerably lightened up, and there will not be so much reason to put up charters to the disadvantage of the grain growers as there is at present.

In connection with mention of the meeting of the Produce Exchange, the *Bulletin* recalls some general facts on the shipment of California wheat, which are valuable from a historic point of view, and should be preserved for reference. It is shown that it is now nearly 13 years since the first wheat ship was loaded with California wheat away from San Francisco. This was the *Daniel Marcy*, which took her cargo aboard at South Vallejo in September, 1868. There were four ships loaded during that cereal year at the same point. The completion of the railroad from Sacramento to Vallejo made the above movement possible at that time, and the operation of that and other roads has contributed to the same end ever since. It was not until August, 1870, that Oakland Point was made a place for the loading of wheat ships. These two points have been the only real rivals to San Francisco in the loading of wheat ships until last year, when Port Costa and Benicia were made available by the ferry introduced between these points by the Central Pacific Railroad Company to accommodate the overland trains. The annexed table gives the localities of wheat loading for the past 13 years:

Years.	San F.	Oakl'd.	S.Val.	Misc's.	Total
1868-69	171	—	4	—	175
1869-70	163	—	31	—	194
1870-71	71	16	36	—	123
1871-72	24	12	7	—	43
1872-73	189	106	44	—	339
1873-74	94	77	76	—	247
1874-75	116	82	63	4	265
1875-76	75	35	64	—	174
1876-77	114	85	103	5	307
1877-78	58	14	37	—	109
1878-79	142	62	65	—	269
1879-80	118	37	118	—	273
1880-81	103	33	97	124	357
Totals	1,438	559	745	133	2,875

The miscellaneous column above for 1880-81 includes the 84 ships at Port Costa, 31 at Benicia, and several at Wilmington, Los Angeles county.

WOOD PAPER.—The *Paper World* mentions a new article for covering walls, called wood paper. In this paper is given a thin veneer of the wood desired, and can be rolled up like ordinary paper. This paper, properly applied, gives the walls of a room all the appearance of being worked in hard wood.

SAYS an exchange: It would be a good thing for the mining press of the country to hear in mind that every puff of worthless property, and every endorsement of a rotten company is a stab at the legitimate mining industry of the country.

The New Mexican Turquoise Mine.

From a letter to the New Mexican *Mining News* we extract the following, telling as it does, evidently, the true story of that turquoise mine:

Carbonateville, or Turquesa, is located at the north end of a gulch running north and south, about five miles south of Bonanza and four miles north of Cerrillos. It has a population of nearly 200. The view from the southward is most magnificent. The Sandia mountains, 40 miles distant, are readily seen by the naked eye from this village. The village is well supplied with hotel accommodations.

Messrs. Frank Dimmick and Robert Hart were the first settlers of Carbonateville. They came here in 1879 and located quite a number of claims in February of that year. They also opened up the Carbonate mine in the same year. It is on the town site and is down 134 ft. It is not now worked.

This is a quiet, peaceful mining camp. Two good assayers are permanently located here and as they are reliable men, confidence can be placed in their statements.

A few words about the celebrated turquoise mines. As they have been written up so graphically within the last 25 years by some of the ablest writers of the age, I approach the subject with hesitation. I will try, however, to give a few additional facts as I find them. The work on these mines, as is well known, was discontinued in 1860, and was resumed again about a year ago. The patentee of the land, as near as can be ascertained here, is Mr. Enos Andrews, of Santa Fe. In the spring of 1880 a party of New York capitalists located a claim on this mine under the United States mining laws, and have expended a number of thousand dollars in sinking shafts, making tunnels, etc. Work is now stopped, and, as I was informed yesterday by one of the gentlemen who have made the improvements, no more work will be done in the near future, at least, as every dollar expended has been a loss to the company. A large quantity of this turquoise, the best quality taken out by this company, was taken by one of the proprietors to one of the best jewelers of New York city, for an appraisement of its value. This jeweler pronounced it of *no value whatever*. The turquoise stones were left there with the jewelers to sell, but not one cent has ever been received by the company from them. For ages to come fabulous stories of the immense wealth mined from this great natural storehouse of turquoise will be told and believed throughout the civilized world, and yet the facts are that the stone recently taken from this mine has no commercial value. I visited these mines, and the above statement, coming from the owners of the mine, can be relied upon.

Buy New Mines.

In one of our late exchanges the principle is laid down that it is safer and cheaper to invest in a new property than in a nearly exhausted mine, even though it be paying dividends. The principle is such a sound one, and has been so often verified that it scarcely would seem to need comment; and still there are people whose sole idea of a profitable investment is something that pays at once. If it had had any weight with Mackey and Flood and others on the Comstock and in different parts of Nevada and California, the bullion product of the last decade would have been a mere bagatelle beside what it has been. They reached a depth of 1,200 ft. in the Con. Virginia, and 1,300 ft. on the California, before dividends were in order, and then the fearful began to buy, and continued to buy until the last dividend was paid and assessments were called for. Take almost any dividend paying mine you chose, and multiply the number of shares by the value per share, and the price is fabulous. Take the Nevada mines that have paid the most dividends, and they are the heaviest tax upon their owners to-day. The men (this is our point) who were in them early, and staid with them, made the money, and the latest investors only got a legacy of assessments. The moral is obvious, buy good prospects at moderate prices, develop them intelligently and economically, and your chances of making money are far greater than if you bought into a played out dividend paying mine.—*Silver Belt.*

AN EXPERT'S EXPERIENCE.—A mining expert recently went down the shaft of a mine in the Tombstone district of Arizona, which has not been worked for several months. His trip was evidently anything but pleasant, for he had scarce struck the bottom before he shouted to the man at the windlass to hoist. When he reached the surface he said, in answer to the anxious inquiries: "Why, there—are about—17 rattlesnakes—52 horned toads—a thousand rats—and half a dozen of the d—dest Gila monsters you ever saw—I wouldn't give a cuss—for the mine—except as a side-show—or a menagerie—it's worth a hundred thousand dollars for that—a regular bonanza."

THE Nevada *Daily Transcript* says that the new mill of the Rising Sun quartz mine at Colfax is completed, and is doing good work. The new shaft is down 118 ft. and the superintendent says it has the same vein continuously followed from the main shaft; at the present depth the pay vein having widened out two ft.

Curious Ore.

The *Tribune* reporter the other day dropped into the Utah sampling mill, where he was shown by the proprietor a lot of 10,000 lbs. of ore, recently brought in by Hon. R. B. Vivian, of Bozsman, Montana. The ore is from near Bannock, and will run well, probably over $800 to the ton. It is curious looking stuff, and Mr. Conklin confessed that he didn't know what to make of it, but it was probably very good. One heavy specimen was brought in boxed, and had just been opened. It weighed 123 lbs.

"Speaking of curious ore," said Mr. Conklin, "this is the worst deception I ever saw;" and he pulled a couple of small specimens from his pocket, which seemed to contain nothing but iron pyrites.

He then went on to say that nine men out of ten would pronounce that ore worthless. It came from a mine in the vicinity of the Grand Prize, and where a box of it, weighing 180 lbs., was brought to the mill. He was inclined to laugh at it, and intimated that it would not pay the expenses of sampling. The party, however, was willing to run the risk, and as Mr. Conklin said, a man may have brick-bats sampled if it is his notion, and he wants to pay for it. So he took that particular job himself, and to his astonishment it run $5,000 to the ton. He has since assayed several lots from the same vicinity, and it will average from $2,500 to $3,000. The specimens have been shown to several experts, every one of whom have pronounced them worthless, and could hardly be made to believe otherwise.

A Montana Smelter.

The Parrot smelter, built last winter, could not be possibly started up until this week, owing to the protracted delay in the arrival of the machinery and fire brick. Everything is in readiness, now, however, and under the skillful management of Mr. Migeon, a long and successful run is anticipated. The furnaces have a capacity for reducing between 12 and 15 tons of ore daily, the metal product of which will be three or four tons, according to the percentage of copper contained in the ore. The first matte will be run out on Saturday.

A very large amount of copper ore is already extracted from the mine and is available for immediate reduction. The main shaft has attained a depth of 80 ft., but there being an abundance of ore on the dump and in the upper workings of the mine, a cross-cut to the vein will not be extended until a depth of 180 ft. shall be reached. The new shaft-house, 50x20, with workshop additions is now completed, and according to a letter received this morning from B. F. White, the hoisting machinery recently ordered, will arrive in Butte to-morrow. The operations of the Parrot company, which is one of the wealthiest concerns in the Territory, may now be considered fully under headway. The Butte boom has received another impetus. —*Inter-Mountain.*

BRITISH COLUMBIA GOLD BEACHES.—Considerable interest was excited a few weeks ago by the return of Mr. Jenson from Cape Commerell, at the northern end of Vancouver Island, bearing with him a large quantity of black sand, which he had gathered on the beach and the bluff facing it. This sand has been submitted to rude tests, and gold has been found among it. In general appearance the sand resembles that obtained at Gold Bluff, off the California coast, where the deposits have been worked for many years with much profit. Black sand would seem to be characteristic of many localities along the Pacific coast, and its existence is variously attributed to the presence of veins of decaying quartz on the ocean bed, from which the sand and gold are freed by the action of the waves and thrown upon the beach. Far beyond Cape Commerell, away up in the frozen Alaskan regions, black sand is found. A party who recently arrived at Sitka brought a sack-ful of the sand which they obtained on the beach many miles north of the Aleutian Islands. At some not very remote day the deposits will be thoroughly examined and their importance determined. Our opinion is that they possess great value, and that the time will come when the black sand of this island will be considered of as much importance as its black diamonds.—*British Colonist.*

MEANING OF "SHASTA."—We copy, says the Shasta *Courier*, the following from the first number of the Shasta *Republican*, published October 20, 1855: The word Shasta is derived from the Russian language. Many years ago, and among the first travelers who visited this portion of the Pacific coast, was a party of Russians who passed through California, going from the north to the south. They gave a name to many of the more prominent landmarks which they encountered in their journey. To the peak now called Shasta Butte, a mountain clothed with eternal snow, and the highest in California, they gave the name of "Tcheste," signifying chaste, pure. Subsequently travelers and geographers changed the name to "Tchasta," which was again changed, after the discovery of gold, to the present word "Shasta." When the counties of the State were first organized, Shasta Butte was in Shasta county. Afterward a new county was formed (Siskiyou) which embraces this lofty mountain within its boundaries.

The Alice gold and silver mine in Montana paid its fifth dividend of $40,000 in New York on the 15th.

The Demand for Labor.

There could hardly be any surer indication of the life now inciting the industries of the United States than the demand for labor, which seems to greatly exceed the supply notwithstanding the unparalleled immigration from the laboring classes of Europe. The country is growing and advancing from side to side and end to end, and all who have the disposition to labor, can secure the opportunity. This is in marked contrast to the condition of affairs three years ago, and it shows that the era of depression, born of the extravagance of war times, has passed away. The people were forced to return to something like the old-time economies and thrift, and the result came more quickly than anyone thought, in the reawakening of the nobler industries and the general prosperity secured thereby. How long the present era will endure no one can tell; but unless it should proceed into one of undue expansion and extravagant outlay, there is no reason to anticipate anything but a steady growth and development of the country, in accordance with its wealth of resources and manifest destiny.

As an indication of the demand for labor, which we have cited as a sign of productive vigor, nothing can be more emphatic than the condition of affairs at the great headquarters of immigrants at New York city. A dispatch thence last Friday is as follows:

An unusually large crowd of immigrants swarmed Castle Garden yesterday. An increasing number of applications for help are being received in the Labor Department from all parts of the country. Servants and workingmen are in pressing demand. In fact, it was impossible to supply the wants of the country. For the six months ending July 1st, 19,000 men and 5,000 women were sent away from the Labor Bureau of Castle Garden to different parts of the United States. The Fruit Growers' Association of Sumner county, Florida, sent a communication asking for able-bodied workingmen to be forwarded to them immediately to work in the orange groves and gardens of that county. Similar letters were received from other parts of the South and West. Fifty immigrants were sent to the Kansas City Smelting Works in Missouri. Fifty more are expected to leave to-day to work on the Texas-Pacific railway, where they are to have $1.50 a day for two months, and then to receive the usual wages of the region. Out of their first installment of wages $3.50 is to be deducted for the expense of transporting them to Texas. The Superintendent of the Labor Bureau says that he has stopped answering letters asking for labor, as it is impossible to fill the orders. There are applications on file now for more than 500 house servants, and for any amount of female factory hands to go South, where it is said that hands can make from $2 to $3 per week in the factories.

In our own State, there is a good demand for labor, and the ranks of the unemployed have become exceedingly thin. It is, however, just at present the harvest season, both in grain field and orchard, and there is usually plenty to do for all who have the disposition to earn their bread. The true test of the condition of labor demand and supply here will come later in the year. We expect there will be more chance this fall to secure a hiring for the winter than there has been heretofore, and the city crowds will be smaller and the strolling beggars fewer. There are now so many progressive enterprises under way, both in agriculture and in manufacturing, that the call for trustworthy hands will be certain. It is true that there are many Chinamen now arriving, but as there is apparently more for the Caucasian to do, there is little complaint being made. It is difficult to see how the present fruit crop, which is bringing such fine prices, or the immense grape crop now ripening, could be handled at all without Celestial aid.

SILVER IN SANDSTONE.—John Murphy, a prospector, arrived in Butte several days ago from the Yellowstone country, bringing with him some specimens of what he claims is silver-bearing sandstone, a ledge of which he discovered in the Crazy mountains, in the vicinity of Mammoth Hot springs. The ore is identical in appearance with that produced from the sandstone reefs of southern Utah. Scientists for a long time ridiculed the idea of sandstone carrying silver, but the notion has been dissipated by the results of mining operations in Silver Reef. Mr. Murphy is quite sanguine of having struck a bonanza; and though the surface rock, which has been assayed in Butte, shows but a small value in silver, he is quite confident that the development of his claim will result in the discovery of paying ore bodies. He will return to the scene of his discovery in a few days.—*Inter-Mountain* (Montana).

OPINIONS AS EVIDENCE.—All persons do not sufficiently comprehend the difference between an opinion and a fact. This is especially true of mechanics, who are sometimes apt to put one forward in lieu of the other. One man says, for instance, that in his experience cast iron cannot be soldered, and when asked how he knows this to be correct, answers, that he has tried it and failed, and therefore knows that it cannot be done. This is merely an opinion, not a fact, because cast iron can be soldered as well as any other metal. By giving opinions or personal experiences as facts, many errors are perpetuated, for the reason that in making experiments, many persons omit important processes, without which, failure is certain.

MINE and prospect owners should guard against men who come West for the purpose of putting a small amount of money into mining property, taking a controlling interest, and locking the property up—too stingy and void of confidence to develop and improve the property. Such men do more to retard the progress of new mining camps than all the Indian scares and snowstorms of one year.—*Albuquerque Journal.*

The Engineer.

Bold Engineering.

The high and almost perpendicular banks nf the Hudson river, near Cornwall, is at this time daily swarming with men, clinging like lizards to the face of the rock, and working 75 ft. above the surface of the water. Here and there are laborers hanging (for the foothold they obtain is hardly worthy of the name) by ropes fastened many feet above their heads, and circling their waists. As a steamer was recently passing this point, the passengers gazed in amazement at the singular spectacle; and when one of the men, turning toward tho steamboat, waved his hand, cheered, and, falling off, swung for a moment, and then, getting his feet to their former place on the rock, renewed his work at cutting into its face, the spectators from the river sent back an answering cheer, as the boat swept around the point that hid the workmen from their sight, and left them discussing what they had just seen.

These men are employed hy the Ontario and Western railroad company, constructing the new North River railroad, which is to run from Jersey City to Cornwall, and thence west to Middletown. The country through which it passes is so rocky and mountainous that much of the work has to be done by blasting, and this is especially the case between West Point and Cornwall. At West Point, a tunnel 150 ft. deep and 500 ft. long, has been cut through Target hill, and many other bores, nearly as extensive, have been made. But the point already mentioned, near Cornwall, presented, perhaps, the greatest difficulties to the engineers and contractors. About 80 men are employed there, and they are selected on account of their activity and freedom from nervousness. The workmen are for the most part Italians, who are considered best adapted to this peculiar work, not only because they are lithe, light and active, but on account of their ability to endure the fierce heat that beats down on the exposed face of the rock.

New Form of Plates for Iron Clads.—At a recent meeting of the Engineers Club of Philadelphia, Prof. M. L. Haupt read a paper describing a system of deflecting armor for seacoast defence, designed hy Mr. N. B. Clark, Past Assistant Engineer United States Navy. The inventor's improvements are based upon the fact that it is much simpler to resist the effect of a projectile hy deflecting it than by opposing it by thick masses of inert matter, as is evinced by the "ricocheting" of a shot upon the water. He protects all the vital parts of the vessel by an iron shield, convex upward, placed below the water-line, and so curved that a shot cannot strike point blank. It is claimed that hy this means a great economy is effected in the weight of metal required for attack and defence; the vessel is more readily handled, more seaworthy, and is invulnerable. The principle may he applied equally well to the construction of batteries for defence on shore.

A Novel Project.—It is no new thing to transport fluids, gases and even solids hy means of tubes, pneumatic or otherwise; but now it is proposed to pass human beings through tubes from one point to another, but not exactly in the same way as fluids and gases or letters are passed through. Mr. Bradley Leslie, the engineer of the East India railway company, proposes to travel into France through a steel tube submerged 40 ft. below the surface of the water. The tube would he so ballasted as to make it weigh 1¼ tons to the foot less than the water displaced, its buoyancy being counterbalanced by moorings at every 250 ft. At the shore ends it would be laid in dredged or excavated channels, and would he made to rise from the mid-channel depths hy easy gradients. The cost of carrying out this scheme is estimated at $40,000,000.

Swiss engineers have employed the principle, found so useful in coal mines—of drawing up empty cars by the superior weight of loaded cars descending the incline—on a passenger railway at Brienz. From the landing at that place to the plateau at the top of the falls of the Geisshach the road is furnished with two coaches attached to an endless steel rope. In place of an engine to drive this cable, a tank is attached to each coach, to he filled with water at the top, and emptied at the hottom, thus ascending empty and descending loaded. Thus the force of inertia that carries one coach down causes the other to go up. Instead of a double track, a single track with an automatic turnout in the middle is employed.

Scientific Engineering.—A curious fact and one showing the value and percision of modern engineering may bo mentioned in connection with the recent picking up of one of the Atlantic cables, which became useless some 10 years ago, and which has since been lying neglected on the hottom of the Atlantic at a depth of some 2,000 fathoms. The location of the fault, with so much exactness, and the small expense of picking up and repairing the cables at a slight comparative cost, gives additional value to ocean telegraph property, and increased confidence in that scientific engineering which is able to calculate so closely into such hidden mysteries.

Useful Information.

A Diamond Tester.—A correspondent of the Rocky Mountain *News* tells of an amusing incident that occurred lately on a train that was crossing the Rocky mountains: A traveling peddler undertook, in the cars, to sell a large "diamond" ring to a miner who had made his pile. "Humph," said the miner, after critically examining the ring, "they've got common stone up in tho diggings where I've been that'll cut that diamond all to pieces." "If you'll find a piece of stone that will cut that diamond, I'll give it to you," replied the peddler. "All right," said the miner, "if I can't cut that 'diamond' with a stone I'll buy it of you." Thereupon the miner took the ring in his hand, and pulled from his pocket a small piece of brown-looking stone, similar to a bit of brown free-stone, except the grain was very fine, and with this he proceeded coolly to cut and scratch the "diamond" with several ugly-looking gashes. A group of passengers that had gathered about the miner were amazed, but, while they smiled, the peddler with the "diamond" withdrew discomfited. "That little piece of brown stone," explained the miner, "is a piece of corundum that I got in the Rocky mountains, and it's the best diamond tester in the world. It won't scar a genuine diamond, but it will everlastingly cut up pieces of glass or quartz."

Bagging for Chemicals.—A patent has been taken out for making bagging which resists chemical action. The bagging is plunged in the following solution at 60° C. (142° F.) and left for an hour. Sulphate of alumina, 1 kilometer; water, 25 liters; borate of lime, 1 kilometer. The borate of lime is added after the sulphate of alumina has dissolved in the boiling water, and the whole decanted when settled. After taking out of this bath, the textiles are put in a second bath composed of 1 kilometer of resinous soap and 1 kilometer of Marseilles soap, dissolved in 25 liters of water and carried to the boiling point. At the end of ten minutes the cloths are allowed to drip, and dried, and then re-washed and dried. Bagging made in this way will, it is claimed, resist the action of any acids or chemicals put into them.—*Druggists' Circular.*

Imitation Amber.—Considerable quantities of beautiful objects of artificial amber are now being produced in Vienna. The substance employed in its manufacture is chiefly colophony or resin, obtained by decomposition of turpentine, though several other ingredients are used to give it the requisite qualities. The imitation is said to be perfect, and the production has even the electric properties of true amber. Ingenious manufacturers have even introduced into the substance foreign bodies, insects, etc., to make the similarity more striking. Natural amber requires a temperature of 285 deg. to 287 deg. C. to fuse it, while the imitation becomes liquid at a much lower temperature.

Waterproof Cement.—For a waterproof cement, the following has been given: Boil one lb. of best glue in two quarts skimmed milk instead of water. This will he proof against damp or moisture. Another good cement for this purpose is made by boiling a pound in weight of linseed oil, stirring in quicklime till a good thickness, then pour out on a flat slab or tin plate, keeping in the shade; the cakes will become hard, and are easily melted like common glue.

To Clean Smoky Walls.—Brush them with a broom, then wash them over with strong pearlash water, and immediately rinse them with clean water before the pearlash is dry. When dry, give the walls a thin coat of freshly-slacked lime, containing a liberal proportion of alum dissolved in hot water. Finish with whiting and good size. Be careful not to apply the size distemper till the lime-wash is dry, as the latter will destroy the strength of the size, if the two come in contact while wet.

Cement for Gutta-Percha.—To make a cement for joining gutta-percha belts, the following has been given: Melt two parts of common black pitch to one part of gutta-percha. Make ready the two ends of belt to be joined; heat them by holding a red hot iron over them; then smear both ends with the hot cement; stick them together and apply a heavy pressure for several hours.

For Kindling.—Pine cones are said to he very generally used in Europe for kindling coal fires. When dry, they are readily ignited with a match, and are free from dust and insects. Two of them are enough to start a fire of wood, and a handfull suffices to start a coal fire. The hint might be made useful where bituminous coal is the common fuel and pine cones are abundant.

Reviving Inventions.—Says an Eastern paper, there are in the archives of the Patent Office thousands of applications which have been allowed, but on which the final Government fee has not been paid. The business prosperity of the country seems to have had the effect of starting many of these to life, and now more or less of them are daily being put into the issue.

A piece of zinc placed on the live coals in a hot stove will effectually clean out a stovepipe, the vapors produced carrying off soot by chemical decomposition.

Oil of Coffee.—Dr. C. O. Cech, of St. Petershurg, obtained this article by the following process: He pounded up 50 lbs. of different kinds of coffee in a mortar, and then treated it with alcohol and ether, obtaining about 1.2 grams (2½ lbs.) of oil of coffee. The beans extracted hy him were not of equal value as regards the yield of oil, for while some contained as high as 13%, other kinds fell below 8 . The oil of coffee obtained was a thick, green, transparent oil, and after some time a few long needle-shaped crystals were deposited from it. These proved to he caffeine. Since caffeine is not extracted from the exhausted beans by ether, and very little of it is taken up by the alcohol employed, the coffee from which the oil has been extracted could be employed for the manufacture of caffeine. The coffee oil became turbid in half a year, although it was kept in hermetically closed bottles. Small groups of crystals were formed in the middle of the liquid, and slowly settled to the bottom, and at the end of three years the bottle was two-thirds full of a dirty mass of crystals, consisting of the solid fatty acids, but the upper layer of the liquid remained for years transparent clear, and of a beautiful green color, proving that a portion of coffee oil consists of liquid oleic acid. The percentage of composition has not yet been defined.

Paper Plates.—The latest application of paper is tho adoption of paper plates by some of the great restaurants in Berlin, Germany. The innovation was first introduced during the summer of last year by the adventurous landlord of a much-frequented open-air restaurant. Every customer who ordered bread and hatter, rolls, cakes, buns, or similar articles, had them served to him upon a paper plate, made of a light *papier mache*, adorned with a pretty border in relief, and having at a first glance a great similarity to porcelain. Guests; waiters, and hosts were all pleased with the novelty; it saved the waiters many a deduction from their wages on account of breakages, which the deftest and cleverest of *Kellners* can scarcely avoid when he handles hundreds of pieces of crockery during a single afternoon and evening. The paper plates were so cheap that the landlord did not care to assert his ownership over them, and his customers were allowed to carry them away, like the pretty *serviettes* of thin paper used in so many restaurants in Holland. There was also a considerable saving of the time lost, and the chances of accident incurred, in the cleansing of the earthenware pottery. The success of the experiment has been so marked that the new species of plates is likely to he introduced into a great number of restaurants.

Good Health.

Finger Nails.

Our finger nails grow out about three times a year; they should he trimmed with scissors once a week, not so close as to leave no room for the dirt to gather, for then they do not protect the ends of the fingers, as was designed by nature; besides, if trimmed too close at the corners, there is danger of their growing into the flesh, causing inconvenience, and sometimes great pain. The collections under the ends of the nails should not he removed by anything harder than a brush or a soft piece of wood; nor should the nails be scraped with a penknife or other metallic substance, as it destroys the delicsey of their structure and will at length give them an unnatural thickness. We are not favorably impressed as to the cleanliness of a person who keeps his nails trimmed to the quick, as it is often done to prevent dirt gathering there; whereas, if a margin were allowed, it would be an index to the cleanliness of the hands, from which the collections under the finger nails are made. Leave a margin, then, and the moment you observe that these collections need removal, you may know that the hands need washing, when they and the nails are both cleaned together.

Most persons are familiar with those troublesome hits of skin which loosen at the root of the finger nails; it is caused by the skin adhering to the nail, which, growing outward, drags the skin along with it, stretching it until one end gives way. To prevent this, the skin should be loosened from the nail once a week, not with a knife or scissors, but with something blunt, such as the end of an ivory paper cutter; this is best done after soaking the fingers in warm water, then pushing the skin back gently and slowly; the white specks on the nails are made hy scraping the nail with a knife at a point where it emerges from the skin.

Biting off the finger nails is an uncleanly practice, for thus the unsightly collections at the ends are kept eaten clean! Children may be broken of such a filthy habit by causing them to dip the ends of their fingers several times a day in wormwood hitters, without letting them know the object; if this is not sufficient, cause them to wear caps on each finger until the practice is discontinued.—*Hall's Journal of Health.*

How to take Quinine.—Half a grain of quinine in two ounces of milk produces no disagreeable taste in the month, and this same quantity (half a grain) in a glassful of milk is scarcely perceptible. This is an easy method of administering quinine to children and delicate patients who object to the hitter taste which it leaves in the mouth,

The Feeding-Bottle and its Dangers.—The newly-formed Paris Municipal Laboratory has to justify its existence, and will no doubt do so if it can establish the truth of the facts stated in the following paragraph. Some feeding-bottles having a fetid odor were lately brought hy Dr. Du Mesnil from a *creche* to the Paris Municipal Laboratory for examination. M. Fauvel found that the milk remaining in all smelt badly, was acid, and half coagulated; the globules were deformed, and numerous very lively bacteria, along with some vibrions, were present. On cutting open the caoutchouc tube throughout its length, coagulated milk with small organisms was met with; but a still more important fact was the presence in the nipple of a mass of vegetation of cryptogamic nature. Sown in whey, this developed considerably in a few days. A visitation of all the *creches* was arranged hy the police and medical authorities, and the following was the result: Of 31 feeding hottles examined in 10 *creches*, 28 contained, in the nipple, the caoutchouc tube, and in some cases in the glass bottle, vegetations of the kind indicated, as well as hacteria, etc. Several that had been washed carefully, and were considered ready for use, still contained these cryptogams. Two feeding-hottles in a very bad state were found to contain pus and blood corpuscles; the children who had used them had injuries in the cavity of the mouth. It is thus probable that saliva enters the feeding-bottle, and its ferments are added to those of the milk. The acidity of the milk is attributed hy M. Fauvel to the bacteria present. If further investigation proves that the observations above recorded are generally accurate, it will be desirable to recommend the frequent use of Condy's fluid, or some such agent, wherewith to wash out the bottles and tubes.—*Chemist and Druggist.*

Some New Facts about Rabies.—It is known that M. Pasteur is directing his attention to the subject of rabies. The virus of that disorder, of course, exists in the saliva, but M. Pastour has now proved that it does not exist there only. The brain substance also contains it, and, used to inoculate healthy animals, will reproduce the disease as effectively as the saliva. Matter from the medulla oblongata and the frontal portion of one of the brain hemispheres and the liquid of the brain have been thus employed with success. Again, one of the greatest difficulties in researches on rabies arises from the uncertainty of development of the evil after inoculation or a hite, and the long time of incubation. M. Pasteur is now able to communicate the disease surely, and to shorten considerably the time of incubation. His method is to inoculate directly the surface of the brain, having recourse to trepanation, and using as inoculating matter the cerebral substance of a mad dog as pure as possible. In that case the first symptoms of rabies appear infallibly in a week or two, and death ensues in less than three weeks. In these researches, of which we may expect to hear more shortly, M. Pasteur has the co-operation of MM. Chamberland, Roux and Thuillier.

Relation of the Nose to the Face.—A somewhat singular fact has been observed with reference to the shape of the nose, or rather the setting of it in the face, so to speak. To be strictly correct, from the artist's point of view, the nose should be accurately in the middle of the face, and at right angles with a line from the pupil of one eye to that of the other. As a matter of fact, it is rarely or never thus placed; it is almost invariably a little out of the "square," and the fact of its being so is often that which lends a peculiar expression and piquancy to the face. A medical writer points out that there are anatomical reasons why a slight deviation from the true central line may be expected, and that the nose which is thus accurately straight between the two eyes may after all be considered an abnormal one; the only absolutely true and correct organ being, in fact, that which deviates a little to the right or left.

The Eucalyptus as a House Plant.—Prof. J. L. Budd thinks the Eucalyptus Globulus, which has done such wonders in arresting malarial disease on the fatal Roman Campagna and in other places, acts not only by the immence transpiration from its leaves, which soon distil the juices of the soil, but from actual antiseptic emanations, and by the absorption of deleterious gases. Wounds are healed, and foul sores purified hy an application of the leaves. He advises their growth as a house plant, and says that a plant of his in an eight-inch pot, three years from the seed, remains at about five ft. without losing its large, handsome leaves.

Killed by a Spider.—On Tuesday of last week, says the Boston *Post*, of a recent date, Chas. H. Jellison, son of Frederick Jellison, of Biddeford, Me., was bitten by a black spider, from the effects of which he died. On Tuesday morning, when the boy came out of his room, he informed his mother a spider had bitten him. But little notice was taken of the bite, which was just over one of his eyes. It commenced to swell, and Friday they called a physician. At this time the boy's face was very much swollen; he was delirious, and his pulse had arisen to 160. He died on Monday morning.

The horn of a rhinoceros, when cut through the middle, is said to exhibit on each side the rude figure of a man, the outlines being marked by small white strokes.

Passing Events.

The local event of the week has been the opening of the Mechanics' Institute exhibition of this city, which, as we now write, is in full progress. It is too early for us to have any extended description of the features of the exposition, but as it will continue open several weeks, we shall have ample time to do so. Suffice it to say for the present that the exhibition shows every evidence of being the most successful ever given by the Institute.

Our readers will find on the first page, a very valuable map of the Wood River section of Idaho, engraved specially for the PRESS. With it is a well written and comprehensive descriptive article written by the special correspondent we have sent over there to gain facts for us.

The Miners' Association of California have this week issued an address to the public (which we give in full in this number), showing up in a clear and dispassionate manner the position of the miners in the debris controversy. It is a perfectly plain and truthful statement, and worthy of perusal by all fair-minded men, to whom we commend it. At the same time we must compliment the directors of the Association for its candid and dispassionate tone.

This may be called the era of railroad building on this side of the continent. Both north and south of us roads are being surveyed, laid out and built, and ere many years there will be an immense tract of new country opened for settlement.

A FORCE of 6 men started work on the Keystone copper mine, Copperopolis, two weeks ago, but they have been discharged and work stopped for the present.

Ratio of Accidents and Production in Mines.

There is a certain ratio between the amount of ore raised in the mines and the number of men employed. In this country we do not keep these statistics accurately, but in England where they have government inspectors of mines whose duty it is to report all such things, they are kept carefully. The reports of these inspectors have just been published. By this statement it appears that on the average, in 1880, in Great Britain and Ireland, there was at all the mines under the Coal Mines Regulation Act, one fatal accident amongst every 595 persons employed in and about the mines, and one death by accident amongst every 368 persons employed; also that 198,119 tons of mineral were got for each fatal accident, and 122,509 tons for each death by accident. In the preceding year (1879) the fatal accidents and deaths in the proportion to the number of persons employed were one accident and one death respectively amongst the numbers of 610 and 490, whilst in proportion to the tons of minerals raised the corresponding figures (1879) showed one accident and one death for the quantities of 185,890 tons, and 149,400 tons respectively, showing for the year 1880 an increase of production per fatal accident, and a decrease per life lost.

The summary of fatal accidents and lives lost in and about the mines shows that at the mines classed under the Coal Mines Regulation Act, in Great Britain and Ireland, the fatal accidents were 815 in number, and the deaths occasioned thereby (some of the accidents causing more than one death) amounted to 1,318; showing an increase upon the previous year of 33 in the number of fatal accidents, and of 345 in the number of lives lost.

In another summary it appears that in the aggregate, 484,933 persons were employed in and about the coal, fireclay, ironstone, and shale mines of Great Britain and Ireland, exclusive of those employed in and about mines which are classed under the Metalliferous Mines Regulation Act. The number and ages of the persons employed underground are distinguished from those employed above ground. Of the total number of persons employed, 391,381 were underground, and 93,552 (of whom 4,640 were females) above ground. Compared with the returns for the previous year an increase of 8,123 is shown in the number of persons employed.

Academy of Sciences.

The regular semi-monthly meeting of the Academy was held on Monday evening, President Davidson in the chair. David Cahn was elected a life member, and Chas. Nelson and T. M. Whitelaw, resident members.

The donations to the Museum were as follows: From J. H. Strowbridge, a supposed upper stone of hand mill, found one ft. below the surface in making cut for S. P. R. R. on banks of San Pedro, Arizona; also two fossil shells from the banks of Rio Grande river, Arizona. From George Lovelock, four shell ornaments made of red adobe (*Haliotis rufescens*), found in beds of gravel near the shore of Humboldt lake, Nevada. Also, from same, a tomahawk or battle ax, dug up after the water had receded from the bottom of Humboldt lake, Nev. From Geo. Davidson, Jew fish (*Steriolepis gigas*, Ayres).

Mr. Redding called attention to the fact that Capt. Mallon had presented a curious Indian dress or mat, found in a bed of rock salt near the bank of the Colorado. Mr. Redding, being much interested in this evidently very ancient and curious relic, had written to Capt. Mallon for further information. Mr. Bonelli, who had given the matting and wood to Mr. Mallon, wrote a letter to Mr. Redding in answer, which he read. This letter described the locality in, and circumstances under which, the relic had been discovered.

Dr. Stout, who had visited the great salt mines of Krakon, described how the gradual movement of the salt filled up the drifts and tunnels so no traces remained, and suggested that perhaps this Indian dress had been covered up by the gradual movement of the salt deposit, where it had been found.

Mr. John Richards read a very interesting and valuable paper "On the Application of Standard Measures to Industrial Processes." We shall shortly give this paper in full, and prepared as it has been by a man of wide experience and thorough knowledge of the subject, it will be found of great interest.

Prof. Davidson stated that he would shortly start out to view the Yolo base line, and that new instruments would be used in the work. On his return he would give to the Academy the results of his observation. Owing to the lateness of the hour, several papers announced were deferred. One of these was by W. G. Fisher, "On the Earthquakes of September and October at the Island of Ugamok, Alaska." Another one was by H. D. Woolfe, "On Aleutian Family names."

A MINERS' UNION has been organized at Forest City, with a large number of names upon its roll.

The Facts About Gravel Mining.

Statement of the Miners' Association of California.

The following lucid statement of the Miners' Association of California, gives in better form than has yet appeared, the real facts about hydraulic mining in this State, and explodes many exaggerated statements of the injuries done; shows the necessity to the country of the gold product, and the desire of the miners to aid the farmers. We give the statement in full, and refer our readers, also, to the other elaborate statements by the well-known engineers, Hamilton Smith, Jr. and Col. G. W. Mendell, U. S. A., on the same subject, published in the last number of the MINING AND SCIENTIFIC PRESS:

SAN FRANCISCO, Aug. 1, 1881.

So many misleading arguments have lately been made to the public, antagonistic to the business of hydraulic gravel mining, that we deem it our duty to make the following statement, showing the facts as they actually exist, which we trust will receive that dispassionate consideration by the people of the State, which the importance of the issues at stake demand.

Character and Importance of the Mines.

California has produced since the discovery of gold in 1848, between $1,100,000,000 and $1,200,000,000 of that metal, of which very much the larger portion has come, either directly or indirectly, from the ancient or pliocene river channels. Fully nine-tenths of the placer gold thus far produced was the result of the natural washing away of these channels; the earthy matter having been carried down into the plains and inland lakes, thus building up the great valley of California; the gold, by virtue of its great weight, remaining behind in the beds of the ravines and rivers draining the western slope of the Sierra.

As the placers became exhausted, the miners naturally turned their labors toward the sources from which the placer gold had been derived. Commencing in 1851, they have steadily prosecuted the development and working of the ancient river beds, until the yield from them amounts annually to a sum varying from $11,000,000 to $13,000,000, with the prospect for many years to come of equally great returns.

Expenditures of Capital.

In order to accomplish this result, the expenditure of large sums of money has been required in building dams, canals and tunnels. The Bloomfield and Milton companies afford a good illustration of the large capital necessary for the successful development of such properties. Work was vigorously commenced on the mines of these companies in 1854, since when about $4,000,000 has been expended—all representing "capital account"—until 1878, when their works were finally completed. All this $4,000,000, with unimportant exceptions, was furnished by stockholders resident in California.

Value of the Mines.

We roughly estimate the present actual value of these mines in California to be $80,000,000; adding to this the property whose value is dependent upon the existence of the mines, there results a total present value of probably $100,000,000.

The owners of the gravel mines have been content with smaller returns from their investments than from ventures either in gold quartz, silver, copper or coal mines. They believed that the undoubted extent and permanence of the auriferous gravel beds warranted the opening of mines, promising comparatively moderate profits. At the time when by far the larger part of these expenditures of capital had been made, the right of the miner to deposit his "tailings" in the river beds was accepted by the whole State as a matter of course.

These vast investments have been made in good faith, and now demand equal protection of the law with other property.

It is falsely asserted that the stoppage of these mines would only involve the destruction of the capital placed in them, "most of which is owned by foreigners," and would inflict but little injury upon the people of the mining counties, "Chinamen, powder and water being the forces employed."

To this appeal to the passions and prejudices of the community, we can state with authority, that the percentage of Chinese compared with whites, employed in our mines, is far less than is the case at the valley farms; not one of the leading mines of the State now using Chinese labor; that out of many hundreds of mines there are only three or four held by owners not residents of the United States, and, moreover, that the net return from these three or four mines has been quite moderate.

The Injury to be Wrought by Abandonment.

The repeated assertions that the mountain counties would be but slightly injured by the discontinuance of gravel mining are so absurd to one at all familiar with these localities as to be hardly worth the trouble of refutation. For the benefit of persons who have no knowledge of these counties we will, for illustration, state the present condition of Nevada county. This county owes no debt; its taxes are low; has a population of fully 21,000 souls; has an assessed value for taxation of over $9,000,000; its inhabitants, including the daily laborers, generally own their own comfortable homes; neither in California nor elsewhere can be found a more truly prosperous and contented community; the rate of wages is nearly double that paid in the valley counties; and the miners owning their own orchards and gardens, live in greater comfort than does any laboring class in any other part of the world. Fully one-half of this population directly depends for its subsistence upon hydraulic gravel mining. Were these mines abandoned the county assessment roll would be reduced one-half; the burden of taxation would be consequently doubled on the remaining property, and depopulation and ruin would follow.

The same condition of affairs would obtain in the counties of Placer, Sierra, Plumas and Trinity, while the lower counties of Butte and Yuba would be greatly injured.

We recognize the fact that injury has been inflicted upon the farmers of Sutter and Yuba counties, but we claim that it is neither right nor expedient to destroy these prosperous mining communities because of this injury. To this point, which seems utterly misunderstood, we ask attention.

Equities of the Miners.

It is assumed that so-called hydraulic mining differs from other methods of gold mining, whereas it is absolutely identical in principle with the processes involved in either placer, drift or quartz mining. The theory of the extraction of the gold is the same; a stream of water washes away upon lower grounds, the earthy material in which the gold is embedded, the gold, by reason of its gravity, remaining behind.

In the early days of placer mining, when there were literally hundreds of thousands of miners washing the soil in every gulch, ravine and river of the Sierra, the aggregate quantity of material washed into the rivers must have exceeded the amount, which by improved, but similar appliances, is now being placed in them.

The best lands on the Yuba and Bear rivers were covered with mining debris by the great flood of 1861-2, most of which was unquestionably the result of placer mining.

The miners have gone on since 1848, following the same plan of work, but gradually, by the outlay of great sums of money, improving their earlier methods.

For nearly 30 years their right to thus mine remained unquestioned. Lately, however, the very men who came to California to work in the mines, who did work in them and contributed to cover up valley lands, who afterward settled as farmers upon the land below the mines, have discovered that it is only the farmer who has rights, and that the miner, to whom is so largely due the greatness of our State, has been an interloper and a destroyer.

When the orchards and rich bottom lands near Marysville and Wheatland were covered with debris in 1862, then the farming community should have asserted its pre-eminent rights and have thus prevented the expenditure of vast sums, since used in developing the gravel mines. The truth is that when these expenditures were made, even the valley farmers considered hydraulic mining as legitimate an industry as agriculture.

It is erroneously stated that the Sutter and Yuba county farmers only wish to close the *hydraulic* mines. In the suit of Keys vs. Little York Co., etc., several drift mines were enjoined by the lower court from further working. The language of the injunctions granted, restraining the miners "from suffering to flow muddy water," if sustained by the highest judicial authority, means absolute destruction to all gold mining, for gold can only be gotten by muddying water.

In fact, carrying this legal principle to its logical conclusion, the agriculturist would not be allowed to cultivate the slopes of the mountains.

The only way by which the pristine purity of the waters of the State can be brought back is by driving out the present population and restoring the land to the nomadic Indian, for when civilized man touches the soil, the rivers inevitably become muddy, as has been notably the case in the Ohio and other valleys of the Eastern States.

Need for the Gold.

The gravel channels of California have yielded in the past, near $1,000,000,000 in gold, which has been a mighty force in bringing about the existing prosperity of the civilized world. A still greater quantity remains in our unworked but developed channels, ready for extraction.

It is a well recognized fact that only in California does there remain a large quantity of gold, the existence of which is definitely known.

The gold product of Australia and other parts of the world has been steadily decreasing for many years past, while only in California has the yield been sustained. In this State the minimum product of $15,300,000 was reached in 1877, since when it has been steadily increasing, until for this year, 1881, if the mines are not closed by the courts, it will reach about $19,000,000. Of this, as has before been stated, much the larger portion comes from the gravel mines.

Can California—can the United States suffer this great treasure to be forever locked up in our mountains?

Is it judicious to now insist upon such action by the courts, if it can be had, as will forever close these great treasuries against the State and the world?

Exaggerated Statements of Injuries Done.

The State Engineer, in January, 1880, after detailed and careful examination, reported that 43,546 acres of land had been depreciated in value by the flow of mining debris, with a result-

ing damage amounting to $2,597,635. This has been not very largely increased during the past year. These authentic figures are raised by our opponents to 100,000 acres, and to untold millions of loss.

The depreciation in values at Marysville is well known to be chiefly due to the construction of railroads and the exhaustion of the great placer mines on the Yuba and Feather rivers, which obtained their supplies from that city.

Should the mines all be closed, as many of the valley people now seem to desire, the still further decay of Marysville is assured, and we may add that the now prosperous city of Sacramento will suffer a loss from which it will be difficult for her to recover. That this decay of Marysville is not due to increased cost of river transportation is clearly shown by the fact that freights to and from that place and San Francisco, are now, at the present low water stage, as low or lower than they have been before.

The Rivers.

That the Feather and Sacramento rivers have been injured is conceded by all, but we have the official statement of Captain Eads—as competent an authority on such matters as can be found in the world—that if the flow of heavy sand is kept from entering these streams, they can readily, by proper treatment, be brought into excellent condition.

For two or three years past the prophecy of the approaching ruin of the San Francisco harbor has been allowed to slumber. There seems of late, however, some disposition to revive this charge, and, to those desirous of knowing the truth, we would refer to the testimony of Prof. Davidson, Chief of the U. S. Coast Survey, and to that of General Alexander and other able scientific gentlemen, taken by a Legislative Committee in 1878, in order to elucidate this question. It was then clearly shown that the water on San Francisco bar was as deep if not deeper than in 1848, and the falsity of this charge was fully exposed.

It seems to be taken for granted, that we have to deal in our California rivers with engineering problems more difficult of solution than have before been encountered. This is not the case, for both in France and Italy many of the rivers carry larger quantities of earthy material in proportion to the water, than does the Sacramento. In these countries no great difficulty has been experienced in protecting the lower lands and rivers.

Desire of Miners to Aid Farmers.

From the examinations and reports of our engineers we became satisfied, several years since, that it was practicable, at a comparatively moderate expense, to safely store for many years to come all the injurious flow of mining debris in the Yuba, Bear and American rivers, by forming reservoirs by the construction of brush and stone dams in the bottoms and canyons of those streams.

The State Legislature, in 1878, authorized the investigation of this question by a board of engineers. After elaborate surveys had been made the State Engineer reported that a sufficient remedy could thus be obtained, not only to guard against future deposits of debris, but also primarily to protect the rivers and valleys from the very many millions of cubic yards of sand and gravel, which had been accumulating in the streams since the floods of 1861-2.

It seemed unjust that the present generation of farmers and miners, living in the northern part of the State, should be compelled to pay exclusively for remedying damages caused by mining many years before, which had largely benefited the whole State, especially San Francisco.

With this in view, the now famous "Debris act" was strongly advocated by both miners and farmers, who, in that measure, asked for State aid, so that the necessary funds could be procured to inaugurate a thorough system of protection. In this legislation the miners showed their willingness to pay their full share of the burden, by being taxed in three different ways, and very much more heavily than any other class.

The Debris Dams.

Under the operations of this act two restraining dams were built in 1880, one across the Yuba and the other across Bear river, at a cost of nearly $200,000. The residue of the money procured by the taxes levied under the authority of the act, amounting to some $290,000, was spent chiefly in building levees for the purpose of confining the rivers so that they might, by scouring action, deepen their beds.

These works were hastily built, and, of course, are yet necessarily incomplete. The dams, although broken, have been of much service, the one on the Yuba river having, it is thought, saved Marysville last winter from inundation. Able engineers now report that the dams can be made permanent, and that they will answer the purpose for which they were designed.

It was never the intention of the mining interests to advocate the permanent continuation of a general State tax for this relief. It was hoped that the State at large would willingly contribute the small tax of five cents on the $100 for three years, and that after that time the parties directly interested could take care of the works at their own cost, and thereafter maintain and extend them as necessity demanded.

Useless Litigation.

The condition of affairs is briefly this. Engineers, as able as can be found in the United States, assert that the mines can be worked, that the valley lands at the same time, can be protected, and that the navigable water courses of the State can be brought into good condition.

In the face of these statements by scientific authorities, it is proposed to at once cut off from the annual revenue of the people of the State some $13,000,000. The ruin of the mining counties will then follow, and yet the danger from the vast deposits of debris now in the rivers will have to be met.

With no other result than the payment of huge fees to greedy lawyers, a multiplicity of suits has been commenced, when one alone would definitely settle the controversy.

It is with regret that we see hundreds of thousands of dollars about to be spent in bitter litigation, when the same money, properly expended, would so largely contribute to the relief and settlement of the injury done to the farmers.

It has been shown how idle are the statements that the product from our mines simply enriches foreign owners. The truth is that much the larger part of it is spent for labor and supplies, and that in the end most of it centers in San Francisco. Had it not been for the mining industry that city would never have become the metropolitan and wealthy place it now is, but would, at the very best, have been a provincial town slightly superior to Portland. Can San Francisco afford to see one of the chief sources of its prosperity destroyed?

The individual members of this association are not alone engaged in mining, but are, many of them, also largely interested in agriculture, trade and manufacturing. They deprecate the attempts made to injure mining, not only because they believe it to be a legitimate industry, but because they realize that its destruction would most injuriously affect every material interest in the State.

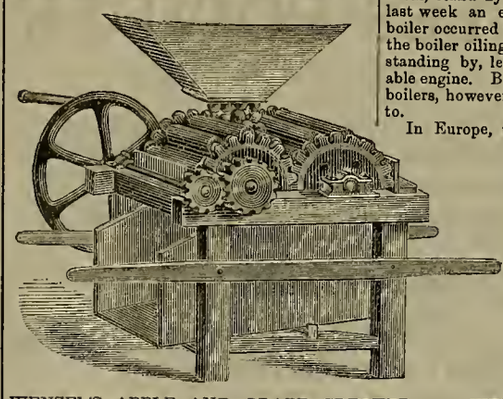
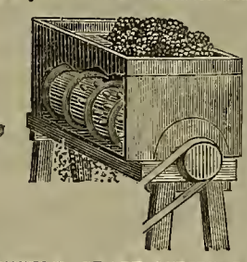
A Curious Historic Relic.

Capt. J. A. Mallon recently sent to the Academy of Sciences, a very curious Indian dress or mat, evidently woven of some straw or plant, which was found in a salt bed near the Colorado river.



WENZEL'S APPLE AND GRAPE CRUSHER.



WENZEL'S GRAPE STRIPPER.

The specimen was apparently one of an age far previous to those of which there is any record in the country where found. Mr. Redding wrote back to Capt. Mallon for further information.

The specimen was found by Mr. I. D. Bonelli, of Junctionville, Lincoln county, Nev., in a ledge of salt situated six miles above the confluence of the Rio Virgin with the Colorado on the left bank of the Virgin. This ledge of rock salt belongs to a system or belt of the same, similar to the salt mines of Salzburgh and Krakow, in Europe, and may, like those, belong to the triassic age. Mr. Bonelli has regarded them, in the absence of any fossils to identify them by, as a part of the saliferous crust superincumbent on the silurian rock. No geologist has as yet given a definite opinion for want of time for extensive investigation.

The country rock in the neighborhood is the upper carboniferous, striated at intervals with trap rock of hornblende and mellifere. The red sandstone of the upper silurian is also found protruding, and the depression of the Rio Virgin river valley shows proofs of vast streams of water having flowed there probably at the period when the great inland lakes drew off into the western ocean.

There is evidence in the position of the salt ledges and the overlying cap rock that the volcanic eruptions of comparatively recent periods have plicated them, and the probability is that these relics accumulated in the caves of salt in the very earliest period of man's existence on the globe, when primeval man lived in their caves, which later on were upheaved and cap rock formed over them by accumulating of drift, sand and induration of the same.

This is the view taken by Mr. Bonelli of the relics and their history from the surroundings. He says: "No Indian living here knows anything of the time when these caves were inhabited. The present race does not occupy any of the caves that are now open. As the New York dandy walks over the Laurentian gneiss, older than all forms of life upon the globe; and, as we live and build upon the ruins of all the ages, so may a race of savages in the early periods of the cenozoic age have lived in caves in the salina of the silurian. If this is an erroneous conclusion, then it seems proven that vast upheavals and revolutions have occurred during the recent periods of geological and even perhaps historic or barely historic time."

When it is remembered, however, that in the salt mines of Krakow the gradual but sure movement of the salt beds fills up and entirely defaces all traces of the drifts and tunnels made in it and abandoned, a reason for finding this relic may be found. In these salt deposits the salt may, and doubtless does, move in the same manner, and in moving may have covered up the garment referred to and preserved it to the present day.

Improved Grape Stripper and Crusher.

The engraving shown herewith represents a combined grape stemmer and crusher, a patent for which has this week been granted through the MINING AND SCIENTIFIC PRESS Patent Agency, by George L. Wenzel, of this city. The larger machine, which is an apple crusher, can be used for crushing grapes as well. The upper one of the engravings represents the grape stripper. When used together, for grapes, the stripper is placed above and run by a belt from the crusher. These devices are more fully described under title of "Notices of Recent Patents," on page 92 of this issue.

Insurance for Boilers.

It is somewhat surprising, when one has been about mining boilers very much, and has seen the old rattle-traps doing duty which ought to have gone to the scrap heap years ago, that there are not more boiler explosions than do occur. Patched-up old pieces of rusty iron, carrying pressures that none but first-class boilers ought to be put to, are common. And it is strange that the people who own and run them, stand by them so long as they do. Only last week an explosion of a threshing-engine boiler occurred when the engineer was on top of the boiler oiling the engine, and the owner was standing by, leaning on the wheel of the portable engine. Both were killed. The stationary boilers, however, are more particularly referred to.

In Europe, they have boiler insurance and steam power companies, who inspect and insure boilers. The chief engineer of one of these companies, whose headquarters are at Manchester, in discussing the question of additional legislation effecting boilers, says that it is quite evident that the general adoption of independent inspection of boilers, coupled with insurance, throughout the country, would lead to a very great diminution in the number of accidents. If additional legislation be really necessary, all experience, in his judgment, goes to show that it is to the enforcement of efficient periodical inspection of boilers by independent persons other than government officials that attention should be directed.

This conclusion seems a valid one. We have a good deal of "red tapery" and not much good practical result out of Government inspection. The inspection seems more a matter of form than anything else. If, however, it were left to people whose principals had to pay for bad judgment, few poor boilers would be passed. Those companies whose business lies in this direction find a gradual increase in their operations. The one above referred to, in England, reports that operations of the company during the 12 months have been on a scale of much greater magnitude than heretofore, and they have also been unusually successful. Two thousand eight hundred and ninety-five boilers were proposed for insurance, being an advance of 840 over the previous year, and the largest number proposed in one year since the commencement of the company. In addition to the ordinary inspections, 13,071 thorough or internal examinations and hydraulic tests were carried out. Only one serious collapse of flue occurred, and not one explosion, fatal or non-fatal, for which the company were liable took place, although over 20,000 boilers were under supervision during the 12 months. From these figures some idea of the magnitude of the business may be gleaned.

THE lessees of the Phœnix mine have begun to ship ore to the Richmond furnaces.

Upper Wood River and Saw Tooth Mines.

(CONTINUED FROM PAGE 81.)

Smiley's or Emma, at the head of Smiley's gulch, has an incline shaft 65 ft. in depth, at the bottom of which a three-ft. pay streak is found, averaging $100 per ton. A tunnel is now being run to tap this ledge 200 ft. below the surface. The Pilgrim, Vienna and Columbia companies all contemplate the erection of mills with ample capacity as soon as the road, now in course of construction, is finished.

The numbers on the map correspond to the following list of mines:

1 Guy.	36. Black Hawk.	71. Shamrock.
2 Montezuma.	37. Yellow Jacket.	72. Signal.
3. Regulator.	38. West Fork, No. 2.	73. Western Home.

34. Old Abe.	69. Wild Dutchman.	104. Beaver.
35. Lone Pine.	70. Town View.	105. Columbia.

This will prove one of the finest mining districts on the coast before the end of another season. The mountains in this part of Idaho are extremely high and rugged, but from Galena down, there are no obstacles to a railroad, and both the N. P. and C. P. companies already have parties in the field surveying for a route to the head of Wood River.

In less than two years hence the locomotive's whistle will shriek on the side of those grand, old peaks where only two years ago the mountain goat went undisturbed by human beings.

A. L. M.

Local Mining Laws.

In some new mining camps, because it is understood that the Government recognizes the regulations the miner makes, within certain bounds, it is frequently imagined that the miners can make any laws they choose governing locations, etc. This is by no means the case. So long as the local laws do not conflict with those of the general government, it is all well and good, but as soon as they do conflict, then the local law is invalid. This is a point which all miners should remember, and it may be impressed upon their memories by the following statement from the Commissioner of the General Land Office to a miner on the El Dorado canyon, Nevada:

In reply to your communication, I have to state that the United States mining laws provide that the locator of a lode mining claim must make the annual expenditures necessary for the maintenance of the possessory title at any time within one year from the 1st day of January next succeeding the date of the location; and the miners of a mining district have no authority to make any rule conflicting with this provision of law. If the mining laws of your district require that $50 shall be expended within 60 days after location, such provision is wholly without force. Suppose a location to have been made July 1, 1880, the $100 worth of expenditure is required by United States law to be made between the 1st day of January, 1880, and the 30th day of December, 1881, and expenditures made prior to this period, viz.: "within 60 days after location," would not be in conformity with the provision of said law.

THE IDA MINE'S STOCK.—The case of the Ida G. & S. M. Co., vs. F. W. Clute and L. F. Loveland, is on trial before Judge Pressley of Sonoma, sitting in this city in Judge Hayne's department. The company alleges that between February, 1878, and March, 1879, while Treasurers of the mine, the defendants received 10,000 shares to dispose of, which, it is claimed, they did for $1 a share. In September, 1879, they ceased to be Treasurers, and owed the mine $10,000, the amount realized from the sale of the shares, which is also the amount sued for. The defendants, on the other hand, claim that they were in the receipt of only 5,600 shares, which they disposed of for $4,470; and as they had expended $4,619 in behalf of the company in various transactions it owes them $149 56.

E. W. WOODWARD, D. B. Carver, William McCormick and Sylvaro Ruiu, have located an iron mine on the mountain east of Rutherford, Napa county, about a mile from the Whitton quicksilver mine. The locations, four in number, are each 60 by 1,500 ft., equal altogether to an area of 80 acres.

THERE is a scarcity of miners at Tuscarora The *Times-Review* says it does not desire to invite a stampede, but that all the mines are running short-handed and from 25 to 30 men could obtain work there.

California Mineral Springs.

California is exceedingly rich in mineral springs. Some of them have shown their value both in the hands of the chemists and the systems of the suffering and the afflicted. There are others which are strongly suspected of being very valuable, but there is yet no exact and trustworthy information concerning them. Several conscientious writers have done all they could to place the mineral springs of the State before the world in their true light, but their efforts have been incomplete, because the information they needed did not exist. It seems to us that the subject is a fit one for the expenditure of a small amount of the public money; in other words, that the State of California should do something to make its resources of this character known. It would be a good investment, judged from scientific and philanthropic points of view, and it is quite possible that something would be found which would attract the health-spring seekers of the world and hence fit them, while their money would assist in building up the State. The State Board of Health has shown its cognizance of the importance of our springs by mention of them in its publications, but these records, like those by private individuals, are incomplete. Let the State appropriate money enough to make official analyses of all waters which promise to be valuable, and let these analyses be set forth, and their significance set forth by some one able to make sound deductions in matters of this kind. Such a work prepared under the authority of the State, would have more weight than a private publication, although the latter, by some well-known man who had the resources and would be above the suspicions of interest in the ownership of the springs, would soon be accepted by the physicians of the world. The literature of mineral springs holds a prominent place in physicians' libraries at the East and in Europe, and their patients are sent here and there to reap the benefits which may be expected from waters with the specific properties desired in certain cases. California should certainly have a trusted position in this literature, and we think it would be proper for the State to arrange to occupy it.

MACHINE FOR PIECING OUT FLUES.—There is probably no work about a locomotive repair shop which is done in such a variety of ways as the piecing and welding of flues. In nearly every shop a different machine and process is employed in doing this work, some of which are quite ingenious, and generally, each one is claimed by its inventor as being better than any other. Messrs. Harts & Fox, of Cleveland, Ohio, have recently devised and patented a machine by which the different operations of cutting off, scarfing and welding the ends of the tubes are readily performed. They claim that the work by their machine can be done better and quicker than by any other process or tools now in use.

A NEW MEDICINAL FISH OIL.—The oil of the oolachan or boulican (*thaleichthys*), a fish inhabiting the waters of British Columbia and Vancouver's Island in enormous quantities, is finding its way into the English markets as a substitute for the cod-liver oil. This fish is of so oleaginous a nature that it is dried and used as a candle by the natives of British Columbia, being known by the name of the "candle fish." The oil has long been valued for its medicinal virtues among the native Indians, but has only lately been prepared in such a form as to compete with cod-liver oil, for which, however, it is said to be a valuable substitute.

AMERICAN CORNED BEEF, according to Mr. Wigner, in the *Analyst*, is twice as valuable as an article of diet as fresh boneless beef, and that the cooked ox tongues contain less salt and more nutritive matter than the dried tongues usually sold in European markets.

SECURE PATENTS

Through Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

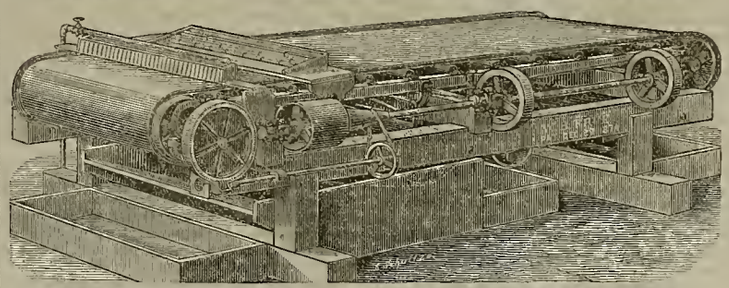
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Over 230 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and the concentrations are clean from the first working.

The wear and tear are merely nominal; the water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

ST. DAVID'S.

A FIRST-CLASS LODGING HOUSE

CONTAINS 113 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from $2.50 upwards.

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

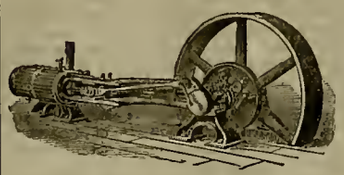
SHEET IRON PIPE.

FRANCIS SMITH & CO.,
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand

SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Ars prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

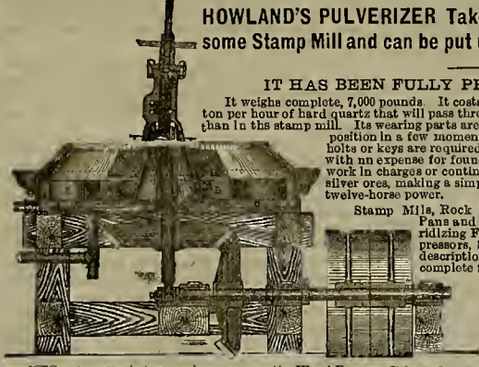
PACIFIC MACHINERY DEPOT.
H. P. GREGORY & CO.,
Nos. 2 and 4 California Street, San Francisco.
Importers and Dealers in every description of
MACHINERY!
Sole Agents for the Pacific Coast for



BUCKEYE Engine Company.

J. A. Fay & Co.'s Wood-Working Machinery; Bement & Sons' Machinists' Tools; Blake Steam Pumps; N. Y. Belting and Packing Co.'s Rubber Goods; Sturtevant Blowers and Exhaust Fan; Tanite Co.'s Emery Wheels and Machinery; Payne's Vertical Engines and Boilers; Perry's Centrifugal Pump; Judson's Standard Governors; Dreyfus Self-Oilers; Gould Mfg Co.'s Hand and Power Pumps; Eclipse Windmills; Disston & Sons Circular Saws; Otto Silent Gas Engine; Ducs' Elevator Cups; Ballard's Oak Tanned Belting.
Also on hand and for sale A FULL LINE OF MILL AND MINING SUPPLIES.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery.



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with an expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

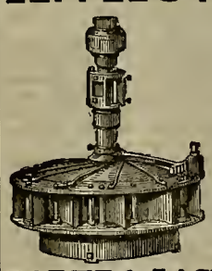
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

LEFFEL'S IMPROVED WATER WHEEL.



PRICES REDUCED!
PATENTS REISSUED 1868.
The "OLD RELIABLE" with improvements, making it
THE MOST PERFECT TURBINE NOW IN USE.
Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.
Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

SHINOLE MACHINES AND SAW MILL MACHINERY, STEAM ENGINES, ETC., TO ORDER. MINING MACHINERY OF ALL KINDS.
F. A. HUNTINGTON,
220 Fremont Street, San Francisco.

DuBOIS' Automatic Quicksilver Feeder.
A machine for feeding quicksilver to the mortars of GOLD MILLS. It is so connected to the cam shaft, that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a mechanical movement, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding ordinary hand-feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect. Price complete, $100.00. Send for circular.
P. C. DuBOIS,
18 Fremont St., S. F.

OTTOKAR HOFMANN,
(Of the Firm of Hofmann Bros.)
Metallurgist and Mining Engineer.
Erection of Leaching and Chlorination Works a specialty
Working Tests and Reports made.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.]

FOR WEEK ENDING JULY 26TH, 1881.

244,961.—APPLE AND GRAPE CRUSHER—O. L. Wenzel, S. F.
244,875.—GALVANIC BATTERIES—Folkers Bros., S. F.
244,009.—SUBMERGED PUMP—F. D. McCarley, S. F.
244,749.—BORING MACHINE—Hammond & Holman, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

APPLE AND GRAPE CRUSHERS.—G. L. Wenzel, S. F. Dated July 26, 1881. No. 244,961. This invention relates to a combined apple crusher and grape stemmer, the features of which are peculiar. The invention consists in the ordinary stand and mechanism to operate the rollers. These rollers are of wood, and are constructed with alternate depressions and elevations, the depressions being made deeper than the periphery of the ends of the rollers, thus forming a basin, whereby the juice of the fruit is prevented from flowing out at the ends, but is carried down with the roller, and discharged into a receptacle. The elevations or ridges of one roller are so rounded as to fit exactly the depressions of the other, and *vice versa*. The hopper is set over rollers and its bottom is so shaped as to direct the fruit in small quantities upon the middle of the roller, immediately within the very bottom of the depression, where it will be cut and crushed by the elevation on the other roller. Over the hopper a frame-work is built, which supports a large roller, which revolves within a stationary wire netting. The roller is provided with certain wooden pegs or teeth and spirally running flanges, the former to catch and tear the stems against the grating, the latter to carry them to one side. The grapes are fed to this roller through an opening above it, and after being stemmed are discharged through the netting into the hopper. This device is illustrated on page 89 of this issue.

GALVANIC BATTERY.—John H. A. Folkers and A. H. B. Folkers, S. F. Dated July 26, 1881. No. 244,875. This invention relates to a certain improvement in electric batteries, and it consists in a new and useful means for securing the plates to the attachments by which they are supported within the device.

What They Say of Us.

A VALUABLE PAPER.—The MINING AND SCIENTIFIC PRESS is becoming more interesting every year. Like wine it improves with age. Its issue of June 18th is a remarkable number, containing 36 pages. It is brimful of entertaining and instructive reading for prospectors and miners generally. It contains a good miner's map of Arizona, as well as much information relating to that Territory. The PRESS is well filled with California mining news, etc. Every miner would certainly profit by subscribing for this greatest mining publication upon the Pacific coast. The paper comes at $4.00 per year, and it is worth it.—*Georgetown, (Eldorado Co.,) Gazette.*

THE MINING AND SCIENTIFIC PRESS of June 18th is a magnificent number of that excellent periodical. It contains 36 pages, and is devoted almost exclusively to a description of the resources of Arizona. The PRESS will soon issue a Montana edition. — *Inter-Mountain (Montana).*

THE S. F. MINING AND SCIENTIFIC PRESS has completed its 42d volume. It is the very best paper of its class published. It is the pioneer of the mining journals, and continues a long way ahead of its followers. It is published by Dewey & Co., and as a new volume begins with its next issue, now is a good time to subscribe for it.—*Silver State (Nevada).*

THE MINING AND SCIENTIFIC PRESS, published at San Francisco, by Dewey & Co., is a very instructive journal. It is an illustrated weekly, devoted to mining and scientific progress, and to general news. It is furnished for $4 a year, payable in advance. We welcome it to our table as an exchange.—*Del Norte Record.*

THE MINING AND SCIENTIFIC PRESS has just begun its 22d year. Every mining man ought to take the PRESS, and it is as good a family paper as this coast affords.—*Inyo Independent.*

THE Bodie *Free Press* takes notice of the fact that Eastern capitalists are investing heavily in the mines of Tioga district, a region perched on the summit of the Sierra, at an elevation of more than 10,000 ft. above sea level.

Opening Exercises of the Fair.

The opening exercises of the Sixteenth Industrial Exhibition took place on Tuesday at the Grand Opera House, and was largely attended by an appreciative audience. The programme was as follows:

Grand opening overture, orchestra; introductory remarks, P. B. Cornwall; "Monastery Bells," orchestra; prayer, Rev. T. K. Noble; ballad, Miss Ellen Coursen; poem, Miss Clara Dolliver; "The Geyser March," orchestra; oration, Hon. W. W. Morrow; prelude and "Star Spangled Banner," Miss Ellen Coursen; grand tableau of mechanical arts.

Mr. Morrow's address we will give next week, the pressure on our columns not affording space in this number. We append, however, the address of President Cornwall, which was as follows:

I do not propose to occupy more than five minutes of your time in complying with the custom which requires the President of the Mechanics' Institute at the opening of each of its industrial exhibitions to present a few brief remarks pertinent to the occasion. I will begin by saying that the chief objects for the accomplishment of which the Institute was founded, were:

To establish and maintain a permanent and circulating library of useful and valuable books.

To inaugurate and support lectures, and classes for instruction in mechanics and the sciences.

And to hold from time to time fairs or industrial exhibitions, not like the fairs of some parts of Europe, as places for barter and sale, but to enable those who have acquired particular skill and excellence in old methods, and those who have invented new machines or methods of construction or manipulation, to exhibit and compare their achievements that committees of experts may award prizes to those who have made the greatest progress; and, particularly, by exhibition, examination and competition to encourage and promote continued progress toward the greatest excellence in mechanics and manufactured articles, and to extend and increase the information of the general public on these and kindred subjects.

It is 26 years since the Mechanics' Institute was organized, and 24 years since its first fair was held, on the ground now occupied by the "Lick House," on the corner of Sutter and Montgomery streets, which was then on the outer edge of the city, in the sand hills, beyond the limit of paved streets and sidewalks.

The superficial floor space of the first fair building was 20,000 ft.—that of the present building is 190,700 ft., being more than 9½ times greater than the first, and it may be fairly said that the increase in numbers, variety, usefulness and excellence of articles exhibited from San Francisco manufactories, is in greater proportion than the increase of space for exhibition.

The growth and enterprise of the Institute, with its library, its lectures, and its industrial fairs, has been fully up with the growth and progress of the city.

Its exhibitions are self-supporting, and besides their mechanical and educational advantages, they supply an agreeable and much needed center for social promenade, with excellent music, extensive art galleries and beautiful pictures.

By actual count, over 390,000 persons have passed in at the doors during a single fair, and it is believed that the 15 fairs, which have been held, have each brought to the city from other parts of the State at least 12,000 persons, who have expended an average of $10 each at stores and hotels, making a total sum of $1,800,000 thus put in circulation here within the past 24 years.

The library of the Institute, containing over 30,000 volumes, principally of rare and valuable books, is constantly replenished with *current new* publications on all subjects.

The Mechanics' Institute is the only association in this city or State that provides every year a course of free public lectures on literary, scientific, mechanical and historical subjects by able scholars.

Finally, it is a live self-supporting institution. Its membership is so cheap as not to be a burden to anyone. Its members are men and women of the scholarly, professional, mercantile, mechanical and laboring classes; but are most largely composed of the great reading, thinking, working middle class, who plan and build, who mine, forge, hammer and rivet, in times of peace, and are of such as, when the occasion comes, in times of peril, shoulder the musket or draw the sword in their country's defense; some of them have experienced the privations, hardship and weary marches of tedious campaigns—have honorably fought in bloody battles of awful war, and are now most peaceful but earnest workers for our Mechanics' Institute, and the good it is trying to accomplish. We invite you all to become members of the Institute.

THE San Francisco Cordage Works, of this city, celebrated the other day the 25th anniversary of the organization of the works. All the employees were given a holiday on "full time." The proprietors entertained all those who had been with them since the establishment of the rope-walk, at Sausalito, where the steward of the San Francisco Yacht Club prepared them a chowder. All hands returned to the city on the yacht *Lolita*. It is seldom in this country that one hears of works keeping 15 or 20 hands for 25 years consecutively.

News in Brief.

THERE is a strike among butchers in New York.

AMADOR county's assessment role foots up $2,924,119.

POPULATION of Los Angeles county, 33,379.

TAXABLE property of Plumas county foots up $2,194,210.

TWO million sacks of wheat will be harvested in Colusa this season.

THE news is again received that Carl Schurz will succeed White as Minister to Berlin.

THE authorities at Berlin are trying to find the author of the threatening letter addressed to Bismarck.

AT Boston the Grand Trunk railroad is making—$82,000 in double eagles, $2,250,000 in standard dollars, and the remainder in subsidiary coin.

CLARE Sewall Read, the English agricultural author, thinks the outlook for a good harvest is not favorable.

CENSUS returns show that the population of the Dominion is 4,350,933, an increase of 680,498 in the past 10 years.

A TERRIBLE explosion has occurred in a mine at Lonrches, Department of Nord, France. Ten persons were killed and 20 badly injured.

THE coinage during July aggregated $3,896,- ing time contracts on westward bound freights, at low rates, extending into the winter months.

THE French Chambers of Deputies, in spite of the government only desiring a partial sale, has passed a bill for the sale of all the crown diamonds.

THE Emperor of Germany has conferred upon Prof. William Dwight Whitely, of Massachusetts, the Order of Merit, made vacant by the death of Thomas Carlyle.

POPULATION of Solano county, 18,475; of Benicia, 2,794; of Rio Vista, 666; of Vallejo, 5,987; of Suisun and Fairfield which are contiguous, 978; of Dixon, 876.

THE citizens of San Luis Rey, San Diego county, will celebrate the 100th anniversary of San Luis Rey Mission, beginning on the 25th of August next, and continuing for four days.

THE R. R. Co's. steamer, *Modoc*, ran ashore the other day on the Two Brothers, at the entrance of San Pablo bay. She was so much injured that she had to be docked for repairs.

IT is estimated that the bullion and matter output of the Summit Valley district, Montana, for the year 1881 will be at least $3,000,000, and that for 1882 it will be fully twice that amount.

SAYS the San Diego *Union:* It is a coincidence worthy of note that the first locomotive and the first steam printing press, ever seen on the Bay of San Diego, were "fired up" on the same day.

GOVERNOR CRITTENDON, of Missouri, offers $5,000 for the arrest and conviction of each participant in the robberies or murders at Glendale and Winston, and for the arrest of Frank or Jesse James $5,000 each extra is offered.

THE Ministerial Union of San Francisco has adopted a resolution of thanks to D. O. Mills, for his donation of $75,000 to the State University, for the foundation of a Chair of Mental and Moral Philosophy and Civil Polity.

RELIABLE information from Bowie station, Arizona, has it that the mysterious death of five men, a few days ago, was due to poison. It is hinted that it was the result of a conspiracy to secure certain mining interests owned by the victims.

IT is announced that the plot for the assassination of the Czar has been discovered and frustrated by the police. A lady of high family was chosen as assassin. Her accomplices have been arrested, but she herself escaped. The Czar and family left Moscow secretly on Sunday for Novgorod.

GEN. CROOK, commander of the Department of the Platte, has had added to his jurisdiction the care and territory of the Utes, Uintahs, White River and Uncompahgre Indians, who are being removed from Colorado to a new reservation in eastern Utah, near the junction of the White and Grand rivers.

TWENTY-FIVE ships and barks, composing fully two-thirds of the grain fleet, arrived in port between Friday and Tuesday. The nationalities of these vessels is as follows: British, 16; American, 6; German, 1; Norwegian, 1, and French, 1. Part of the varieties of cargoes brought by these vessels was 30,000 tons of coal.

THE steam sawmill owned by B. F. Way, about 20 miles east of Sonora, was entirely destroyed by fire last week. The mill, dwelling house, seven cabins and from 1,300,000 to 1,500,- 000 ft. of sawed lumber belonging to S. S. Bradford was entirely destroyed. The loss will amount to $25,000, upon which there is no insurance.

THE New York *Sun* says: Just why the Chinese government has seen fit to recall its young men, who have been studying in this country, is not yet clear, but that they are to continue their studies in England, France and Germany is denied by Kwong Ki Chin, the Educational Commissioner at Hartford.

THE recent scare among the settlers at Bruneau valley, Idaho, was occasioned by a portion of Panwick's band of Piutes, who are ranging through the Juniper mountains, where they go every year to fish, hunt and gather berries. These Indians were seen by stockmen, who supposed them to be hostile. The Indians are perfectly harmless.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. F. OSBORNE—San Francisco.
O. W. MCCREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Yuba and Sutter counties.
D. W. KELLEHER—Napa, Nevada and Placer counties.
OZRO H. HOPKINS—Amador county.
A. LEONARD MEYER—Utah and Idaho Ter.
O. E. WETMORE—Alameda county.
J. M. WOLFE—California.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We will send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

THE State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry O. Hanks, State Mineralogist.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Co.,

SAN FRANCISCO, August 2, 1881.

At a meeting of the Board of Directors of the above-named company, held this day, Dividend No. 31, of Seventy-five Cents (75c.) per share, was declared payable on FRIDAY, August 12, 1881, at the office in this city, or at the Farmers' Loan and Trust Company in New York.

WM. WILLIS, Secretary.

Office—Room No 20, Nevada Block, No. 309 Montgomery St, San Francisco, Cal.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half year ending this date, the Board of Directors of The German Savings and Loan Society has declared a dividend on Term Deposits at the rate of five and one-tenth (5 1-10) per cent per annum, and on ordinary Deposits at the rate of four and one-fourth (4) per cent. per annum, free from Federal Taxes, and payable on and after the 11th day July, 1881. By order, GEO. LETTE, Secretary.

San Francisco, June 30, 1881.

ASSESSMENT NOTICE.

Consolidated Pacific Mining Company.

ASSESSMENT, NO. 3.

Amount	Forty Cents per Share
Levied	July 9, 1881

Excelsior Blasting Powder,

—MANUFACTURED BY—

THE EXCELSIOR POWDER COMPANY.

—o—

This is no NEW PATENT NON-EXPLOSIVE SAFETY POWDER, but the GENUINE STANDARD ARTICLE, and as safe to use and handle as any Nitro-Glycerine Powder manufactured. The Fumes and Gases, common in other Nitro-Glycerine Powders, are almost destroyed, and do not leave the miner with headache or nausea. Among the numerous recent testimonials the following is but a fair sample, constantly received, attesting the superiority of EXCELSIOR POWDER:

AUBURN, Cal., May 26, 1881.—EXCELSIOR POWDER CO.: I send you, per Wells, Fargo & Co., a box containing samples of country rock through which I am running our tunnel on the Conrad Mine, and through which we have now run 425 feet, 225 feet of is having been done with EXCELSIOR POWDER. If any one can produce harder rock I would like to see it. I here say that I can do more execution with your No. 2 Powder in this rock than I can with any No. 1 Powder of any manufacture I have ever used, and I have used every kind now manufactured here, excepting "Tonite," and I have had 20 years' experience in blasting. Respectfully yours,

E. W. ROBERTS, Superintendent.

Give this Powder a trial and you will use no other. For Strength and freedom from noxious fumes, it has no equal. Address all orders to EXCELSIOR POWDER CO., No. 330 Pine Street, Rooms 53 and 54, Academy Building, San Francisco, Cal.

GOLD MINERS

Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.,

Office, No. 320 Sansome street, Room 58.

RICHARD C. REMMEY, Agent,

Philadelphia Chemical Stoneware Manufactory,

1100 E Cumberland St., Philadelphia, Pa.

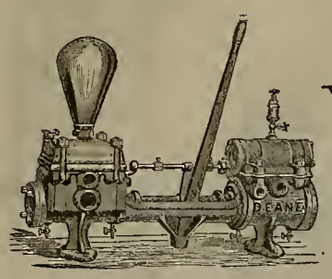
Manufacturer of all kinds of Chemical Stone Ware for Manufacturing Chemists. Also, Chemical Bricks for Glover Towers.

WIND MILL. One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.

FULTON IRON WORKS,

Hinckley, Spiers & Hayes,

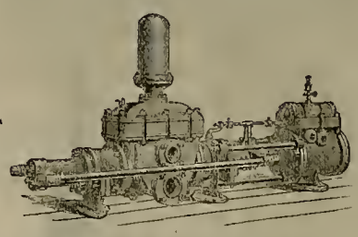
(Established in 1855.)



WORKS—Fremont and Howard Streets,

OFFICE—No. 213 Fremont Street.

SAN FRANCISCO, CAL.



HOISTING WORKS—Whims for prospecting small mines; Portable Hoisting Engine and Boilers with Reels, suitable for wire or hemp rope, of new designs, embodying all the latest improvements.

MINING MACHINERY—Hoisting Cages, with safety attachments, safety Hooks, Ore Cars, Ore Buckets, Water Buckets, Car Wheels and Axles, Ore Gates, with racks and pinions for Ore Bins, Pumping Machinery, Air Compressors, Air or Water-pipe Receivers, etc., etc.

MILLING MACHINERY—Gold Mills, with Pans or Concentrators, as required, Silver Mills, either for dry or wet crushing, with roasting and drying furnaces. Pans, Settlers, etc., as required. Smelting Furnaces, for either Lead, Copper, Silver or Gold, Willard's Roasting Furnaces, especially adapted for gold ores, Retorts, Bullion Molds, Ore Feeders, Rock Breakers, etc.

MISCELLANEOUS MACHINERY—Saw Mills, Flour Mills, Oil Well Machinery, Water Wheels and Castings.

ENGINES AND BOILERS for any and all purposes, adapted to the economical use of fuel.

PRICES MODERATE.

Among Others the Following Have Been Built By Us:

Tombstone Mill—15 stamps.....for the Tombstone Mining Company.
Corbin Mill—25 stamps.....for the Corbin Mining Company.
Contention Mill—25 stamps.....for the Western Mining Company.
Sunset Mill—10 stamps.....for the Head Center Mining Company.
Grand Central Mill—30 stamps.....for the Grand Central Mining Company.
Stonewall Jackson Mill—10 stamps.....for the McMillan Mining Company.

SEND FOR PRICE LIST.

AGENTS FOR THE PACIFIC COAST FOR THE DEANE STEAM PUMP.

THE O'HARRA
CHLORIDIZING FURNACE.

Patented in 1878.

SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1 10 per ton to work 40 tons in 24 hours.

At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61¼.

Lewis Chalmers, of the Isabella G. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenual sulphurate of silver up to from 84% to 95% of the assay.

SEND FOR DESCRIPTIVE CIRCULAR TO

VOLUME XLII Number 7.

A New Form of Girder.

Experiments at the Rolling Mills with Jackson's Cast-Iron Girder.

Some interesting experiments were conducted the other day at the Pacific Rolling Mills, with a new form of cast-iron girder, the invention of P. H. Jackson, late Chief of the Bureau of Iron Construction, Department of Buildings, in New York. The experiment was really one on a mode of using cast iron when subject to transverse strain, by which its whole cross section is compressively employed without taxing its comparatively feeble resistance. Before describing the girder, it may be well to bring forward for consideration some points on girders generally.

Cast iron possesses the enormous compressive resistance of 93,000 lbs. to the square inch, while its tensile strength is but from 14,000 to 15,000 lbs. The ratio computed by Mr. Hodgkinson is about 6½ to 1.

The object attained in this construction is a perfect girder. When employed the bottom or tie rod is tention, and the arch is in compression in every part with no tensile strain whatever; the latter an object not before attained. The antagonistic force of compression to resist the tensile strain of the tie rod is exerted at the bottom or intrados of the arch, and this force is increased in the ratio of the increment of the load on the arch. The remaining part of the arch above the bottom is naturally compression due to the load. A summary of the peculiarity of this arch is as follows:

It is in effect a device for employing cast iron compressively, neutralizing the tensile strain due to transverse strain. The tensile strain on the tie rods is reciprocally utilized in compressive resistance at the intrados of the arch, thus destroying tensile strain in every part of its cross section. Another advantage in construction of a metallic girder made in sections of its lengths is, that should the tensile strain at the intrados of the arch, exceed that of compression by the action of the tie rods, the deflection of the arch is limited to the length of a bay only. For instance, in a girder 150 ft. in length, made in 10 bays, each 15 ft. long, the deflection that would injure the strength of the material of the arch is limited to the length of a bay of 15 ft., instead, as in other constructions, its weakness, by deflection, would extend over its whole length.

The neutral axis of this girder exists between the tie rod and the bottom or intrados of the arch, or midway between the antagonistic forces. With the segmental arch in one piece and the tie rod to resist the neutral axis, is near the bottom of the arch, and travels upward as the load is increased; as the neutral axis will exist wherever the two opposite forces cease to exist, being indifferent to either force. The economy in the use of this neglected material, cast iron, for long spans when subject to cross strain, is in the employment by which its tensile strength is not called into play; also another grave objection is by an unequal distribution of the metal, causing weakness in the casting when forming from the molten to the solid state, and from that condition until cold. The heavy parts in contraction, control the thin or weaker parts, or if the formation of the mold is such that the ends of a long casting set deep in it and offer a resistance to the contraction of the metal when forming from a liquid to a solid state both of these adherent weaknesses continue and increase until cold. These weaknesses are entirely due to separation or taxing its comparatively feeble tensile strength, and not in the least injuring it in its compressive resistance, as cast iron is never in a contracted state other than cold; and as long as cast iron is used compressively, it makes no difference how many pieces it may be in of its length, providing its abutting parts squarely or equally meet and are kept in line. Take, for instance, the area of the abutting parts of the 25-ft. girder shown in the engraving or the cross section of the bottom flange in the center of a bay, which is 16 inches wide by 1⅛ inches thick, which equals 18 inches.

Eighteen inches multiplied by 93,000 lbs. to the inch equals 1,674,000 lbs., or 744 tons; taking it at one-fourth when employed, we have the resistance of 186 tons as a safe employed load. The area of the tie rods to resist this compression at 8 tons working strain per inch, providing the arch has suitable rise, would be 23¼ inches, or more than 3 of 3 inches diameter rods. Tie rods are cheap—merely bars of wrought iron with threads and nuts. When a railroad train enters on a bridge borne by these girders, the opposite end to the train is prevented from raising by the abutting parts on the bottom of the arch compressively exerted. There is no part of the arch in which tensile strength is employed.

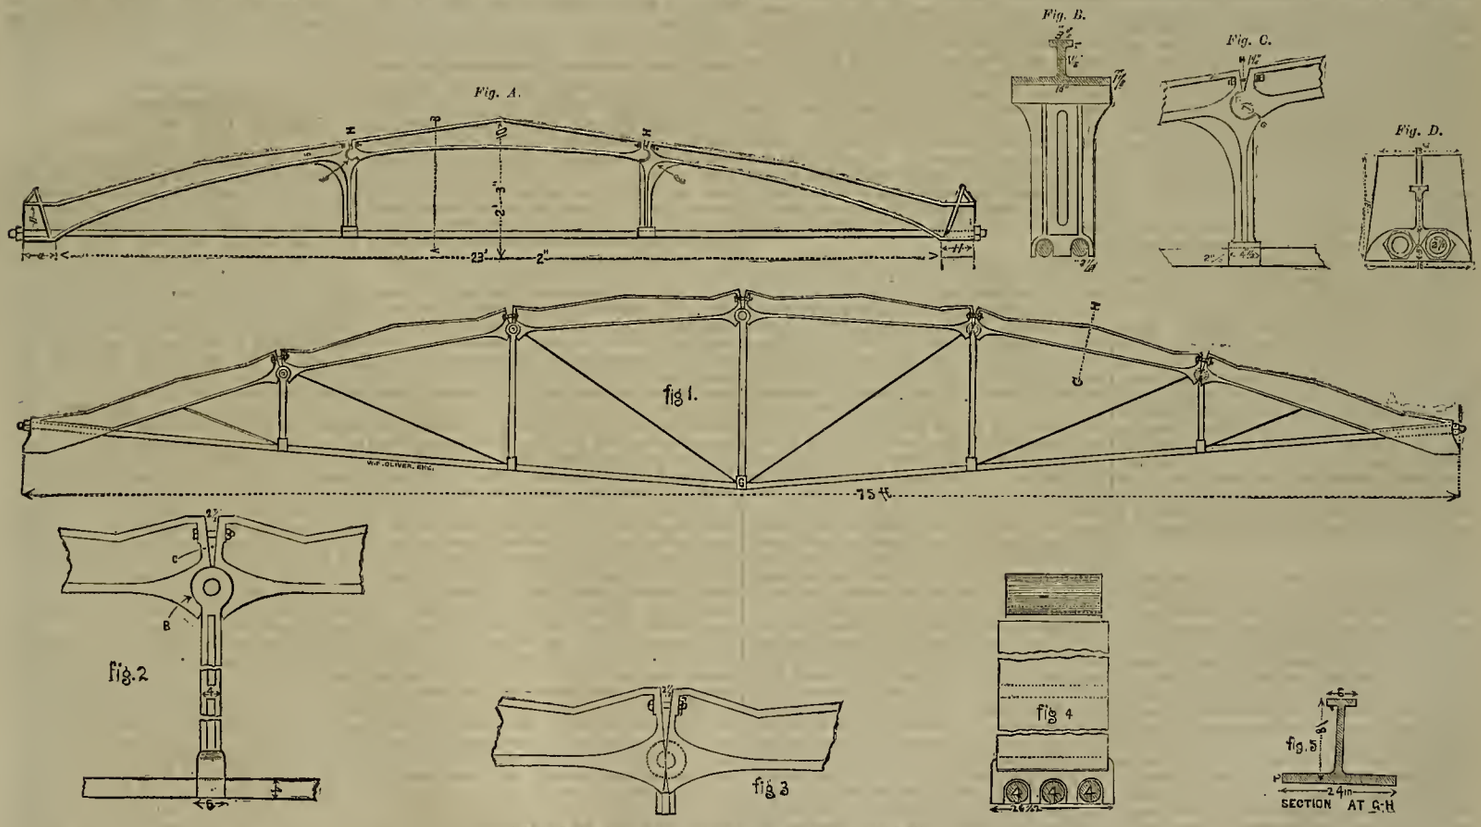
The object of this device was to construct a perfect girder, the whole arch resisting compression, the tensile strain necessarily exerted by the ties, and using this essential resistance to render indifferent a most destructive force to cast iron, viz: The tensile strain due to cross strain, showing an economy in this mutual antagonism, an equilibrium and forces negatived.

The inventor has endeavored to make a continuous arch embodying the principle of the Voussoir arch. Mr. Jackson's is a sectional, continuous arch employed compressively over its entire cross section.

A Voussoir arch is composed of many blocks to make up its length, and without the use of cement or mortar between the blocks. With the exception of friction of the blocks as they slide downward, taking a more compressed position as the load upon them is increased or the abutments yield, there is no tensile strain whatever, upon them, and the calculation has only to be made as to the strength of the material in its compressive resistance. With a continuous segmental arch, made in one piece of its length, there is, at every point, a bending moment and a thrust force; therefore, a continuous arch brings into play both compression and extension as that of a straight girder, but with more of compression than extension. See page 9 of W. Airy's book on iron arches.

With an iron arch in one piece of its length, the wrought iron tie rods elongate in the ratio of 1-1000 of its length to every 10 tons tensile strain per square inch of cross section, and this elongation is considered the measure of the elastic force of the metal.

At this strain the elongation would be for a 25-ft. girder same as shown in the drawings, 3-10 of an inch. 25 ft. equals 300-1000 inches, equals 3-10 of an inch. At this elongation of the rods, be the material of the arch either of cast or wrought iron, the arch loaded will have so far straightened as to cause great tensile strain at the bottom, giving free play to



DETAILS OF NEW FORM OF IRON GIRDER.

The Hydraulic Mining Question.

A Candid Review of the Subject.

Editors Press:—Having carefully read the letter of A. B. Paol, published in the *Bulletin* of the 23d ult., also the "rejoinder" by a citizen of Marysville, published on the 28th ult., and realizing the power and usefulness of the press in presenting different phases of important and vexed questions to the arbitration of public opinion, I ask a space in your columns for a few thoughts upon the subject matter discussed in said communications, and hope that a mutual interchange of opinions between the parties in interest may result in a final solution of the questions involved in accordance with equity and justice.

"A citizen of Marysville" starts out by asking the privilege of stating a few "facts" in reply to Mr. Paul. Let us examine a few of his self-named facts and see if they are anything more than assertions.

His first asserted "fact" is, "that if there are mines so situated that they must use the rivers and their tributary streams as a dump, or stop mining it is their misfortune." To place this assertion in the category of facts would seem to require a final decision of the questions at issue; should the decision be favorable to the miners, the fact would be that if there were farms so situated that they could not prevent an overflow of debris it was their misfortune.

His second asserted fact is "that the city of Marysville is not acting for itself alone, but for the whole surrounding country (a very large area), and is supported by every thinking man in the Sacramento valley" (a statement broad enough to match it). If this assertion has been so verified by the aforesaid citizen as to enable him to substantiate it as a fact, it must have cost him a large amount of time and labor; perhaps the conclusion was arrived at by a process common in many minds, who fancy that people differing from them do no thinking.

His third asserted fact is that "every man who comes here (Marysville), from the mines, sees that if the present flow of debris does not cease, the entire destruction of this section is inevitable." As he gives "this section" no bounds, the foundation for this "fact" is not clearly seen through the fog.

His fourth "fact" is, that "our people (of Marysville), are not devoid of human sympathy or callous to the interest of others." I am willing to accept it as a fact on trust, barring perhaps a few exceptions. ("Citizen" will please not consider this remark as personal).

His fifth asserted "fact" is, that Mr. Paul's assumptions, "hydraulic mining is not going to stop," and "valuable farms are not to be destroyed by recklessly dumping debris upon them," stand on a par with an assumption that the rain shall fall and the ground retain no moisture, and if verified by "Citizen," implies such an exhaustion of the subject matter as would take an educated engineer long time and great labor to arrive at. The conclusions of a corps of trained engineers, after a scientific exploration, would be more worthy of a place in a cabinet of facts than the crude assertions of an interested party, suffering perchance under a heated brain.

His sixth asserted "fact," is, "that as for the continuing of the present system of hydraulic mining and the use of the Sacramento valley for homes and cultivation it is an impossibility." Had he have limited his assertion to a portion of the valley would have been correct, but we fancy, as will be explained further on, that the stopping of the mines to-day and forever would not remove the danger in that direction, as far as the present generation is concerned. So much for his asserted facts.

His opinion that the comment of a London mining journal upon Judge Keyser's decision in the Keyes case comes from an unprejudiced source, will not be accepted as of much value, until something more is known of the unprejudiced condition of the writer's mind and his capability of forming an intelligent opinion from familiarity with the peculiar aspects of the case, law-like science must travel slowly and carefully in the investigation of new and difficult problems.

In estimating the gain or loss to the State of California and comparing the number of men supported by mining with those supported by farming, "A Citizen of Marysville" should include in the former industry nearly all the inhabitants of mining districts, and should also remember that a large portion of farm employees are semi-tramps, who huddle into the cities during the winter months and do not form so valuable a portion of the body politic as miners who have steady and constant employment (as do most hydraulic miners), the year round. That mining companies as he asserts (a pettifogging plea), hire Chinamen is true in many, doubtless in most if not all cases, so does nearly every one else from the veriest blatherskite that ever hurrahed for "Dinnis Karny" up, when they deem it for their pecuniary advantage.

His assertion that with hydraulic mining stopped the miner could fall back on quartz and drift mining looks a little cloudy, when we reflect that every quartz mill is a sand factory, and his whole argument is built upon sand and a sample was forwarded with it to the press.

His estimate that there has already been dumped into the Yuba river alone, debris enough to cover the entire Sacramento valley one foot in depth, we have not the data to prove or disprove, but assuming it to be a "fact," we can safely add for the Feather, Bear, American and other rivers and creeks, three ft. more. Now the bulk of this debris lies in the beds of the rivers and creeks, and it might be well not only for a "Citizen of Marysville," but for every other citizen, to look the matter squarely in the face and see if the horse is not out of the stable, the door of which the crusaders against hydraulic mining are in such a hurry to put under lock and key. Let "Citizen" come up into the mountains and we will show him some things about the action of water upon debris—will show him how an artificial river, a long sluice, when clogged, will remain so in spite of all attempts to clear it by working or filling in at its head, but go to the foot and remove a small portion and the debris will gradually run out; should you excavate a narrow channel through the center and then send through a gradually increasing stream of water like that sent by rain through the rivers, you would send it out with a rush; this it seems to me would probably be the action of the rivers should mining be stopped, the side streams coming in near the lowlands would free the lower portion of the steep grades and let the rest come gradually tumbling down, or the summer flow would cut narrow channels and the winter rains send it down in large masses to the valleys; for one, I believe the valleys would be safer by keeping up the surface drift to repair waste and keep the grade even and continuous. Take a river bar, work it from the head, and the unworked portion will remain intact for years, but commence at the lower end and the first high water is liable to clean it out as clean as a "Citizen of Marysville" would clean out a hydraulic miner. The mischief, as far as the valleys are concerned, is already accomplished; if you stop all mining to-day you cannot stop the rivers, and just as sure as water runs down hill will they, unless artificially prevented, send their present mining debris plus the annual wash from the mountain sides into the valleys. Would it not be better for the valleys and the mountains to work together in harmony and devise some way to save both their industries for the public good? All our valleys are results of debris washed from the mountains and hills; look at the artesian well in the court-house yard at Stockton, sunk through many hundred ft. of water-deposited matter without reaching bedrock. The miners are only hurrying up the work of Dame Nature, making the old lady do in a few years what it would take her many to do without a little spurring.

Now for a general view of the situation. I hold (by imagination), in my hand the little piece of gold that Mrs. Weaver boiled in lye to test its integrity; it started a ripple that spread from mountain to mountain and ocean to ocean over the world; the debris from which it was washed flowed down the river on its passage to the valleys below, and from that time the same process has been going on, gradually increasing in volume. Its acknowledged results are the peopling of the Pacific coast; the creation from three insignificant Territories of three active, prosperous States; the developing of more than that number of Territories to a condition in which they are becoming restive under the shells of incubation and trying to kick them away; the placing of our nation in the world's front rank as a producer of precious metals, and in the confirmed belief of many, carrying the Ship of State in safety over the rocks of secession, enabling it to keep the banner of a republican government floating at its mast-head.

These are some of its great results; among the minor ones are the making of many wealthy men from victims of poverty, and among them are many farmers, who, having purchased their farms from the profit and sale of mines in the mountains, would now say to the men who purchased them, you must stop mining or provide for it some new system, not quite so foolish perhaps as he who killed the goose that laid the golden egg, as they have taken the precaution to sell the goose before seeking its life, if the goose is in danger. In view of all the circumstances, it would seem as if the nation who sold her the ground to scratch on could well afford to pay the damage caused by the scratching.

There is an old maxim that "custom makes law," and it would seem that a system of mining practiced for over 30 years, ever since the "first specimen" was exhumed from its resting place, encouraged and fostered as it has been by the National and State Government and pointed to with pride by all classes throughout the nation, should cover the miners' business with something like the sanctity of law, and give them some rights that the public were bound to respect.

In answer to "A Citizen of Marysville's" "law of the case," I would remind him of the inherent right of every government to condemn private property for the public good, and should the State or National Government consider the mining interest of sufficient public importance to condemn the farming land injured thereby and levy a tax to pay for its value or for the damage done to it, they have an undoubted right to do so, but to ask the miner to abandon his property to save the farmer is asking a little too much. There has been neither fraud or deception practiced by the miners in the premises; the farmers have settled in the valleys with their eyes wide open, knowing the danger, if not knowing it was from inability or neglect to read a lesson spread in an open book before them.

To his bravado and plea for sympathy in his Grange programme, I would say that his remarks apply with equal force to the miners; both classes belong to the same race, and though the miners may crawl into more "holes" than the farmers, their experience there does not tend to make them more "submissive." Their wives, children and homes are as dear to them as are those of any other class to them, and they are in full as much danger of becoming reckless as would be a Granger if dealt with in a manner deemed unjust. But enough of this; palsied be the hand or the tongue that would stir up discord and dissension between the two parties whose interests are so interwoven together; far better be taxed to promote peace and good will than be hired to stir up contention and strife.

Hoping that all parties in interest will take counsel of reason and act together for their real interest instead of being led by the nose at the beck of brawling politicians, or giving their ear to scheming, impecunious lawyers, I remain by the grace of God and the Continental Congress,

A Hydraulic Miner.

Inter-Mercurial Planets.—No. 3.

A Probable Transit October 12 or 13, 1881.

Editor Press:—Lest some of your readers should suppose, after reading my letter No. 2 in your issue of July 16th, that the best interpretation I can give to Leverrier's 33.0225-day sidereal period hypothesis, and its relation to W. G. Wright's observance of transit, Oct. 24, 1876, and the ratio of displacement of node, makes the forthcoming transit fall due at 5 P. M., October 12th, at San Bernardino, I should like it to be clearly understood that the data gives a margin up to nearly 6 P. M., Oct. 13th. For example: 5 P. M., Oct. 12, 1881, was obtained by taking 50 apparent periods of 36.2825 days from Oct. 24, 2h., 0 P. M., 1876, assuming that as the middle of Wright's transit. The periods were obtained by dividing 6,422 even days from Lescarbault, March 26, 1859, to Wright, Oct. 24, 1876, by 177 periods. That was necessarily only approximate, therefore, that the main relation of Leverrier's hypothesis and Wright's observation should not not be lost sight of in the minutiæ of detail; but as the time approaches for instructing intending observers in various localities, where, if the transit is not clouded, it may be viewed with more or less advantage, it becomes necessary to explain the features that bear upon the inquiry more in detail. Of course, the Lescarbault-Wright interval was really days and fractions, not even days. For instance: Lescarbault's observance was probably about 35m. before the middle of his transit, which was only a small arc of the sun, 9′ 17″, instead of the full diameter, 32′, and took about 1½h. to make the arc. Lescarbault's first observation being at 4 P. M., when it had already commenced, the middle was, therefore, about 4:35 P. M., near Paris. Wright's observation was at 3 P. M., but the middle probably occurred about 1:30 P. M. in longitude 117½° west from Greenwich, or about 120° west from Paris, making 8 hours difference in time, which added to 1:30 P. M. makes 9:30 P. M. Paris mean time, so that there was 4h. 55m. fraction of a day in the interval more than 6,422 days. The interval, therefore, was about 6,422.2045455 days, which divided by 177 apparent periods, gives *exactly* 36.2836415 days each. Then taking 50 more such periods, it gives us Oct. 12th, 5h. 52m. 11s., in longitude 117½°, or say 6 P. M. in longitude 116°. But while the last known periods, up to Wright's observation, Oct. 24th, 1:30 P. M., 1876, may be indicative of present periods, approximately, we should probably be more correct in using Leverrier's principle of taking the mean of several periods, embracing a long interval. Although owing to inequalities in the revolutions, Leverrier's computation missed the exact date of Wright's observed transit, and consequently failed on March 22, 1877. In order to be successful, therefore, we must make all possible allowance for our margin, after seeing what the data itself gives.

We find that Leverrier—see *Nature*, October 26, 1876—based his computation on the whole interval from Jan. 1, 1750 (or 1750.0 as expressed), to Lescarbault, March 26, 1859, which we have considered must have been about 4h. 35m., P. M., Paris mean time. That interval was therefore 39,897 days, and .1909722 fractional, and required 1,099 periods of 36.3031765 each, and Leverrier probably took 176 such periods, or 6,389.36 days, to Sept. 21, 1876, when he made the conjunction one, and then five more to March 22, 1877, for the transit he thought due. The transit occurred, as we have shown, on Oct. 24, 1876, so that the Leverrier periods were too long for the Lescarbault interval; but if it was in reality the same planet, we should be justified in looking for a return to the mean periods of 1750–1859, at an early date, and perhaps during the present interval from Wright, Oct. 24, 1876. That presumption would make 50 periods of 36.3031765 days each, fall on Oct. 13, 5h., 18m. 43s. P. M. at San Bernardino, or in longitude 117½° W., which in round numbers, is 23½ hours later than the Lescarbault-Wright interval would denote the present periods would make. Both results are not very favorable for California, as the sun will have set, or nearly set before the middle of transit at San Bernardino. But if we examine the interval from De Cuppis to Lescarbault, or from Oct. 2, 1839, which was taken at noon, and therefore makes 7,115.1909722 days, we find that that gives 196 apparent periods of about 36.302 days each, and makes the time about 2h. earlier, or Oct. 13, 3h. 54m. P. M., in longitude 117½°. That would afford much better chances of the middle of the transit being observed on the Pacific coast; and give over 1½ hours before sunset at San Bernardino in long. 117½° W. lat. 34½° N. At New Orleans the middle would occur about 5h. 44m. P. M.. Chicago would miss the middle, for, being in latitude 41½°, sunset would occur half an hour before the middle, At San Francisco it would be due about 3h. 35m. P. M., or 1h. 50m. before sunset. The probabilities are certainly in favor of the return to approximate mean periods. So, while we may be justified in commencing observations even from sunrise, October 12, so as to leave no chances to see the commencement of the transit, it is quite possible it will not commence before 10 to 11 A. M., October 13th. In the event of the re-discovery it will at once confirm the Leverrier hypothesis and Wright's observations, Oct. 24, 1876, and, of course, be peculiarly gratifying to myself, having devoted considerable time to the inquiry. In either case the Pacific ocean, Honolulu, and even farther west, affords the only chances for seeing the whole of the transit, if of long duration. Sydney and Hong Kong and Japan are still better. I am glad to add that Charles F. Crocker, Esq., Vice-President of the Occidental and Oriental Steamship Co., has given instructions to his officers, to take such observations as are practicable on the ocean, according to my recommendations; and I trust that the Pacific Mail Steamship Co. will do likewise. The Royal Mail Steamship Co. may also render some service, as their ships will have the advantage of later sunsets than San Francisco or San Bernardino, as regards latitude. The Navies of all nations which have received instructions about the transit of Mercury, Nov. 7, 1881, might also render good service October 12th and 13th, regarding Vulcan. I have written and expect shortly to hear from Washington.

Very Respectfully,

A. F. Goddard.

Sacramento, August 6, 1881.

Mexican Duty on Machinery.

The Tucson *Daily Star* of July 29th, has the following very applicable remarks on the subject: "It has several times been announced that an effort is being made to have the Mexican Congress pass a law imposing a duty on American mining machinery. This agitation has its source with the large foreign element throughout the Mexican Republic, and is designed to discourage not only American emigration but American machinery. Mexico could not pass a law which would produce more suicidal results to her fast advancing prosperity, and at the same time cementing that friendly feeling between the two republics which should be fostered at any cost.

Mexico has her mines of gold, silver and copper, the United States has the capital and the mechanics to manufacture the machinery necessary to develop her great wealth. There should be a reciprocity of trade as well as reciprocity of friendship between the two republics on this American continent, and in everything there should be co-operation. No foreign power will ever be allowed to molest or interfere with our sister republic as long as the Government of Washington is perpetuated on our soil. Then why should our neighbor take counsel with foreigners whose form of government is diametrically opposed to theirs? Why then listen to words which tend to sow bad feeling between governments which are republican in form and spirit? We would like to see free trade in the broadest sense of the term between the United States and Mexico as fully as now exists between the several States of the American Union. Such a system would bring about the grandest results in the development of the prolific wealth of both countries. The advantages would be mutual to both people. We look forward to the day when free trade will be declared by both governments. It is to be hoped that our Mexican neighbors will set their hearts against the attempted foreign interference with that which is the very bone and sinew of the monetary success of the Mexican Republic.

Wood River's First Smelter.—The Wood River Smelting Company started up their furnace, near this city, at 11 o'clock last Monday night. At 3 o'clock Tuesday morning it was charged; three hours afterward the first bar of bullion was made, and by 7 o'clock last night, 43 bars were stacked up outside the works. Since then the output has averaged five bars per hour. The bullion is of a much higher grade than that of the first run. The ores run through are from the Star mine, two miles south of this city, the Fearnaught, about a mile west of here, the Carrie Leonard, in the Smokey district, and the Elkhorn, near Ketchum. About 350 tons are on hand at the smelter, and a supply sufficient to keep the smelter going is contracted for. The same is the case with the fluxes and charcoal. Of the latter alone over 100,000 bushels are contracted for. A car load of new bullion will be shipped to-morrow or Friday, and other car loads will follow in quick succession.—*Wood River Times.*

MECHANICAL PROGRESS.

New Applications of Electricity.

There can be no mistaking the evidences which are everywhere multiplying, that electricity is soon to become a most important factor in nearly all industrial enterprises. The latest announcement of the practicability of storing electric energy in large quantities, for any length of time, and carrying it to any distance opens quite a new and wide field of research, which will doubtless be worked with all the energy and skill which is so characteristic of the present time, and the present generation of thinking workers.

It is now stated that the electric railway, which was recently opened with much ceremony and *eclat* at Berlin, has proved so satisfactory that a second is projected for another portion of that city. The cost of construction is comparatively small, it is only about $60,000 per mile, which is not considered large considering the advantages it possesses over horses or steam for suburban travel.

And now we have the announcement of the practical application of this agent for brake service upon railroads. The Cincinnati *Commercial* of a late date, says that an electro-magnetic brake has been successfully applied to a train of cars on one of the railroads leading out of that city. The invention is by a Cincinnati man, and consists in an iron drum about 18 inches long and 9 inches wide, placed on one axle of each car. Inside of this drum is an iron spool wound with wire, and connections made through the train by wire, all of which is carefully insulated. Electricity is generated in a dynamo machine placed on the locomotive, and is carried back by the wires to the spools on the axles, which, becoming magnetic, attracts bars of iron to it in such a way as to cause the iron drum to revolve with the axle. This winds the chain of the brake around the drum, and sets the brake on the wheel. The amount of electricity for each drum is carefully regulated to about correspond with the power of an ordinary brakesman, the idea being simply to supply a magnetic brakeman, as one might say, instead of man power. The initial power is increased as many times as may be required by means of a peculiarly constructed differential wheel, the increase of power depending solely on the diameter of this wheel. A train, consisting of a locomotive tender and three freight cars, running at the rate of 18 to 20 miles an hour, was stopped repeatedly without difficulty by the application of the brake, without using any brake on the locomotive or tender.

The English *Journal of the Society of Arts*, as well as many other journals and writers seem to be impressed with the idea that we shall soon be able to practically convey power to a distance by electricity, and give it forth again when and where required, at a very small loss of the power originally employed. When that time comes, if it ever does come, we shall have the means of utilizing at convenient points, the almost endless powers of nature which are now utterly wasted in distant and desert places. All around England the sea ebbs and flows an average of about 15 ft., with a power which, under the proposed employment of electricity, might furnish as much power, and at a vastly cheaper cost, than is energized by all the hundreds of thousands of stationary steam engines in constant daily use in that busy hive of industry.

We have already been accustomed to calculations as to the enormous amount of power which might thus be turned to profitable account at a single point in our own country—at Niagara falls. With such possibilities in the early future, what may we not expect from a proper utilization of the vast reservoirs of snow and water which are annually deposited along the extended ridges of the Sierra Nevadas. If wires can be so trained as to bring down to the ocean at moderate cost, the mighty powers developed by our mountain rivers, who can depict the wealth that would flow into San Francisco through a utilization of that power for manufacturing industries? We have already, in these columns, shown the decided advance which has recently been made in the substitution of electricity for gas in the production of light.

Again, the *Journal of Arts*, already quoted, speaks, of the substitution of electricity for coal in another direction. That Journal says: "We by no means despair of hearing that it (coal) is no longer needed directly, even for these operations, (metallurgical), for it is beginning to appear that electricity is able to do that in the way of melting refractory materials which has hitherto been done by the expenditure of fuel.

It has been stated on good authority that a copper wire of only half an inch in diameter would suffice to transmit 26,000 horse-power, as developed by a water-wheel, losing only 20% in a distance of 300 miles. The prime cost of the conductor would not exceed $15 per horse-power, for the power actually delivered at the distant station. This is on the authority of Sir William Thompson, of Scotland, the most distinguished electrician in the world.

PROF. BAUSCHINGER has lately tested some iron taken from a chain bridge built in 1829, and found that after 50 years of service its strength and elasticity had not altered perceptibly from what they were reported to be at the time they were put into service.

ELECTRIC TRANSMISSION OF POWER.—When examined before the Select Committee of the House of Commons on Electric lighting, in May, 1879, Sir Wm. Thompson gave an estimate of the quantity of copper conductor that would be suitable for the economical transmission of power by electricity to any stated distance; and, taking Niagara as example, he pointed out that, under practically realizable conditions of intensity, a copper wire of half an inch diameter would suffice to take 26,250 horse-power from water-wheels driven by the fall and (losing only 20% on the way) to yield 21,000 horse-power at a distance of 300 British statute miles; the prime cost of the copper amounting to $300,000, or less than $15 per horse-power actually yielded at the distant station. This reference to Niagara as the natural and proper chief motor for the whole of the North American continent has caused the idea to be erroneously attributed to Sir William Thompson, who now himself hastens to correct this impression. He says that he values the allusion too much to let it pass without pointing out that the credit of originating the idea and teaching how it is to be practically realized by the electric transmission of energy is due to Mr. C. W. Siemens, who spoke first on the subject in his presidential address to the Iron and Steel Institute, in March, 1877. Sir William spoke on the subject in support of Mr. Siemens' views at the Institution of Civil Engineers a year later.

SUN POWER.—The *Echo* states it is not impossible that before our coal fields are exhausted, we shall have discovered some means of doing many things without that, at present, invaluable fuel—at least, in regions where the sun shines. We have previously given an account of M. Mouchot's solar engine, but that extraordinary method of utilizing the heat of the sun has been eclipsed by an improvement devised by M. Pifre. It is stated that the latter has gone so far as to utilize 80% of the available heat of the sun's rays at Paris, and has actually constructed an apparatus with which he pumped water to a hight of 10 ft. at the rate of over 20 gallons a minute. As in Monchot's solar engine, a reflector receives the light and concentrates it upon a boiler, in this case containing nearly 90 gallons of water, which, under a clear Paris sky, begins to boil in about 40 minutes, and in a few minutes longer has sufficient pressure to drive the engine working the pump. In the not distant future, then, tropical countries will be the places where motive power can be had for next to nothing.—*Journal of Applied Science.*

FRICTION.—A large portion of the friction of engines is the result of tight cylinder packing. In setting out packing it should be only tight enough to keep the steam from passing. It is best to do this job by degrees, setting out the rings a little, and then blocking the crosshead, and testing by allowing steam in the crank end of the cylinder. When no steam passes, the rings are tight enough. In cylinders that have run for some time it is impossible to make a piston tight without re-boring. Care should also be exercised in making a complete revolution of the engine by hand after setting out the rings, to see that the packing does not stick in any of the smaller portions of the cylinder. An engine that requires constant lubrications in the cylinder to prevent "squeaking" needs attention, as generally the rings will be found too tight, or the cylinder out of line.

SALT AS A LUBRICATOR.—When a wire rod of iron or of steel is immersed in a hot solution of common salt, allowed to remain long enough to bring the metal to the temperature of the brine and withdrawn, the surface of the rod is irregularly covered with deposits of crystals of salt. These crystals adhere to the rod with great firmness, in consequence, doubtless, of a thin film of ferric hydrate which is formed between them and the rod as the water dries off. The rod can now be reduced by successive passes through a die or draw-plate, without any abrasion of the die. The economical advantage of this novel lubrication of wire is at once apparent, and the principle involved in it is interesting.

NICKEL PLATING BY BOILING.—Dr. R Kaiser, of Germany, prepares a bath of pure granulated tin tartar and water, which he heats to the boiling point, and adds a small quantity of pure red-hot nickel oxide. A portion of the nickel is soon dissolved, as is shown by the green color assumed by the liquid which stands upon the grains of tin. If articles of copper or brass are plunged into the bath they become covered in a few minutes with a beautiful white, silvery metallic coating, which consists almost entirely of pure nickel. If a little carbonate of tartrate of cobalt is added to the bath, a bluish shade, either light or dark, may be given to the coating, which becomes very brilliant when it is properly polished with chalk or with dry sawdust.

LARGE STEAM ENGINES.—Monster steam engines seem to be one of the features of the day. The Centennial engine, in Machinery hall, Philadelphia, was considered a monster in size and power. It is rated at 500-horse power. They are now putting up a 2,000-horse power engine for the Providence Water Works. These are very large for stationary engines. But engines of much larger power have long been in use in ocean steamers. There are now several trans-Atlantic steamers which develop from 4,000 to 5,000-horse power; but the Mail Cunard steamer service will develop 10,000-horse power.

SCIENTIFIC PROGRESS.

A Phosphorus Microphone.

In his photophonic experiments, Prof. James Blyth, of Edinburgh, was led to construct a useful form of selenium cell by dovetailing two brass combs, having alternate teeth knocked out, and filling up the spaces between the interlocking teeth with the seleninm. A modification of this pattern is made by fastening a brass disk on wood, and sawing it across until it consists of radial sectors, which are afterward connected by selenium. While trying to use amorphous phosphorus in place of the latter substance, he found the phosphorus evolved a current which varied with the pressure on the phosphorus, and the idea occurred to him that a microphone could be made from it which would not generate its own electricity. He therefore took a shallow wooden box, having a brass bottom, and spread a layer of phosphorus upon it, a thin flexible brass lid covering the box and touching the phosphorus. Wires from a telephone were then connected to the metal top and bottom of the box, and on speaking into a mouthpiece directed to the thin brass cover, the words were distinctly reproduced. The varying pressure of the sound waves on the phosphorus established an undulating current, which, passing though the telephone, caused it to give out the original words. When a battery was included in the circuit, the sounds were remarkably clear and loud, and free from the grating which disturbs the carbon microphone. Prof. Blyth also finds that the cell, which is really a form of loose contact, operates as a receiver as well as a transmitter, and will of itself emit articulate sounds under the influence of the vocal current.—*Scientific American.*

DISCOVERY OF ANOTHER COMET.—Mr. J. M. Schaeberle, of Ann Arbor, Michigan, discovered, July 13th, a new comet, the third of 1881. In the telescope it showed a bright center and a clear though faint tail. It appeared in the northeast, in the constellation Auriga, not far from the point of appearance of the comet now passing out of sight. The new comet is rapidly increasing in brightness, and will continue to do so until about August 21st, when it promises to be quite conspicuous, certainly as a telescopic object. It will be nearest the earth about August 20th, a day or two after its perihelion passage, when it will be about 40,000,000 miles away. So far "the orbit presents no special resemblance to that of any known comet," the Harvard astronomers say, though Prof. Stone, of Cincinnati, thinks he finds in it a close resemblance to that of the great comet of 1337. It seems to be moving in a northerly direction. This comet will not go so far north as the recent one. We will be able to see it early in the evening in the west, and early in the morning in the east. It has something of a tail, which will grow more distinct. The comet is labeled "C," being the third comet discovered this year. The comet so recently visible near the polar star is comet "B."

"THE CRY OF TIN."—A faint sound is emitted by tin when it is bent. It has always been believed that this "cry of tin," as it has been called after the German, is peculiar to that metal. Mr. J. C. Douglas, however, finds that it is not really singular, and, being due to the crystalline structure of the tin, can be imitated with other metals of a crystalline formation. The reason why it is not generally observed with cast zinc or cast iron is that these metals break off short before they can be bent sufficiently to yield the sounds, while rolled zinc has its crystalline structure so far destroyed by the mill that it is not capable of uttering the cry when bent. If, however, a piece of rolled zinc be heated for a few minutes to a temperature somewhat below its melting point, the metal becomes much less tough, and its fracture decidedly crystalline. In this condition, it emits, on being bent, a cry like tin, but fainter. Cast zinc cannot be bent so readily; but if it be pinched between the teeth or with pliers, it emits the sound distinctly. The practical deduction from these experiments of Mr. Douglas is that if, as appears to be proved, the peculiar "cry" in question is due to the crystalline character of the metal, it may either alone, or in conjunction with the microphone, become an indicator of the crystalline texture of metal beams and of their fitness for a certain class of work.

CURIOUS PHENOMENA OF FLAMES.—Herr Holtz describes some curious phenomena of flames. For instance, two slender flames formed by unmixed gas issuing from fine apertures, unite fully if the burners are brought near each other and inclined a little; but on separating the burners, and again inclining the flames so as to meet, they only mix if the point of the one be brought to the foot of the other. The two bright luminous parts behave as if mutually repellent. When the flames are pressed together, so as to broaden, there is always a well-defined dark space between. The phenomena are perhaps (the author thinks) electric. Again, when two thin flames are crossed at a certain angle (25° to 30°), and about the middle, a peculiar red-glowing tube forms at the lower part of the oblique flame disk, being composed of carbon particles whirling circularly and spirally. The particles on one side whirl in an opposite direction to those on the other.

NO LIFE IN METEORITES.—An account is going the rounds of the papers to the effect that traces of organic life have been found in meteorites, and that hence the other members of the solar system are inhabited by living beings. It appears that Dr. Hahn has published an elaborate work, in which he claims to have recently completed a series of investigations upon some of the huge meteoric stones that fell from the skies in Hungary during the summer of 1866. Thin laminæ of these mysterious bodies, subjected to examination under a powerful microscope, have been found to contain coraline and spongeous formations, and to reveal unmistakable traces of the lower forms of vegetation. All the organisms, animal and vegetable, discovered by Dr. Hahn in the delicate stone shavings he has thus dealt with, indicate the condition of their parent world to be one of what is technically termed "primary formation." But the presence of water in that world is proven by the fact that the tiny petrified creatures revealed by the magic of the lens, one and all, belong to the so-called subaqueous classes of animals. They could not, therefore, have possibly existed in comets, at least if the assumption be correct that these are in a state of active combustion. The fact is, that this supposed discovery, about which such a pother has been raised, is no discovery at all, and the work of Dr. Hahn merely shows how utterly he has misconceived the character of the material which he has studied. The plates of his volume are beautiful, but they only serve to illustrate the mineralogical nature of the material. What he has supposed to represent coraline and spongiform organisms are in fact only concretionary forms which the common minerals of meteorites often take. These forms are well understood by mineralogists, have long since been described, and are to be seen in nearly all the stony meteorites. While we know that there are other worlds than ours, and while it is possible that they may support life in some form or other, there is, we believe, as yet no tangible evidence whatever that this is the case.

SUBSTITUTE FOR PLASTER OF PARIS.—German physicians and builders, after a series of practical tests, speak very highly of the properties of "tripolith," a substance manufactured to replace plaster of Paris for surgical operations, and for stucco plaster and other work in the building trades. It is manufactured by Messrs. Gebruder von Schenk, of Heidelberg, and is remarkable for the rapidity with which it sets, its lightness, strength and polish. It is said to resist the action of water very well. It is made of impure gypsum, three parts of which are ground together with one part of silicats of lime, niac parts of the mixture being ground together with ons part of coke. The material is then heated and stirred, without the addition of water, at a temperature of 248° F. As soon as the water of crystallization of the gypsum has been expelled, the temperature is raised to 500° F., the product being a gray powder. The color of the dry mass is silver gray, and besides setting in a pure state in four to five minutes, it can be made to harden after five to six hours by the addition of water in which some glue has been dissolved. By comparative test, it was found that after setting it took plaster of Paris 147 hours longer to dry than tripelith. The latter is also 14% to 16% lighter, an important advantage for surgical operations and for use in stucco work. After it has been given a coat of oil, it holds color very well. As it grows older, set tripolith becomes firmer. Tripolith is said to be 30% cheaper than plaster of Paris.

EFFECTS OF OPTICAL SLITS.—M. Treve has lately described some curious effects. Looking through a fine slit at a vertical object (a post or a mast, for instance), he finds the perception much more distinct when the slit is horizontal than when it is vertical. On the other hand, to distinguish horizontal lines more clearly, the slit must be held vertically. But if, in general, one look at a house or a landscape through a fine slit, it is found that the maximum of brightness of the horizon is when the slit is horizontal. This effect, it is said, is also produced with the solar and lunar disks; they are seen much more distinctly with the horizontal slit. M. Treve has reproduced the effect by photography, and the negatives taken with the horizontal slit were more distinct. The light appears to be propagated with more intensity through the latter than the former, the vertical bands of solar photographs showing well the interferences and passage of light through a vertical slit. Again, if a crose-slitted disk be held between the sun and white screen, the horizontal part of the cross on the screen is brighter than the vertical. The practical application of these experiments of M. Trevo to photography would appear to be the relation which they bear to the shape of the apertures of diaphragms and to instantaneous shutters. Is it a fact with regard to the latter, that the uncovering of the lens horizontally admits more light, and therefore produces a picture more quickly than a shutter which opens vertically? There may be no difference, but the point, at any rate, is worth deciding.—*Photographic News.*

WATER IN AN AMETHYST.—An Atlanta paper reports the recent finding, in Rabun county, Ga., of an amethyst bearing a drop of water or similar liquid in a cavity near the center of the stone. It is not an uncommon occurrence to find such water-filled cavities in crystals of quartz and other minerals, but this cavity in amethyst is said to be unique.

BAULKY ENGINES.—The engine of the elevated railway has a perfect right to take the "studs," and refuse to perform its little part in the fair programme, when its huge rivals of the outdoor world set the example. Last Sunday, the passenger engine on the S. F. and N. P. road run out of the Cloverdale depot to wood and water, preparatory to the return trip to the city. When this little chore was completed, she refused to return to the depot to take up the train. In vain did the engineer turn on the steam, swear and coax with words and crowbar hy turns; the monster only said cheeoocheeoo, and stirred not an inch. Another engine was then fired up, the refractory one pulled out of the way, and the excursion train started an hour and a half late, and arrived in this city an honr late. This road will either have to sell out to Villard, huy new engines, or hire oxen soon.

THE gross receipts for the fiscal year ending June 30, 1881, at the port of Wilmington, amounted to $31,500.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in Mining and Scientific Press and other S. F. Journals

The Mining Share Market.

The dullness in the stock market still continues, and one reason may he found in the fact that 33 assessments will become delinquent this month. These have been levied on account of 19 Nevada mines, 12 California and two Arizona mines. The two Arizona mines are the Northern King Mill, in Pinal county, and the San Pedro, in Cachise county. The *Bulletin* says:

As an illustration of the power of the Comstock mines to absorh money, we annex the following table, showing how much of the money collected for account of Nevada mines this year has gone into a single county in that State:

	Storey County Mines.	Total Nevada Mines.
January	$ 393,600	$ 563,600
February	583,400	633,400
March	159,900	204,900
April	755,450	885,450
May	345,800	517,800
June	357,000	440,810
July	80,000	227,500
August	870,800	918,300
Totals	$3,545,950	$4,391,760

It passes as a saying that Paris is France, and San Francisco is California. It is equally true that Storey county is Nevada in the matter of mining assessments, as over 80% of the money collected for that State is absorhed in that section. But it is probahly equally true that the same county has contrihuted over 80% of the bullion product of that State. The assessment money delinquent this month will be apportioned as follows:

Nevada—		
Storey county	$ 70,800	
Nye	32,500	
Elko	10,000	
Esmeralda	5,000	$ 918,300
California—		
Mono county	149,000	
Calaveras	10,000	
Nevada	10,000	
Placer	8,000	
Inyo	85,000	
Amador	3,000	265,000
Arizona—		
Cachise county	10,000	
Pinal	26,000	35,000
Totals	$1,218,300	$1,218,300

During the month of August, 1880, the amount delinquent was $1,233,200 on 33 mines, of which $856,200 was for account of Nevada, including $696,200 in Storey county, $207,000 for California, $100,000 for Arizona, $50,000 for Dakota and $20,000 for Mexico. The delinquent assessment roll for the first eight months of the year comparcs as follows:

	Mines.	Amount.
January	30	$ 780,500
February	20	880,400
March	29	417,400
April	39	1,068,450
May	28	678,800
June	29	754,810
July	30	579,900
August	33	1,218,300
Totals	247	$6,375,560
In 1880	319	9,191,700
In 1879	316	10,200,900

We are this year collecting only a little over two-thirds of the amount collected during the same period last year.

Bullion Shipments.

We quote shipments since onr last, and shall he pleased to receive further reports:

Ontario, Aug. 1st, $21,467; Barhee & Walker, 1st, $43,753; Hanauer, 2d, $24,450; Ontario, 2d, $5,314; Barbee & Walker, 9th, $2,075; Ontario, 4th, $45,225; Hananer, 4th, $2,500; Great Basin, 4th, $6,200; Ontario, 5th, $5,154; Stormont, 5th, $3,800; Germania, 5th, $6,300; Mayflower, 5th, $5,600; Horn Silver, 5th, $7,500; Ontario, 6th, $5,334: Hanauer, 5th, $2,350; Germania, 6th, $2,250; Great Basin, 5th, $1,600; Kesler, 5th, $1,400; Bodie Consolidated, 8th, $7,567; Syndicate, 3d, $6,866.50; Navajo, 8th, $4,000; Northern Belle, 3d, $5,779.38; Day, 3d. $2,550; Eureka Consolidated, 3d and 4th, $8,548.16; Northern Bslle, 6th, $8,143.88; Mount Diablo, 5th, $11,318.16; Independeuce, 8th, $3,400; Christy, 6th, $1,897.

A YEAR ago Humholdt lako waa so dry that horsemen could ride over its bottom without getting their horses' hoofs muddy It was then demonstrated, as it was supposed, heyond all question, that the lake had no suhteranean ontlet, and that it was dried up hy evaporation. Now the lake has spread out to its old size, and is larger than at any previous time in six years. Its waves heat against the railroad embankment at Brown's station, and its waters extend across the valley to the hills on the eastern side.

THE Metallurgical works at 318 Pine St., corner of Lsidesdorf, formerly owned hy Kustel & Riotte, now helong to G. Kustel & Co., Mr. Riotte no longer heing a member of the firm. Mr. Kustel's son still remains with him. At these works they have the experience and all the appliances for assaying ores and minerals, and testing ores in any desired way, by any process.

Mining Summary.

The following is mostly condensed from journals puhlished in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

AT WORK.—Monitor *Argus*, Aug. 6: Mr. Lewis Chalmers has a force of carpenters at work at the Exchequer mill, preparing leaching works for the reduction of the Morning Star ore, and will in a short time, we understand, have a force of miners in the mine getting out ore.

AMADOR.

SULPHURETS WORKS.—Amador *Ledger*, Aug. 6: Both the sulphurets works at Sutter creek are idle at present. The Lincoln Works, however, have suspended temporarily for the purpose of doing some necessary repairing. The Phoenix Works at Drytown are idle, and are not expected to start up before fall. The Bunker Hill and Zeile Chlorination Works are the only ones in full operation in the county at the present time.

BUNKER HILL.—The new shaft is making satisfactory headway, and the work of running drift keeps time with the deepening of the shaft. At the 400 level a drift has been run north a distauce of 250 ft. A few days ago this drift encountered a new ore body, 18 ft wide, and of great richness. It is estimated that this vast ledge will yield an average of $10 per ton. At the mill everything is running smoothly. The full 40 stamps are kept in motion with one of Knight's wheels, using 110 inches of water. Crandall's wheel, that was first tried, required 220 inches, and proved greatly inferior in every respect to the Knight wheel. The 3 processes of saving sulphurets—Hendy, Frue and Blatchley—have been practically tested at this mill, and the superiority of the Frue method satisfactorily demonstrated. The Blatchley machinery was stopped last week, and will be cast aside as a total failure. It does not answer as well even as the old method. The sulphurets works, operated in accordance with the new Mier's process, are giving excellent results. The sulphurets are worked by this process up to 97% of the assay value By the processes heretofore in vogue, 90% of the assay value is considered an unusually good yield. The mill turns out from 2½ to 3 tons of sulphurets per day, and the chlorination works are run only in the day time.

MEDIAN.—This property lies east of the Keystone. A few weeks ago it was bonded by O. C. Hewitt, Thomas Fleming and J. S. Hill for the sum of $5,000. They started in to develop the property, and worked on it for about a month. The shaft is 90 ft deep. There are 2 ledges, one 3 and the other 2 ft wide The quartz is of good quality, and will undoubtedly pay well. Last week, Messrs. Hewitt, Hill and Fleming sold their hond to a San Francisco company for $3,000. This sale was effected before the second ledge was developed. All the indications point to the development of a valuable mine on this property. Three men are employed crosscutting.

CALAVERAS.

RICH ROCK.—Calaveras *Chronicle*, Aug. 6: We are informed that several men with riding horses and 2 pack animals are traveling over the country prospecting quartz, and supposed to be in the interest of French capitalists. These parties found some rich rock near the head of the Esperanza creek, near the wagon road between Railroad Flat and El Dorado. They sunk a shaft some 6 or 8 ft in depth, and struck a vein of quartz about 3 ft in width, and rich with gold. The parties are busy at work, and think they have a good mine.

EMPIRE CITY MINE.—We hear very flattering reports of the prospects in the Empire City gravel mine in Old Woman's gulch. Some very fine gravel has been struck, which pans out well. There is every indication that this mine is going to turn out to he a very handsome paying property. The gravel just found, it is estimated, will pay $3 to the carload—a carload containing about 60 pansful of gravel. The hottom of the channel is not yet reached, and it is reasonable to expect richer dirt farther down.

A GRAVEL MILL.—A 5-stamp gravel mill—with means for donbling the number of stamps if necessary—is in course of construction on the Corral Flat mine. Work is progressing to that extent that it will not be long before the mill is completed and will he put in operation. The work of putting up the mill is under the direction of Mr. John Steele, a first-class millwright, and that the work will be properly done is a certainty. The mine is looking fine, as work is being rapidly pushed ahead. When the mill is set to running, we have no doubt at all but that the Corral Flat mine will give a good account of itself, for we are told that the gravel prospects splendidly, and there is lots of it. It is well known that a heavy hed of gravel underlies the whole flat. A great amount of gold has been taken out of it in former years. In fact, it has the reputation of having been one of the richest gravel beds in this vicinity. And as the gravel which has been taken out is but a mere fraction of what is known to remain, it is reasonahle to suppose that a vast amount of auriferous matter still lies imbedded in this deposit.

GLENCOE ITEMS.—The big mill in Valentine gulch is progressing finely. The building is covered, and carpenters are working on the batteries. The company is taking out ors to have it ready for crushing when the mill is completed. The Longly mill will soon be repaired, and will probably be started to crushing as soon as it is ready. Lewis & Fairchild are busy every day taking out rock that would make even an editor envious—could he see it.

EL DORADO.

COLOMA.—Cor. Georgetown *Gazette*, Aug. 3: The Chinamen are showing considerable enterprise; on this side of the river they have put in a wheel and pump, and are working the channel near the bank, and have struck some very good looking gravel—new ground—while on the north side they are building an extensive race for working the present river channel.

THE GOPHER-BOWLDER MINE.—*Mountain Democrat*, Aug. 6: The new mill at the Gopher-Bowlder mine is about completed, and 10 stamps will be set in motion next Monday. The underground work has fully kept pace with the building operations. The tunnel running west from the mill toward the main Bowlder ledge reached the banging wall at a distance of 70 ft, and has tapped a body of fine ore. At this point it is fully 70 ft across the ledge from the hanging to the foot wall. The other tunnel, which is being run northwesterly from the mill to connect with the "Slip incline," has been driven over 200 ft, and is making rapid progress. The distance to the incline is about 1,300 ft, at which point the new tunnel will tap the ledge about 75 to 80 ft below the old workings, which have been cleaned out and timbered, and the ore found to be of high grade, of which there is not less than 5,000 to 10,000 tons in sight. New track has been laid in all the tunnels. Over 4,000 ft of pipe has been laid to connect the mill with the source of water supply, and on the whole there has been a tremendous expenditure of energy and a vast amount of systematic work done on that property within the last 3 months. And next Monday the mill will begin to "chaw quartz."

STARTED UP AGAIN.—Crushing was again commenced last Tuesday in the Placerville gold quartz mining company's mill, and we understand that they are crushing better ore than has ever before passed through that mill.

BIG CONTRACT.—The fore part of this week, L Landecker closed a contract for the delivery of 100,000 lbs of supplies at the Mount Pleasant mine, Grizzly flat, where preparations are in progress for a big season's work.

INYO.

PANAMINT.—Inyo *Independent*, Aug 5: A letter states that G. M. Pinney is out from New York completing a consolidation of all the important Panamint interests. The Pheby & Anthony lease of the mill has expired, but we believe they intend making another run. The last shipment of bullion amounted to some $11,000, instead of $0,000 as stated. The canyon road, which cost the Surprise Valley company some $6,500 to build, was covered by the water spout with rocks from 4 to 10 ft deep, and it

will cost some $5,000 to restore the road in as good shape again.

A New Discovery.—A fine vein of silver ore has been discovered in the Beveridge district. Two assays of the ore, made by Mr. Woodhull, show respectively $457.08 and $494.82 per ton in silver.

Lookout.—Frank Fitzgerald has a force of men extracting ore from No. 4 tunnel and the long tunnel of the Modock mine. He expects shortly to fire up the furnace, working the ore taken out, rich flue dust and slag.

Returned.—Gomer Jones, the well-known miner and prospector, has returned to Panamint from a trip to Mexico. He gives a bad report of that country generally, as to its mines and all kinds of business. Mr. Jones is about making his fourteenth trip to the Death valley country, still in search of the "Breyfogle."

Taking a View.—S. H. Moore has been making an examination of the Beveridge gold mines, and is now at Cerro Gordo looking over that district.

At Darwin.—The Defiance furnace was to have started up for a short run on the 1st inst.

Mine Bonded.—Mr. G. Gray, who has spent some time in examining the prospect around Bishop creek, has bonded the Ross & Page mine—time and terms not stated. The Ross & Page is a very promising looking ledge, the croppings showing a width of 30 ft, with stringers of fine silver ore running through it.

MARIPOSA.

Diltz Mine.—Mariposa *Gazette*, Aug. 6: In a shaft recently sunk about 20 ft deep, near the old works where the mine was opened when it was first discovered, a rich body of ore has been struck, and free gold can be seen letting out all through without the aid of a glass. We had the pleasure of seeing about 20 lbs. of the rock, taken from the bottom of the shaft, and it appears as we have stated.

MONO.

Up from Benton.—Bodie *Free Press*, Aug. 7: John F. Keating arrived in Bodie from the Benton country on Wednesday morning. He has been engaged in sinking a fine double-compartment shaft for the Tower mine, located about 8 miles from the town of Benton. At a depth of 150 ft water was struck, and sinking must be suspended until machinery is got in place, which will be done at once. The shaft is being substantially timbered, and the work is of a permanent character. The Tower is a rich mine, and ought certainly to do as well if not better than its neighbor, the Indian Queen.

The Fating Pan Mines.—Bridgeport *Chronicle*, Aug. 6: The interest in the new Mono mines, in the Sweetwater district, is steadily increasing, and scarcely a day passes that parties do not pass through Bridgeport on their way to those promising mines. This interest has been greatly enhanced by the cutting of a 2-ft vein of exceedingly rich ore in the tunnel of the Summers' claim. We have been unable to obtain the full particulars for this issue, but we are assured it is a rich strike.

NEVADA.

To be Worked.—*Foothill Tidings*, Aug. 6: It is stated, on what we call good authority, that the old Allison Ranch mine will soon be worked again. Eastern parties are about to take hold of the property. When the Allison Ranch shut down the last time (it has done so twice), there was very rich ore in the Carlton ledge, which is a tributary over the main ledge. There are undoubtedly millions of dollars in that mine, notwithstanding millions have been taken out of it. It is also probable that the North Star, which unit with plenty of pay quartz in the ground belonging to the property, will resume operations before many months. The contractors in the Ford & Mullen mine did very well with their work. After 60 days' work the contractors were enabled to distribute to each man of them the sum of $1,003, or $10 17½ per day. The trustees of the Idaho mine met last night, and with the same regularity that characterizes the rising of the sun, declared the 144th dividend to the shareholders of the company. This dividend is $7.50 per share. The production of the mine for the past month was, in round numbers, $42,500.

A Good Little Mine.—*Transcript*, Aug. 9: The Omega quartz mine, comprising 1,500 ft along a ledge in Willow valley, and supposed to be the eastern extension of the Deadwood, is making a good record. It is owned by Messrs. Johnson & Gagen. The former gentleman recently leased his interest to Mr. Toward, who, with Mr. Gagen, has during the past 4 weeks taken out 21 tons of ore above water level. They had it crushed at the Deadwood mill, and yesterday morning brought in the clean-up, which amounted to a little more than $20 a ton. The work on the claim has thus far been done by means of a whim. With machinery to enable operations below the water level it is believed still better profits could be obtained.

PLACER.

Poole.—Placer *Argus*, Aug. 6: The Poole M. Co. are meeting with flattering success in the work of prospecting their quartz claim at Humbug canyon. About 12 men are employed there now, and for some time past. They work day and night shifts. One tunnel is now in about 100 ft, another, lower down, about 70 ft. The mine is about 7 miles distant from Alta, and it is located on the south side of the South Fork of the North Fork of the American river. The company are interested in 3 other claims situated near the Poole mine. One of these is a ledge farther up the river. It is operated by the Dorer Bros., Richard and Leopold, and from them it takes its name, the Dorer ledge. There are 2 tunnels also in this mine, each of which is from 50 to 60 ft in length. One hundred and fifty tons of good rock has lately been crushed from this mine, also with good results.

PLUMAS.

Monte Christo.—Oroville *Mercury*, Aug. 6: William Allstrom, the manager of the Monte Christo mine, passed through this city Monday on his way to the mine. Mr. Allstrom is probably the most extensive mining operator in Plumas county. He has expended over $200,000 in developing the Monte Christo, and the amount of work accomplished is something remarkable. The methods adopted by him in operating this valuable property are complete in every detail. While in Oroville he purchased a steam sawmill. Mr. Allstrom is also manager of the Big Bend mine.

SHASTA.

Wilbourn Con.—*Mountain Messenger*, Aug. 6: Work on the mine has been suspended for the present. The shaft is down 204 ft from the surface, in fine quartz gravel and sand, interspersed with large bowlders. Operations will be resumed as soon as the stockholders determine on the best course to pursue.

Black Jack.—We learn that no work is being done on the Black Jack mine at present. The Supt. left some time ago, and no one has yet offered to take his place.

Prospecting.—A company from Oakland, superintended by Dr. Draper of that place, is prospecting for an extension of the Rainbow ledge between the Golden Star claim and Cold spring, on the north side of Kanaka creek.

Coonyear Bar.—The mines hereabouts generally pay well for these times, and occasionally a rich strike reminds one of the pans of gold of the never-to-be-forgotten days of '49.

SISKIYOU.

Dams.—Siskiyou *Journal*, Aug. 6: The French company, below Oak Bar, have got their dams in, and are now down some 10 ft, and are at present taking out lots of "filthy lucre." The rest of the claims below have all good prospects for a good season's run, as the river is reported as going down fast.

TRINITY.

Looking at the Mine.—Trinity *Journal*, Aug. 6: Mr. Thos. R Watson, of the well-known New York broker firm of Watson & Gibson, and Mr. I. M. Taylor, mining engineer, of San Francisco, passed through here last week on their return from a visit to the Taylor Flat mine, in which they are interested. Both gentlemen speak enthusiastically of the appearance and prospects of the mine. They were accompanied by Geo. R. Gibson, Esq., who goes to San Francisco on a brief visit.

Contract Let.—Jos. Falan has taken a contract to extend the Bullychoop and Occidental tunnel 100 ft, unless the lode is struck in a shorter distance. A survey indicates that it will take 70 ft to strike the ledge, providing it goes down perpendicularly. Otherwise "you never can tell." Mr Falan has gone to Bullychoop and will commence work at once.

Flume Robbery.—Some industrious person or persons went into Holman & Co.'s flume one night this week and cleaned up 12 boxes thereof. As Holman & Co. had themselves cleaned up the flume only a few days previously and had not run any since, it is probable the would-be robbers did not realize very handsomely. Our informant says this robbery of a flume which has already been cleaned up may be regarded as a sure sign of a hard winter.

NEVADA.

WASHOE DISTRICT.

Sierra Nevada.—*Enterprise*, Aug. 9: A station is being cut out at the 2700 level of the joint east Union cut, winze. Have completed repairing east crosscut No. 1 on the 2500 level, and have extended east crosscut No. 2 30 ft. Are easing timbers in the main north lateral drift. On the 2700 level the joint Union Con. east drift 1 ole No. 1 from the station has been extended 90 ft, and drill hole No. 2 has been advanced 10 ft. Are taking out the main pumps and cleaning out the shaft.

Ophir.—The station at the 2900 level of the joint Mexican east winze has been completed. The joint California east winze has been sunk and timbered 14 ft. Are repairing steam pipes.

Utah.—During the past week the incline has been sunk and timbered 12 ft. The ground in the bottom is very hard. A crosscut west has been started from the north drift on the 400 level.

Alta.—During the past week we have sunk and timbered the shaft 10 ft; total depth, 2,158½ ft. Have put in the 2150 station set and are now sinking for the sump. A broken gallows-frame sheave delayed us 24 hours.

Mexican.—The joint Con. east winze has been sunk and timbered 8 ft. The station at the 2900 level of the joint Ophir winze has been completed. The main north lateral drift on the 2700 level has been extented 15 ft.

Union Con.—Are cutting out a station at the 2700 level of the joint Sierra Nevada winze. The joint Mexican east winze has been sunk and timbered 8 ft. On the 2700 level east drill hole No. 1 has been extended 90 ft, and east drill hole No. 2 has been advanced 10 ft.

California.—During the past week 64 tons and 1,000 lbs of ore, assaying $——per ton, have been extracted. On the 2500 level the joint Ophir winze has been sunk and timbered 14 ft. Also, have completed the station and commenced sinking the joint Con. Virginia winze. The south drift from the bottom of the C. & C. shaft (for a sump) has been completed.

Yellow Jacket.—The east drift on the 3000 level has been run 34 ft since last report, making the face of the same 315 ft from the shaft. We are making preparations to resume sinking the same to the 3000 level, or about 140 ft on a slope of 45 degrees. During the week we have been employed cleaning the sump and placing a second 14-inch pump and column at the 300 station, which, when completed, will give us a double line of 14-inch pumps from the sump to the Sutro tunnel level.

CANDELARIA DISTRICT.

Northern Belle.—*True Fissure*, Aug. 6: The shaft levels are looking well throughout, particularly the intermediate between the 1st and 2d levels. In running a crosscut in new ground on the 1st level, a body of ore has been opened which is 20 inches in width and looks quite promising. The 10th and 11th levels are showing very well. The ore vein on the latter widened on Sunday, and the outlook there is quite encouraging. All the levels above the ones mentioned present about the same appearance, and are yielding as usual. There are being extracted and sent to the mills about 85 tons of ore per day. The shipment of bullion for the week ending Aug. 3d was $30,896.79, and the total on August account was $37,964.88.

Mount Diablo.—A 2 months' run upon ore from this mine was finished yesterday at the mill of the Northern Belle company. No ore is being extracted now except such as is necessary in the work of prospecting. The winze at the bottom of the mine looks well. Bullion amounting to $8,001.78 was shipped on July 29th, and $10,032.66 on Aug. 2d.

Gen. Jackson.—The work of development is progressing slowly but steadily on this mine. Only 4 men are working. The force will be increased very greatly as soon as the mine is put in condition to work to advantage. A little ore is being taken out all the time.

Holmes.—The main tunnel has been advanced during the week 18 ft. A station has been cut, and a winze started and sunk 8 ft. The formation in the winze is good working ground, and rapid beadway may be looked for.

CRABB DISTRICT.

Rich Strikes.—Esmeralda *Herald*, Aug. 6: For some time of late a few persons have been at work on claims in Crabb mining district, situated about 5 miles from the crossing of East Walker, toward Walker lake, on the old Wellington and Reese River road. Last week some of the richest quartz we have seen for some time was sent us from several ledges in the new district, the quartz being literally covered with coarse gold. The ledges vary in thickness from 18 inches to 6 ft. The quertz very much resembles that of Mill creek, and is fully as rich. For the emount of work done the claims show very good indeed. The district is about 2 miles from the East Walker river, which would afford a splendid opportunity for milling the ores at a very low figure. There are only about a dozen claims located as yet, but inside of a month there may be a live mining camp of several hundred men.

DESERT DISTRICT.

At Work.—*Silver State*, Aug. 8: We are informed that there are from 25 to 30 men at work in Desert district, about 6 miles from the Desert Crystal Salt Works at White Plains. The Churchill mill and mining company are running their 6-stamp mill steadily on ores from several mines which they own in the district, and the yield is said to be satisfactory.

ESMERALDA DISTRICT.

Cortez.—Esmerald *Herald*, Aug. 6: Owing to the death of Henry O. Clark, who represented the company of New York capitalists, the Cortez mine has been shut down for a few days, consequently the progress for the past two weeks falls off a little, compared with the same period of time prior to his death. The other mines in the district are looking as well as usual. There are several new districts in the county from which are flattering reports, and never in the history of Esmeralda county have mining matters had such a prosperous outlook.

The Centennial.—The incline of the Centennial has been driven down 230 ft. The ledge in the bottom of the incline is showing much better than at any other point in the mine.

The Humboldt West.—Drifting still continues, and every stroke of the pick shows the Humboldt West to be one of the largest and most regular ledges in the State. A 20-stamp mill on this property would turn out bullion that would pay a handsome interest on the money invested. The smaller mines at work are looking about as usual—good prospects.

EUREKA DISTRICT.

Strike.—*Sentinel*, Aug. 8: The *Sentinel* is informed that an important strike was made in the Kit Carson mine a few days since. About 3 ft of solid galena ore was encountered, giving assays as high as $200 per ton. The development was made in the deepest workings.

MARIETTA DISTRICT.

New Ledges.—Esmeralda *Herald*, Aug. 6: There have been two ledges found about 4½ miles west of Marietta. The one owned by W. N. Cook and J. C. Melring has been very well tested. They report having shipped 10 tons to the Lyon Mill Co., at Dayton, and the returns showed nearly $500 per ton. About 1 mile from this mine is another one of the same character, owned by Schofield & Co. Cook & Melring are at work on their mine. Geo. W. Grayson is talking of starting up the old Endowment mill if not sold very soon.

ARIZONA.

Carrie Copper Mine.—*Arizona Journal*, Aug. 5: Messrs. Erland & Stargis, who came out from New York about the first of the year to assume control of the Carrie copper mine, in Globe district, have pushed work with great energy and spirit. A shaft has been put down 135 ft, all in ore. Tunnel No 1 has been run into the hill 265 ft on ore. Tunnel No. 2 is in 165 ft. There is now 200 ft of stoping ground. The smelter is all ready to start up. Hauling of ore from the mine to the smelter was commenced July 28th, and in a short time the Carrie will be recorded as one of the bullion-producing mines of the Territory.

Copper Shipments.—The Copper Queen mine shipped during the month of July 150 tons of bullion. This is less than the usual monthly shipment—the heavy rains having made the roads almost impassable. There has been a material falling off in the price of copper bullion in the market. It is said the shipment from Arizona will be materially diminished unless the price of copper advances. The Clifton Copper Co. have determined to stop shipments, owing to the low prices prevailing. The Copper Queen will doubtless do the same until prices enhance. The copper companies prefer to hold their bullion rather than sell at the present prices.

Hermosa Mill Running.—The recent heavy rains caused very material damage to the town of Harshaw. The flood from the watershed of the Patagonia mountains came down like a torrent, flooding stores and doing material damage in all directions. The Hermosa mill is now running at full capacity, having an abundance of water and ore. This mill has been running only at half capacity for some time previous to the recent rains, on account of the scarcity of water. Mr. Corrington Johnson, the efficient superintendent, has largely increased the number of employees, thereby giving new life to things about town. Our informant states that everything is looking brighter at Harshaw.

Shut Down.—Tombstone *Epitaph*, Aug. 5: The Girard shut down this morning, pending the test for water in the Sulphuret and the uncertainty of where the mill will be built—at the mine or on the river. The extraction of ore is not a money-saving operation under the present conditions. If the mill is to be built at the mine it will stand higher up than the ore dump now is and will all have to be hauled up the hill. If the mill goes to the river then a regular dump will have to be built, with automatic spouts to empty into the ore wagons. The suspension will only be temporary, hinging entirely on the water supply from the Sulphuret mine, which will be thoroughly tested as soon as the pump gets out of the mud between here and Benson.

Connection Made.—*Silver Belt* (Globe), Aug. 3: The connection has been made between the central and southern shafts on the South Pioneer, at the 70 level. The ore taken out in the drift is a sulphuret, with wire silver all through it. The last average assay from the ore breast, just before the connection was made, was $370.75. The Pinal mountains are seamed with veins of quertz carrying gold. Following the line of the road to Bremen's mill innumerable quertz veins cross it. On one of these locations have been made. The Hawkins mine, just beside the road has a shaft on it 60 ft deep, with a well defined ledge the whole depth, with free gold showing in it. This property is owned by Eaton & Slauchman, and, if it keeps its present showing, will become of great value, owing to its close proximity to wood and water. M. Whelen has some locations on the same ledge that show well, and from which free gold has been taken. On the south slope of the mountains the ores generally are silver. Work is progressing rapidly on the Old Dominion Co.'s mines. We are informed that there is an abundance of ore in all the openings. We continue to receive favorable reports of the Nugget. There is a steady improvement in the north drift. Mr. Lennon leaves within a fortnight for New York. Night and day shifts are at work on the Globe copper mine—an extension of the Old Dominion—and the developments are satisfactory.

Tombstone Bullion.—*Epitaph*, Aug. 7: Much to the regret of everyone, the severity of the storms during the greater portion of the last half of July so obstructed the delivery of ore to the mills, besides carrying away the dams and injuring the ditches along the San Pedro, that much valuable time was lost by the mills, which necessarily shortened the bullion output by about $75,000 what it was for June. Had it not been for these unfavorable incidents the yield would have overrun that of June by nearly an equel amount. Our estimates to-day will be only approximate, as full returns have not been received—the final clean-up at the mills not having yet come in. However, the final reports will not vary above or below but a few thousand dollars, which will not materially affect the general result. The following are the productive mines: Tombstone M. & M. Co. (no clean-up), $143,268.50; Contention, July 26th (official), $92,403.33; Contention (estimated) balance month, $16,000; Grand Central (estimated), $100,000; Head Center, July 24th (official), $10,121. Head Center (estimated) balance month, $6,000; Vizina, $50,000; total, $432,832.83. For June the same mines yielded as follows: Contention, $130,000; Grand Central, $125,000; Head Center, $28,353; Tombstone M. & M. Co., $157,553; Vizina Con., $36,500; total, $479,406; add product for July, $432,832.83; difference $44,573.17; add product Boston mill for June, $54,000; shortage for July, $98,576.17. From this apparent shortage we have to credit the Boston mill with several thousand dollars, or enough to reduce the falling off to $75,000 or less. The gain between this and the first of January next will be sufficient to make the year's product fully $6,000,000, or an average of a half million per month.

COLORADO.

Yield.—*Register-Call*, Aug. 5: Mr. G. W. Barrett brought over yesterday from the Rollins stamp mill at Gold Dirt, 44 ounces of gold retort, the yield of 6 cords of ore—an average of 7⅓ ounces per cord. This ore came from the Perico lode.

Hatch & Schaffer, owners of the Star of the Mountains, have purchased the lease recently given by them on that vein to Oahlger & Co., and will hereafter develop it under their own management. A shaft building and California whim is to be placed over the main shaft.

The Bohtail G. M. Co. left at the Rocky Mountain National Bank last evening a gold retort weighing 440 ounces of gold, which, at $17.60 per ounce, would have a currency valuation of $8,762.90. The retort was the result of an eight days' clean-up from 100 stamps. This is one of the largest yields received from any mine in Gilpin for months, for that length of time.

Mining and Milling Items.—Sinking has been resumed in the Prize mine, Nevada district, worked by J. W. Bostwick & Co., and a level west is being driven at a depth of 400 ft. W. J. Lewis & Co. have removed the machinery from the Lewis lode, on quartz hill, to the Manitoba lode in Vermilion district, and have it in running order. The main shaft on the Manitoba has been relieved of accumulated water, and sinkiog was commenced again this week. A quantity of ore from the Gold Anchor lode, in Independent district, is being treated at the New York mill. The amount of smelting ore received at the several sampling works in Black Hawk during the month of July is largely in excess of that of the previous month. There is no prospective abatement in the supply for the present month. A large amount of it comes from Nevada district. The new concentration works and stamp mill of Col. P. R. Smith, in Russell gulch, are in readiness to treat ores. They will be started up as soon as water is let into the Consolidated ditch.

IDAHO.

Wood River Bullion.—*Times*, Aug. 3: The Wood River Smelting Company's furnace has been running all the week, with but slight interruption, and has produced about 25 tons of bullion, averaging 220 ozs. As the men get accustomed to the furnace, everything runs smoother, and in a week or 10 days the bullion output will probably be increased to 30 tons per week. In a few days the company will begin roasting the matte, to recover the iron, gold and silver which it contains. The smelting company has contracted for 30,000 bushels of coal more than will be required to run until Jan. 1st. If the roads are kept open it will run all winter.

A Gold-Bearing Lode.—Jas. Richardson has 3 claims which are situated about a mile and a half northeast of the Rock Creek station, on the Boise road, the ledge in which, at a depth of only 5 ft, is 3½ ft wide, and assays an average of over $200 per ton. The assays show about $10 of gold to $1 of silver—thus going to prove the existence in this section of ore carrying a high percentage of gold. The claims whence the ore came are situated about 12 miles from Hailey.

The Bullion Hoisting Works.—The hoisting works at the Bullion mine will be ready for use in about a week. The mills being unable to supply the heavy timbers required for the foundation and gallows-frame, Col. Wall had some red fir trees hewed to the required size. There being no pig-lead handy, Col. Wall used 400-oz bullion for soldering his anchor bolts.

Teams Getting Scarce.—It is evident that several thousand tons of ore will be snowed up on the dumps this fall. There is already more ore ready to ship than can be hauled by the teams, and as the season advances, the ore will accumulate until it shall become almost impossible for prospectors to get the ore to the railroad.

Kinkirkie District.—Yankee Fork *Herald*, Aug. 3: A great deal of prospecting is being done, and new discoveries are reported right along. The lucky Dan Osgood and Capt. Ring discovered an 18-inch vein of ore in their ledge on the eastern side of Washington basin, averaging from 200 to 300 ozs of silver per ton. The Germania is owned by Fred Winteshog & Co. The ore vein is solid, and contains a streak from 6 to 20 inches wide that averages from 150 to 400 ozs per ton. A force of men are at work running the tunnel on the vein, which is so flat that the ore is easily wheeled up the foot-wall. The tunnel is in 65 ft. There is from 25 to 30 tons of first-class ore on the dump ready for shipment. About 2,000 ft in a northeasterly direction is the Croesus, which shows a good vein of ore for a distance of 900 ft on the surface. At a distance of one mile in a northwesterly direction from the Bibis Back, in Washington basin, is the Washington mine, owned by Fisher, Boorn & Co. It is a mammoth ledge, showing a fine vein of quartz and rich galena. A force of men are busy developing it.

MONTANA.

Moose Creek.—Butte *Miner*, Aug. 5: Striking Moose creek—once famous for coarse gold, the Big Nugget and Nigger's claim—the old placer camp was found quiet, but not tectotally dead. Messrs. McKag & McKee have been working their Stripping claim in the gulch this season, from which they have realized handsomely. Operations in the Highland district are assuming importance. The quartz mines of the district, which have laid idle for some time, are to be opened again and vigorously worked. The Only Chance Co., of which Mr. Phil M. Saunders is the superintendent, has commenced active mining operations. The Nevius mine is being worked, the gold quartz from which is crushed in an arastra. Before fall 75 men will be at work in the Highland district.

NEW MEXICO.

Running Smoothly.—*New Mexican News*, Aug. 3: A Bonanza city man came in last evening and reported that the Duryee furnace is running smoothly. The many difficulties incident upon the starting of the machinery have, it is believed, been overcome for good, and the managers are confident that from this time they will be able to keep the thing going. The ore is running much higher than was expected, and everybody is delighted as may be presumed.

Black Range.—Prof. Mahany has gone East to submit to various mining companies full and detailed reports of the Black Range country and its mines. Prof. Mahany's last trip to the Range, which, by the way, was the occasion of one of the most thorough explorations of the country yet made by a scientific metallurgist, was made for the purpose of collecting the data to be used in the compilation of these reports. The men for whom this information is secured commend much capital.

OREGON.

Sterling.—*Democratic Times*, Aug. 5: The Sterling Co. has purchased the mining property of Kleinhammer, Reynolds & Towne, at a bargain, paying $2,500 therefor. These diggings have always been worked to a good profit, and we have no doubt but what Supt. Ennis will prove their value in quick time. The company owns the most desirable mines in Oregon, taking out immense quantities of gold dust annually.

Items.—Gin Lin is still piping with a fair head of water. Prof. Tiernan is building smelting works at Spokane falls. The Applegate gravel diggings are being worked again by Dan Silva. Orme & Co. are commencing preparations for the prospecting of their quartz ledge on Foots creek. Lence & Co., of Foots creek, are engaged in making extensive preparations for winter. They will in all probability cast aside their little pipe and use a "Giant" hereafter. W. Prefontaiu, of Foots creek, informs us that about all the miners in that section have cleaned up, but the results have not generally been as favorable this year as last. Wimer & Simmons, of Waldo, continue cleaning up. They expect to do better than ever this season, and some who pretend to know estimate that they will take out over $20,000. Jesse Adams took out $3.50 in gold in one day's prospecting on Talbott's place on Wagner creek, and a $5 piece of gold quartz was found on the ground a short time before. Newell De Lamater, of Kerbyville, was in town this week. He informs us that about 25 men are engaged in digging the ditch leading to mines on Cow Flat he is interested in, who will soon complete their contracts. Everything will be in shipshape when water comes, and extensive operations are prospective

UTAH.

North Horn Silver.—Southern Utah *Times*, Aug. 6: Work on this property is steadily progressing night and day. The deep tunnel on the extreme north end is in about 60 ft, with a good showing of ore. The face of the tunnel is only just getting into the mineral-bearing rock, and, as its course is diagonally across the ledge toward the hanging wall, the presumption is that in running to it a body of ore will be cut. About midway on this property is located the Republic mine, on which a shaft is down 60 ft in heavy black iron, deeply stained with copper. This shaft is being sunk near the hanging wall of this vein, a distance of 140 ft from the foot wall. Along the latter wall, at intervals in the out-croppings, there are seams and spots of lead ore that contain from 25 to 50 ounces silver per ton. This ore has a gangue of carbonate of iron—a natural flux.

Our Mining Interest.—This week has brought us some few changes in our mining interest. Mr. Cullen came here for the purpose of commencing work upon the Lulu, and a force of men was started early this week. The owners of this property are all wealthy, and are confident of unveiling a bonanza equal to the Horn Silver. The Grampian mine, situated westerly from the two properties named, has also new life thrown into it by Mr. Donaldson, of Denver, Col. Matters are now adjusted and everyone paid in full, and work has been resumed on the property. With the exception of about one claim, lying between the Horn Silver and the North Horn, we have mining operations in full blast, and with extraordinary prospects along this great vein for a distance of nearly 2 miles, we regard the prospects of our camp as more bright than at any time during the past year. Capital is being invested and work carried on with a will.

The outlook of Plumas, says the *National*, is 50% better at the present time than ever before. The mines never looked half as well, and new ones are being discovered every day.

The High Sierra and its Royal Robe.

[Read before the assembly of the C. L. S. C., at Monterey, July 7, 1881, by J. G. LEMMON, and furnished for publication to the PRESS.

The Sierra Nevada is a rich, lordly, be-jeweled prince among our mountain ranges. Other chains of mountains ribbing the earth are usually high-raised elevations, composed principally of large, rounded mountains swelling their bosoms toward the sky and trailing their thin, tattered garments far out over extensive, abutting foothills to the flanking plains.

The long Rocky Mountain range, the backbone of North America, is of this class. It rises so gently from the plains on each side, that the traveler by the Union Pacific can scarcely discover that he is on a mighty swell of the earth's crust, or detect the exact spot where he passee the broad saddle of the highest point.

But our Sierra Nevada is not so. He is distinguished alike by the geographer or the traveler, for the steepness of his majestic uprise from the plain, the rough-hewn and splintered form of his thousand peaks, the high elevation of their pinnaclee ever bearing their crowns of snow; but most of all, he is pre-eminent for his bounteous and beauteous enrobing forest, his royal, parti-colored garment.

Like an Oriental monarch, he reclines in state upon the bosom of the great treeless plain of Western America, enwrapped from head to foot—600 miles—and from eide to side—140 miles—with a dense forest of evergreens, interspersed with many-colored, deciduous-leaved trees, like insertions of brilliant figuree in a royal emerald robe.

This enrobing forest—tbe noblest in North America—ie perforated along its raised center line, or axis of the Sierra, by a thousand peaks rising tbrough the mantle into the region of perpetual winter, while both slopee are rent by a million valleys depressed through the robe into the middle region of changing seasons. Often these valleys are still filled with water from the melting snows above, forming lakes of matchless purity and beauty.

The snow-crowned pcaks are the sparkling diamonds of this wealthy prince, the valleys and lakes are his resplendent emeralds and pearls. The former flash upon the voyager floating on the far westcrn Pacific or the toiler over the wide eastern desert; but the royal robe, with its decoratione of valley and glen, its geme of tree and shrub, flower and fern, reveal themselves to the miner in the canyons, the farmer herding his flocke in the grassy valleys, or the hunter pursuing his game through the forest.

But, of course, these peculiarities are observed most of all by the lover oi nature, who explores the Sierra with heart attuned aright and perceptions opened by interior appreciations, for it is an old saying:

"'Tis the world within creates the world without."

Such a visitor's first emotions are a mingling of astonishment, awo and delight. If he has explored tropical countries, he will he disappointed by the fewness of species, perhaps, but surprised by the great multitude of individual trees and their large size. If he is familiar with Arctic scenes, he will miss the dwarfed trees and monotonous sameness so foreign to the Sierra.

Vegetation in the Zones.

Two other comparisons are pertinent here, also. In tropical countries, life presses in and holds the ground against fierce-opposing contestants. This is especially observable in the vegetable world. A small epring issuing from a mountain side in Arizona or Mexico will be attacked at its very source, and its watere abeorbed by the eager rootlets of a hundred speciee of plants, a broad-headed hackberry or a tall cottonwood crowning the mace of foliage and striking its roote deepeet under the rock floor of the spring. Streame large enough to feed all the thirsty gourmands by the way, and yet escape to the plains, are marked all through their winding couree by a hroad border of vegetation.

Shade and northern inclination aleo foeter vegetation for obvious reaeone; hence the north slopes of most of the peake, and eepecially of the eteep ranges of Arizona, have a vestiture of foreet, though it is mainly thin and low.

In Arctic climee, the cold, long wintere forbid all but a few eepecially hardy plants from gaining a foothold. Thc entire face of the country heing moist, the plants are not alone found along etreame, but equally diepereed, varying only by conditione of elevation or inclination. The water couree are hordered with meadowe composed ueually of hut one or two speciee of grase or eedge.

So, also, large foreste will be found containing but one or two kinde of treee, and these are emall, dwarfed and snow-hent, at length reduced to prostrate creeping huehee on the ehores of the Arctic eea.

But the Sierra of California occupies a middle position between torrid and frigid regions, a position moet favorable to the producing of large foreste containing many epecies of noble trees and rich valleys of divereified flowere.

Trees of the Sierra.

The enrobing foreet is compoeed mainly of evergreene, not one epeciee of which is identical with any at the East—if we except a little, dwarfed variety of juniper, that barely reaches the Sierra from the east. It ehares, however, eeveral epeciee with the Rocky mountains at the east and the Coaet range on the west.

Chiefeet among theee evergreene ie the chief of all treee—the "great *Sequoia*." So much hae heen written and sung about tbis tree, detailing its immense proportions and eetting forth its history and destiny—I, myself, contributing to the local papers several articlee in times past—that I will not add worde here to this truly marvelous tree, the worthy king of the vegetable world.

Next to the "Big Trees" in size, but far excelling that species in loveliness, are the four species of fir trees inhabiting the high Sierra. These species arrange themselves in pairs as "red-harked" firs and "white-harked" firs; but they train together oddly; that is, each red fir has a white brother in attendance, like Don Quixote with Squire Sancho Panza. One of theso ill-assorted pairs, viz., *Abies magnifica* and *A. concolor*, inhabit the eouthern portion of the Sierra, while the other pair, *Abies nobilis* and *A. grandis*, are met with in the northern regions.

The Fir Family.

The fir family is at once distinguisbed by the eymmetrical shape of the tree, which is conical or fusiform; the limhs radiate horizontally in whorls of three to nine; the branches and twigs, also the leaves on lower limhs, are all disposed in the same way; hence, they resemble large fans, and touching each other at the sides, they form strata of airy basket work, that sit within one another in a diminishing seriee from bottom to top.

The cones of fir trees are borne on the long, uppermost limhs, and stand upright on the terminal, robust twigs. They are composed of numerous close-set scales, wbich fall away at maturity, together with the large, winged seeds, and leave the rachis or naked core of the cone remaining on the tree. Hence you never find fir cones lying ahout under treee as you do of the spruce, pine and cypress.

Chief of the fir trees, both in size and beauty, is the "red-barked fir," a name by which hoth the southern form and the northern is called—and very properly, too, for the hark of both ie a deep madder red when exposed; and they resemble each other in all essential detaile except one. The northern red fir, *nobilis*, has long, exserted bracts protruding from the cones and depending along the sides. The eouthorn red fir, *magnifica*, is generally devoid of these exserted hracts.

This species has been all along mistaken for the *Abies amabilis* of Donglas, and California botanists will probably continue to call it by that lovely name, notwithstanding Dr. Engelmann's recent clearing np of the whole matter, and conferring of the equally appropriate name of *magnifica*.

Travelers aver that no tree known exceeds these species of fir in their grand, symmetrical uprise and tho delicate tracery and airy beauty of their foliage. One has hut to visit a grove of these etately treee—notably around the bsse of Shasta—to receive impressions of grace, beauty, loveliness, majesty and perfection, that will serve for mental enjoyment while memory endures or the soul can comprehend.

Trees of these two red firs—*nobilis* and *magnifica* (or *amabilis*)—form dense groves on high plateaus, 6,000 to 10,000 ft. altitnde. Their color is a dark olive green, and their favorite position is usually just above the thinner forest of pines, with their lighter shades, while just above the fire ie usually found a fringe of the noxt family to be considered.

The Silver Spruce.

Tsuga Pattoniana, extending its beautiful, pyramidal figure, and green and silver foliage far up the canyons, hecoming dwarfed, at last, to bent, prostrate, snow-laden bushee at the foot of the glaciers or snow-clad pinnacles.

One can hardly, without inspection, imagine the heautiful effect prodnced mainly by the differences of tinte displaved by these treee, which are otherwise widely different in aspect. The "eilver epruce" treee, a trne alpine inhabitant of the Sierra, is often, in sheltered localitiee, very large, and with its eoon tapering trnnk and outline, they form an exceedingly graceful tree. The longeet limbe are helow, hecoming diminished until the top ende in a epire. The limbs all start downward from the trunk, then curve outward, lastly upward, hearing the small, purple conee in clueters from the ends of the terminal branches, like wide-epreading fingere.

Aesociated with the silver epruce is often found a variety of the Eaetern juniper epoken of, a low, creeping, prickly-leaved shrnb, covering rocke and knolle, remarkable principally for heing the only conifer tree from the East which reachee California, and it ie eingular, and perhaps fitting, that he ehould *crawl* thus into our Sierra flora.

Aleo, a variety of pine usually keepe close company with these last mentioned alpine treee, hut, like them, muet be dwarfed to low, thick-browed ehruhe, hearing its emall, glohular conee on ite ehort, etout, white limhe. This pine ie the variety *albicaulis*, of the epecies *Pinus flexilis*.

The Pines.

The last paragraph leade ue to the diecussion of the treee which compose the great mase of the Sierra forest, the beneficent pine, the moet ahundant, the easieet manufactured, the tree best adapted to various usee of all the treee on earth. They compoee eight-tenthe of all the treee that clothe the earth, and contribute three-fourths of the material for our housee, mills, bridges, roade, wharves, veesels, etc.

They are principally found in the northern temperate zone, and tho largeet continuoue forest of them ie in the Southern Statee, eoutheaet of the Alleghaniee, and extending from Miseiesippi to North Carolina. But the noblest, largeet, most valuable trees on earth form the chief warp and woof of the royal robe of Prince Sierra.

We cannot, in this paper, enter into statietics of the immense lumher business prosecuted in the Sierra—notably at Truckee—from which so large a part of California and Nevada, as also the greater part of the basin eastward and the desert southward are supplied. Two months ago, we rode into the town of Franklin, opposite the old town of El Paso, on the Rio Grande, with the firet conetruction train that entered the city. Several of the cars were loaded with lumber, compactly piled and bearing a placard marked, "From the Truckee Lumber Co." Two weeks ago, we visited Salt Lake City, and there in the depot of that thriving town workmen were nnloading care laden with lumber hearing the same legend. And last week, I saw, in contracts for huilding mills in Sonora, it ie stipulated by the Mexicans that the timber shall be of Truckee lumber.

The pine family proper ie a large one, comprising, in all the globe, about 68 species. There are, in California, 20 epecies, 9 of which are fonnd in the Sierra. A pine may readily be recognized hy its leaves being acerose or pointed, and persistent; and they are alwaye in hundlee or fascicles, which are sheathed at base, each fascicle containing from one to five lcaves each, alwaye alike in the same species. The difference in the number of leavee in a fasciole eervee tc divide the family into four groups.

The Sierra contains one epecies with single leaves—*Pinus monophylla*—the "nut pine" of the Nevada slope; one epecies with leaves in pairs—*P. contorta*—the so-called "California tamarack;" three epeciee with leaves in threes—*P. ponderosa*, the "yellow pine;" *P. sapiana*, the "foothill" or "gray-leaved pine;" and the *P. tuberculata*, or little "ecrnb pine." Lastly, there are four epecies in the Sierra which have their leaves in fives, and they are also very short. These are *Pinus Lambertiana*, the famone "sugar pine;" *P. monticola*, the "mountain" or "white pine;" *P. Balfouriana*, "Balfour's pine;" and a variety of *P. flexilis*, the "dwarf alpine pine."

Largest of these species is the splendid eugar pine, a noble tree, specimens of whicb are found often 12 to 14 ft. in diameter and over 200 ft. high. It is a peculiarity of this tree snd of the nearly related "mountain pine," that the largest limhs are at the top, from the ends of which the large cones depend, like Chinese lanterns.

The most ahundant pine is tbe yellow or pitch pine, a polymorphous species, which is distrihuted well over the mountains of all the coast and eastward as far as the Rocky mountains. So diverse and apparently distinct are its varieties that half a dozen names are given it by lumhermen, and also soientiste have made threo species out of it. A great deal of examination has been given to the forms of this species lately, and the variety, *Jeffreyi*, found on the high slopes, especially of the eastern eide of the Sierra, has lately heen declared by Dr. Engelmann to he distinct.

Tbis tree normally has but three leaves in a fascicle, hut in '75 I found a tree in the Sierra that hore ite leaves in fascicles of fives, aod it was sent to the Centennial. And thie leads to an important etatement I am about to make.

The Alleged New Pine.

The so-called new species, *Pinus Arizonica*, of Engelmann, we helieve is but a sport of *P. ponderosa*, or "yellow pine." The species is founded on specimens collected and observatione made hy Dr. Rothrock, in 1874. He found growing on the Santa Rita mountaine of Arizona a tree called by the lumber dealers "yellow pine," and which resembled etrongly in its cone, *P. ponderosa*, but which had its leaves in fascicles of fives. Other slight differences were noted also by Dr. Engelmann, to whom the epecimene were enhmitted, and he writes: "This eeeme to be a meager acconnt to fonnd a epeciee npon in a genne so difficult ae *Pinus*, but I find it impossihle to nnite it with either of the allied epecies."

Last Septemher, while the Census Commiseion of Foreetry, including Dr. Engelmann and Prof. Sargent, vieited thie coaet, they went down to Arizona and paid a visit to the Santa Rita mountains. From ahundant epecimens and examination at leisure, they come to conclueione confirming the new species.

Now, we have jnst returned from a botanical tonr through Arizona and New Mexico, and fortunately we were enabled to explore quite thoroughly a neighboring range to the Santa Ritae; that is, the Santa Catalina mountains, about 50 miles north of the former range. Botanically epeaking, the Catalinas are moet interestiog, for their eteep, eplintered peaks, arranged in two eeriee, which inclnde a large park of denee forest hetween them, afforde, perhape, more speciee and varietiee of flora than any region of the south. Here, in thie beautiful, high deer park, we found, secluded from the scorching deeert winde, a dozen epeciee of rohnet treee, including the *Pinus ponderosa* in every variety of growth and appearance. Some treee hore only their leavee in threes; some in fivoe, and eome bore fasciclee varying from two to eeven. The conee also preeented a wide diversity.

To be eure, this forest is not the one in which the original *Arizonica* was found, bnt five-leaved epecimens which I lately sent to Dr. Eogelmann, he reports ae certainly the new epeciee, and I am juet ae *sure* that conneoting forme unite it with unmistakable *ponderosa*.

The Doctor separates the species by very abstruse distinctions based upon a careful microecopical examination of the leavee. Thne: "*Ponderosa* (with other epscies), leavee in threes, sometimes in fours and fives; their sheaths persistent; strengthening cells under the epidermis around tbe resin ducts. *Arizonica* (with other epecies), leaves in fivee. Ducts usually free of strengthening cells."

Of course, auy character, if it is even *microscopic*, which is *permanent*, is therefore *distinctive;* but it will be seen that in *Arizonica* the ducte are only "*usually*" free from strengthening cells. To most botanists, other charactere hased upon differences of frnit, growth, timber, as well as appearance, would be necessary for eetablishing a eeparable form—a distinct species.

The Sierra Pines Again.

Returning from this diecussion, let us look again at the pines of tbe high Sierra in detail, ae they engage the eye of the lover of natnre. Some of the most beautiful effecte are prodnced at eeveral placss in the high Sierra hy helts of trees of different shadee succeeding each other like circular capes, on the slope of high peaks, like the Lyell group, near Yosemite; Mt. Tellac, near Lake Tahoe; Lassen's peak and the peerless Mt. Shasta, at the head of tbe Sierra. When, added to these in tbe autumn season, groves of deciduous trees, as oak, maple, poplar and willow, line the canyons which cut acrose these belts vertically, and thus, by their rainhow tints, deck the circular capes with dashes of yellow, crimson and hrown, the effect is exquisite beyond description.

For keen perception of distinctive characters and artistic descriptions, with a certain lovely, nnique mode of expression, no one exceeds John Ruskin. Happily, he has turned his attention toward the very ohjects mostly treated of in this essay—the pines. Hence, I cannot hetter close than hy quoting a few of his paragraphs, in which I have taken the liherty of changing a few sentences.

It sbould be understood tbat until lately all the cone-bearing trees, including the fire and epruces, were called pines, and some of the trees treated of by Ruskin were no douht epruce.

"The pine, placed nearly always among scenes disordered and desolate, hrings into them all possihle elements of order and precision. Low-land trees (as oak, ash, poplar, and the like) lean to this eide and that, thongh it is but a meadow breeze that bends them, or a bank of cowslips from which their trunke lean aslope. But let storm and avalanche do their worst, and let the pine only find a bit of vertical ledge of rock, or even a cleft in the face of an almost perpendicular rock, it will nevertheless grow straight toward the zenith. Suspend a plumhline along its trunk, the plummet ehall point to the center of the earth as long ae the tree lives.

I wish the reader to fix his attention for a moment on tbese two great characters of the pine—its straightnese and its rounded perfectness—both wonderful and in their issue lovely, though they have hitherto prevented the tree from heing drawn. I say, first, its straightness; hecanse we constantly see it in the wildest scenery, and we are apt to remember only as characteristic, examplee of it those which have heen disturbed hy violent action or disease. Of course euch accidents are frequent. The soil of tbe mountain is subject to continual change; perhaps the rock in which the tree is rooted splits in frost and falls forward, throwing the young stems aslope. But eventually the pine riees heavenward in serene resistance, self-contained and triumphant."

With regard to its other chief character, the perfection of its rounded spire, Ruskin says: "The impression on most people's minds must have been received more from pictures than from real inspection of the tree—so ragged and nnsightly they think the pine; whereas, ite chief character in health is rich greenish and full roundness. It stands compact like ooe of its conee, slightly cnrved on its eides, finished and qnaint like a ehorn tree in a nohleman'e park, and instead of being wild in expression, forme the eofteet of all foreet ecenery, for other treee ehow their twieting etems and boughs; but the pine, growing either in luxuriant mace or in happy isolation, allowe no wood to he eeen. Summit hehiud eummit riee ite pyramidal ranges, or down to the very graee eweep its circlet of boughe. So there is nothing hut green cone and green grass. Nor," he adde, "ie the pioe eofter, but in one eense more cheerful than other foliage. The treee of lowlsnd forests, as the oak, ash, maple, etc., interlace their branchee overhead and checker the earth with darknese, hnt the pine, growing in scattered groupe, leaves the gladee hetween emerald hright. Ite gloom ie all ite own; narrowing into the eky it lets the sunehine etrike down to the dew hetween ite long-pointed ehadowe."

A WELL-DRILLED MAN.—Patrick Mulligan, who has heen in the hospital for ahout three weeks, wae yeeterday eufficiently recovered from hie injuries to appear on the etreet, and ie confident that within a few daye he will he ahle to reeume work in the mine. No other man in Montana can eay that an eight-ponnd two-ft. inch drill ever passed through his hody. Not one man in a million could experience the sensation and live to tell ahout it. Mr. Mulligan eete a great value upon the drill, and proposee to keep it ae a memento. Soon after the accident occurred, and when he first knew there wae a poeihility of eaving hie life, he expreseed the eomewhat eupereti tioue helief that if the drill were polished and preserved he would ultimately recover. To gratify the hnmor, the hoye at the mine have every day devoted a little time to the polishing of the drill, and it ie now as bright and glistering ae a new eilver dollar, and Mulligan is well.—*Butte* (Montana) *Inter-Mountain*.

Gold Park Mines.

A New Mineral Belt.

Every day new districts are being found in Nevada. One of the latest and, probably, the richest of these latter is Gold Park in Nye county, Nevada. A correspondent of the *Bonanza* says, I journeyed for miles from Grantsville along the foothills, passing the dormant town of Ione and sagebrush. After six hours of easy riding I reached the mouth of Gold Park canyon, which is somewhat narrow, with steep mountains on either side heavily timbered with gigantic pines. Following the road through willows, poplars and currant bushes I finally came to a wide and beautiful basin, fresh and green, the whole reminding one of the beautiful scenery of California. My interest was strongly attracted to a lovely spot resembling a park from which it derives its name. My energetic and enterprising friend, Mr. San Pedro, has recently erected a boarding-house close by a couple of springs of the coldest and purest water.

The Mineral Belt

In this district is about seven miles long and three in width, running north and south, and contains porphyry, syonite, some lime and quartzite; but porphyry and syenite predominate, the former showing always on the foot-walls of the mines. The ledges run parallel in groups, generally three in each, from 25 to 50 ft. apart, running northeast and southwest, varying in width from one and a half to eight ft., inclining to the east at an angle of from 40° to 50°. The ore is of a decomposed quartz character, very soft and carrying some lead in a carbonated condition; also some copper and iron and gold and silver. By carefnl averages taken from these mines it is safe to say that the ores in this district will mill $60 per ton without asserting; $45 in gold and $15 to $20 in silver. The ores are free milling and the small percentage of lead being of the oxide of carbonate order will not do any harm to the process of wet crushing and pan amalgamation. The gold is so free that a small lot of this ore worked in San Francisco on plates gave a good result, but pans will be the best. By the latter process ore worked in Grantsville in small lots gave a result of $4.50 tailings, when the pulp assay was $185 in gold and $15 in silver.

The Gold Park Mining Company

Is running two tunnels. The first I visited is the one running for the Arctic group of ledges. This tunnel is being run from the east side of the hill and is now in 191 ft. It has passed through two of the ledges. The first is from two to two and a half ft. in width and averages about $70 per ton, almost all gold only $10 being silver. The second is smaller and carries less pay. They are now about to strike the Arctic. This ledge has an incline 60 ft. in depth and the ledge is four ft. wide. This is the west ledge, and when tapped will be (owing to the steepness of the hill) 175 ft. from the level of the tonnel to the croppings, and I must mention here that the pay ore goes to the surface. The next tunnel is on the

Star of the West

Series, also started from the east side of the hill and is now in 113 ft. having passed through two ledges. The first is about two ft. wide, of decomposed quartz, giving an average of $85 in gold and $12 in silver; there is little or no lead or base of any kind in this ledge. The next one is smaller and as in the other tunnels not quite so rich as the first.

The Star of the West No. 1,

Which lies farther west, has an incline of 50 ft. and averages three ft. from top to bottom. This is the richest of all, averaging $120 in gold and $15 in silver. Directly opposite this mine, on the west side, is the San Francisco group or series, running and pitching the same as the series on the east side.

The San Francisco

Has a 75-ft. incline and in the bottom an eight-ft. ledge of free milling ore, but of a low grade, averaging about $20 in gold and silver.

The Sacramento

A little farther to the north shows large croppings with bunches of rich gold and silver ore; but little work has been done in this mine to determine its real value. My opinion is that this is the same mine they have in the bottom of the San Francisco incline.

The California

Is another of these series or groups, but no work has been done on it. The Gold Park mining company is the owner of several more ledges on this hill but no work has been done on them as yet. The intention in future is to keep ahead with the Star of the West tunnel, and by running 700 ft. will tap the San Francisco series at a depth of 600 ft. They have secured all the best mines with three United States patents, also own the town site and water right. Wood, of which there is an abundance, will, when they are ready to start a mill, not cost over $2 a cord delivered. With these facilities the ores can be worked in this district by wet crushing at a cost not to exceed $5 a ton.

There are several other good prospects in this district farther to the south on the same belt, but as I have not seen them I can say nothing in regard to them.

I left with the favorable impression that the mining district will undoubtedly prove to be one of the most prominent gold and silver producers in Nevada.

Useful Information.

Queer Bread Materials.

Earth bread is made from a white earth in Upper Lusatia, formerly a part of Germany, but now under the rule of Prussia, and the poor of that region use this bread in times of scarcity. The earth is dug from a hill where saltpeter was once manufactured. When laid in the sun until heated, it cracks, and globules like meal exude from it. These are mixed with a little flour and soon ferment, and is then baked. It is supposed that the saltpeter or soda in this earth gives its lightness.

Something similar to it is found in Catalonia, and is also used for bread. It is affirmed that in cases of extreme need, many have lived on this bread for weeks without experiencing any injury. Soft stones were ground and made into bread in the late famine in India, to prolong, if possible, the lives of that stricken people. Fish bread is still used in Iceland, Lapland, Crim-Tartary and other places far north. The fish is first dried, then beaten to a fine powder; and sometimes the inner bark of some of the trees of that region is mixed with it, and then wet and made into bread and cakes. Moss bread is manufactured in Iceland, from the reindeer moss or *lichen rangiferinus*, which, toward the month of September, becomes soft, tender and damp, with a taste like wheat bran. This moss contains a large quantity of starch, and the Icelanders gather it in the latter part of the summer season, thoroughly dry it, then grind into meal; and bread, gruels and pottages are made with it. The want of better grain frequently compels the poor Icelanders to bake a kind of bread from the seeds of the sand-reed; *elymus arenarius*, which on their shores are merely eaten by the birds of passage.

Cheap Tinware.—Now, a word or two about cheap tinware. You needn't expect to get a dish-pan for 20 cents that's worth 60; they don't grow, and if they ever did, the tree is dead and the seed lost. When you buy a pan for 20 cents, depend upon it, it's only worth 20 cents. The iron of which it is made is of an inferior quality, brittle and rotten; it won't stand bending; the tin with which it is covered is nearly all lead, and there's very little of it, anyway; and it will wear off, and the iron rust through in a few weeks, while a 60-cent pan, made of good charcoal iron, and covered with pure tin, and plenty of it, will last you for years. Dealers keeping this cheap trash should always have the good also, and explain the difference to every customer. You'll lose a sale occasionally, because some unscrupulous fellow will swear by everything that's lovely that his "dwenty-cent pan is shoost the best vot ever vas," but you'll gain in the long run; you'll sell more good ware than had, and you will have a name that is better than great riches.—*The Enterprise.*

A New Product from Birch Bark.—A French inventor has recently patented a method of improving India rubber and gutta-percha by the addition of a distillate of birch bark. By distilling the outer layers of the bark he obtains a dense, black, gummy matter which possesses the properties of ordinary gutta-percha with the additional quality of resisting both the action of air and the strongest corrosive acids. He claims also that by adding a small proportion of the birch bark gum to gutta-percha or to India rubber (one-twentieth part will suffice), the durability of the rubber or the gutta-percha will be greatly increased, the new mixture not being acted upon by the air or by acids.

Sharpening old Files.—The edge produced on files by acid does not hold; a recut file differs from a new one in temper, as drawing and replacing the temper injures the steel, the original temper seldom being attained. The only method of sharpening a file and making it as good as new, is by the application of the sand blast. I have been using this in my shop about six months, and can sharpen an old file equal to new (without disturbing the temper) in from one to three minutes. I prefer old files thus treated to any new files, as it makes them keener and smoother cutting, and prevents breakage of teeth.—*Blacksmith and Wheelwright.*

Holes may be bored in porcelain by means of an ordinary machine drill. The drill is kept moist with oil of turpentine, and caused to revolve rapidly by taking one twist of the string of a bow about, and drawing the bow quickly backward and forward, after the manner of using a saw, while the head of the drill is held in position by a loose oiled brace.

Perfumed Camellias.—A gardener at Naples holds out the hope that in the near future the camellia will rival the rose in fragrance as well as in beauty. After years of experience he has succeeded in producing a camellia with a delicate perfume. It is of a pale rose color, and the gardener hopes to obtain before long fragrant white blossoms.

To remove putty from broken windows dip a small brush in nitro-muriatic acid or caustic soda (concentrated lye), and with it anoint or paint over the dry putty that adheres to the broken glass and frames of your windows; after an hour's interval the putty will have become so soft as to be easily removable.

The Grease Tree of China.—Mention has been made in these columns of the value of the grease tree of China as a lubricant. It is said that large forests of this vegetable lubricant are to be found there, and they form the source of a considerable local traffic. This tree not very long ago was imported into India, and it is said that the experiment of cultivating it there has proved quite successful. In the Punjaub and northwestern provinces generally, it grows as rapidly and vigorously as in the native soil, and there are already thousands of trees on the government plantations yielding tons of seeds, admirably adapted to a variety of commercial purposes. Dr. Jameson, a chemist in the Punjaub, has prepared a quantity of grease from this tree, and has forwarded on trial a portion of it to the Punjaub railway to have its qualities tested in a practical manner as lubricating matter for those parts of the machinery constantly exposed to friction. The grease thus obtained forms an excellent tallow, burning with a clear, brilliant and, what is infinitely more to the purpose, a white light, and at the same time emitting not a trace of any unpleasant odor or of the ordinary disagreeable accompaniments of combustion.

To Make a Clear Caoutchouc Solution.—Perhaps the following recipe will be of service to some of our readers: Prepare a capacious linen bag, in which place about an ounce of finely chipped caoutchouc. Suspend this by a thread in a flask containing about a quart of benzine, in such a manner that the linen bag is held near the surface of the liquid. The soluble portion of the gum—about 40% to 60%—will be dissolved out in the course of about a week, and will pass into the benzine, forming a clear, limpid, but viscous liquid, containing about 1¼% of caoutchouc. The linen bag with its contents, now enormously swollen, should then be withdrawn and the clear liquid poured off into a suitable bottle tightly stoppered, and kept in the dark, as it shows a tendency to decompose on exposure to the light. The swelled contents of the bag containing the residue of the gum may be utilized for the preparation of an inferior grade of caoutchouc cement or varnish, by the addition of more benzine.

Good Health.

Unfavorable Effects of Irrigation.

The city of Ismailia was built up upon the banks of the Suez canal immediately after the construction of that work. It was supposed that the new city would immediately come into notice as a place of health resort. No one ever expected that a newly founded city, in what was little more than the open desert, with a fine fresh breeze blowing over it daily, would be otherwise than a sanitarium, but it was soon found to be quite the reverse. Many have tried to find out the reason why Ismailia should be so unhealthy, but the reason generally given is this, that the new city having now a fresh-water canal from the Nile running close by, the sandy soil has got thoroughly saturated with water by filtration, and also from irrigation of gardens at Ismailia (not to speak of decayed vegetable matter lying about here and there), so that the evaporation through the soil is immense, and such an unhealthy atmosphere breathed night and day by the inhabitants, who generally live in houses of only one story, and remember, in almost a tropical climate; all this combined seems to have produced the serious Dengue fever, which has of late raged there and compelled the Court, with many of the former residents, to remove to Mansoura, on the bank of the eastern branch of the Nile. Of course, M. Lesseps is much grieved at such an exodus from his pet city of Ismailia; and the Suez canal employees there, who form the bulk of the inhabitants, have lined the fresh-water canal with cement, to keep the water from saturating the soil as formerly; and the cultivation of cabbages and other vegetables which were grown so freely under a copious artificial irrigation has been discontinued.

Dangers of Anæsthesis.—The Cincinnati *Lancet* considers that the condition of artificial anæsthesis, no matter by what agent produced, is always a condition of danger. The term is somewhat vague, too much so indeed for strict reasoning. We may say that travel on a railroad always constitutes a condition of danger. We agree with the *Lancet*, however, in the general expression. The truth is that anæsthesis is really partial death. It is a suspension of one of the most important functions of life. Although we have witnessed the condition with countless frequency during all the long years since the introduction of ether, yet we must confess that every instance of anæsthesis still brings to mind the idea of death, and produces the impression that the patient is pushed so near to the grave as to suggest the possibility that he will not return.

Hot Water in Anæsthesis.—In a letter to the *Lancet*, Dr. A. Paggi records the following observation: He states that in Paris he saw a case in which, under the inhalation of chloroform, the heart ceased to beat, and artificial respiration for ten minutes to restore circulation, when Dr. Labbe dipped a large cloth in boiling hot water and applied it to the region of the heart, with the result of immediately restoring the action of the heart.

Mortality of Brakemen.—The brakemen on our railroads find it quite difficult to get their lives insured. It is estimated that there are at least ten brakemen killed throughout the country every day while coupling cars and making up trains, or are knocked from the top of the cars by bridges, or slip or fall, or are injured or killed in collisions. Then there must be at least three times as many injured as are killed, of whom the public get no account. If 10 brakemen are killed every day, that would be equivalent to 3,650 during the year, which, added to the number injured in various ways while on duty, would give the sum total of deaths and injuries about 14,600 a year. These are frightful figures of a fatality, a loss of life, or injury to the body. The public has no idea of the number of accidents that occur on the various railroads throughout the country every day. There is no vocation so fraught with danger to life and limb as that of the brakemen on our railroads, particularly on freight trains. Indeed the life of a brakeman is a precarious one. Some insurance agents in some parts of the country do not take risks on employees on freight trains; but conductors and brakemen on passenger trains, where there is less danger, are insured by their paying an extra per cent. Railroad men say that only about 25% of the brakemen of freight trains die a natural death, also, that the average life of the brakeman, after he goes on the road is about 10 years.

The Meaning of Dreams.—Lively dreams are, in general, a sign of excitement of nervous action; soft dreams, a sign of slight irritation of the brain, often, in nervous fevers, announcing the approach of a favorable crisis. Frightful dreams are a sign of determination of blood to the head. Dreams about fire are, in women, signs of impending hemorrhage. Dreams about blood and red objects are signs of inflammatory conditions. Dreams about rain and water are often signs of diseased mucous membrane and dropsy. Dreams in which the patient sees any part of the body especially suffering, indicate disease in that part. Dreams about death often precede apoplexy, which is connected with determination of blood to the head. The nightmare, with great sensitiveness, is a sign of determination of blood to the chest. "To these," says Baron Von Fechterlehen, "we may add that dreams of dogs, after the bite of a mad dog, often precede the appearance of hydrophobia, but may he only the consequence of an excited imagination." Dr. Forbes Winslow quotes several cases in which dreams are said to have been prognostic: Arnaud de Villeneuve dreamed one night a black cat hit him on the arm. The next day an anthrax appeared on the part bitten. A patient of Galen dreamed that one of his limbs was changed to stone. Some days after his leg was paralyzed. Hippocrates remarks that dreams in which one sees black specters are a bad omen.—*Dr. Hammond in Druggists' Circular.*

A singular surgical operation was recently performed upon a well-known St. Louis real estate agent, in which a pound of adipose tissue was taken from the back of his neck. The patient is a very large man, whose weight is 249 lbs. The fat had begun to gather in such heavy folds about the neck as to become a source of constant annoyance, the head having been crowded forward and held in an unbecoming position. The skin was divided at right angles, so that the wound made a sort of cross, from beneath which all the underlying fat was taken. The piece of flesh is said to have weighed exactly one lb. The patient took nothing to sustain him in the trial, and did not appear to suffer much, even when the parts were being cauterized, to prevent a formation of new tissue. The wound being closed up and bandaged, he lighted a cigar, ordered the pound of flesh to be thrown into the sewer, and sat quietly down to read the paper. Only a few drops of blood were lost, and no serious consequences are expected. The patient was not prevented from taking his usual morning walk, and expected to be able to attend to his usual business within a week from the time of the operation.

Fear of Disease.—It is said that while the plague was raging in Buenos Ayres, the gravediggers bore charmed lives. Of the 300 men so employed not one died of the disease. It has often been noticed that during the prevalence of pestilential diseases, physicians, undertakers, nurses and grave-diggers, whose business compelled constant liability to infection, have usually escaped in a far greater ratio than their numbers would warrant. The "charm" of this immunity from the prevailing scourge is very simple. They are not *scared*. They are *positive* to the disease, and repel its attacks. *Fear* is a great ally of death. Whoever is afraid of disease is in a *negative* condition and really invites its approach. And thus it is the world over. The brave die but once, while cowards die many times. Much unnecessary alarm exists in every community in regard to many diseases. We are, it is true, all liable to sickness and death. But if we are all sober, cleanly and brave of heart, we need have no fear of disease of body or mind.—*Golden Rule.*

In cases of sprains, says a medical writer elevate the limb, keep the joint perfectly quiet, apply luke-warm lotions or fomentations. When inflammation has ceased, apply stimulating liniments and bandages; shower the parts with cold and warm water alternately.

MINING AND SCIENTIFIC PRESS

TABLE OF CONTENTS.

EDITORIALS.—A New Form of Girder, 97-105. Passing Events; Boiler Explosion Test; The Gold Bluffs and Gold Beaches on Our Northern Coast, 104. Contribution to the Geology of California; Patents and Inventions; Notices of Recent Patents, 105.

ILLUSTRATIONS.—Details of New Form of Iron Girder, 97.

CORRESPONDENCE.—The Hydraulic Mining Question; Inter-Mercurial Planets.—No. 3, 98.

MECHANICAL PROGRESS.—New Applications of Electricity; Electric Transmission of Power; Sun Power; Friction; Salt as a Lubricator; Nickel Plating by Boiling; Large Steam Engines, 99.

SCIENTIFIC PROGRESS.—A Phosphorus Microphone; Discovery of Another Comet; "The Cry of Tin;" Curious Phenomena of Flames; No Life in Meteorites; Substitute for Plaster of Paris; Effects of Optical Slits; Water in an Amethyst, 99.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Dividends, 100.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, Oregon and New Mexico, 100-101.

USEFUL INFORMATION.—Queer Bread Materials; Cheap Tinware; A New Product from Birch Bark; Sharpening Old Files; The Grease Tree of China; To Make a Clear Caoutchouc Solution, 103.

GOOD HEALTH.—Unfavorable Effects of Irrigation; Dangers of Anæsthesis; Hot Water in Anæsthesis; Mortality of Brakemen; The Meaning of Dreams; Singular Surgical Operation; Fear of Disease, 103.

MISCELLANEOUS.—Mexican Duty on Machinery; Wood River's First Smelter, 98. The High Sierra and its Royal Robe, 102. Gold Park Mines, 103.

Business Announcements.

Clayton Air Compressors, Geo. R. Foard, S. F.
Musical Boxes, M. J. Paillard & Co., S. F.
Assay Office Outfit For Sale, John Taylor & Co., S. F.
Dividend Notice—Silver King M. Co.
Dividend Notices—Northern Belle M. & M. Co.

Passing Events.

The Mechanics' Institute fair is now in full blast, and is considered a pronounced success in every respect. The building is well filled with interesting objects, and the attendance is large. These annual fairs are of great advantage to the industrial interests of the coast, which are now progressing at a rapid rate. From the mining regions in every direction we hear of rapid progress. In Idaho there is just now more excitement than elsewhere. The Wood River miners now have several smelters to help them out and more are being put up. The Sawtooth mines are also doing well, and new mines are being found every day.

Arizona still continues to show up new mines; but more new ones are being found than old ones developed. Capital is badly needed down there to develop the really valuable resources of a rich country. New Mexico is now attracting from the East, capital toward its mines, and within the next year or two we may expect many new developments.

As to mining dividends, a point is to be noticed in favor of this State. In looking over the dividends for six months, which we published last month, it is found that California still heads the list, somewhat to the surprise of many who supposed that Arizona, Idaho, Montana, Utah, Nevada, and particularly Colorado, were ahead of the "Golden State." We do not advertise our mining resources as much as some others, as it is an old song with us, and we go on steadily about our business. Some of our neighbors, however, with more mines than dividends, make as much talk as if they needed a mint.

POWDER EXPERIMENTS.—The Touite Powder Co. will give an exhibition of their product, at the works to-day (13th). The train will leave from Oakland ferry at 9:30 A. M., returning at 2:27 P. M. We shall give the results of the experiments in the next number of the PRESS.

Boiler Explosion Test.

Steam boilers are always tested before they are set up, to prove that they are capable of withstanding a certain amount of hydraulic pressure, which is much more than the steam pressure to which it is proposed they shall be subjected when in practical use; but we have never, until the present instance, heard of an experiment, wherein a boiler was subjected to a steam pressure up to its bursting point, for a purely experimental or scientific purpose. Many theories have been put forward as to the cause of the bursting of boilers, when all the conditions have been such that, under the eye of the most careful and skillful engineer, there would seem to be no known reason for such a casualty. Yet such explosions frequently occur, and as a general thing they are the most violent and destructive of that class of casualities. The theory which of late has been the one most generally received, ie that which we believe was first suggested some 25 years ago by Tera Colburn, and which is known as the percussive or concussive theory.

The substance of this theory is, that when the water in a boiler is perfectly at rest, that is, when there is no circulation among the tubes or along the heating surfaces, the water in immediate contact with those surfaces receives an undue charge of heat, which it retains in a latent or quiet state as superheated water, and as quietly transmits the same, until nearly the whole body of water is thus overcharged with heat.

As an illustration, we may cite the well-known experiment of gently heating a body of water covered with a coating of oil in an open vessel, until it reaches a temperature considerably above the boiling point, when, by dropping any small object, like a key or a small pistol ball into the same, a large portion of the water will be instantly converted into steam, with an explosive force sufficient to throw nearly, or quite all, the water from the vessel. The oil, in this case, prevents the circulation and consequent escape of steam and heat which would otherwise be set up.

In a steam boiler at rest with all the valves closed, Mr. Colburn held that this condition might be carried to a much greater extent; so far that, when a large valve is suddenly opened, and the pressure thus removed, the water is as suddenly converted into steam, and with quite as much energy as is manifested by the liberation of the gases confined in a mass of gunpowder when a coal of fire is applied to it, and in either case, no practical amount of pressure will withstand the explosive force.

"When water is thus superheated, the engineer opens the cylinder port, and instantly the steam fills the cylinder, creating a vacuum to that extent over the superheated water in the boiler, a portion of which bursts into steam to restore the reduced pressure, instantly striking every square inch of the boiler with a concussive force many-fold greater than the regular pressure of the steam, and consequently the numerous explosions that occur just as the steam is turned into the cylinder at starting, and before its passage from the boiler has become uniform."

It was to prove the correctness of this theory that Mr. D. T. Lawson, of Wellsville, Ohio, recently undertook the experiments alluded to above, by which he exploded a boiler under a pressure much lower than it was capable of resisting by merely allowing the steam to escape from it by suddenly opening a large valve. At the first trial, the valve was opened at a pressure of 365 lbs., when the pressure was suddenly reduced, but no explosion followed. The water had not reached the proper temperature. The next time the pressure was allowed to reach 380 lbs., when, touching the lever, a rush of steam was distinctly heard, which was instantly followed by a terrific explosion, which tore the boiler into almost innumerable fragments—the plates being ripped into shreds from the size of "a dollar bill to that of a saddle girth." The boiler had previously been tested at an hydraulic pressure of 604 lbs. Mr. Lawson and his party were snugly ensconsed in a "bomb-proof" when the valve was opened.

There need be no wonder at such an effect when the reader calls to mind the fact that the transformation of water into steam calls for 1,700 times increase of space. When this is done by creating a vacuum suddenly, as is the case when a large valve is suddenly opened, or a large quantity of cold water quickly thrown into a heated boiler, the impact and pressure of the particles of steam upon the confining walls can no more be resisted than can the impact of the gases resulting from the explosion of gunpowder.

When there is reason to fear that the water in a boiler has thus become superheated, the only safety is to discharge the steam by very slowly opening the valve to the cylinder, and thus allow the pressure to be removed in such a gradual manner that no sudden impact or concussion can be produced upon the interior walls of the boiler. Every one is familiar with the percussive effect of water, and even a very inconsiderable head, when an ordinary faucet is suddenly opened. The action of steam is still more powerful and violent.

Mr. Lawson also has a theory in regard to the prevention of explosions, which provides for an arrangement for preventing the sudden reduction of pressure in the boiler. The arrangement consists in a boiler constructed with a partition between the flues and the top of the boiler, thus creating a steam compartment over the water compartment, the former to be supplied with steam from the latter through valves in the partition, which valves, to insure safety, must have less area in the aggregate than the area of the port or valve through which the cylinder is fed from the steam compartment. By this arrangement, argues Mr. Lawson, the pressure is kept approximately uniform upon the surface of the superheated water, thus preventing the dangerous concussive force which must always follow a sudden reduction of pressure. Mr. Lawson will soon make experiments with such a boiler with the view of demonstrating that it cannot be burst, the result of which will be awaited with much interest.

The Gold Bluffs and Gold Beaches on our Northern Coast.

More than 31 years have now elapsed since the first discovery of gold in the beach sands on this coast. This occurred at Gold Bluff in 1850, and led to the excitement which, the following spring, carried a great many people to that point. Although the most of these adventurers were disappointed in their expectations, the existence of gold in considerable quantities at that locality was not altogether a myth. The precious metal was there, but it existed in a form and under conditions that made it impossible for these people to gather it with profit. So, after a few fruitless attempts at working these deposits, the business was abandoned, the most of these Argonants returning to San Francisco, whence they came, a few having made their way farther up the coast, or crossed the mountains to the mines on Trinity river, then just beginning to be heard of.

The trouble with these beach deposits was this: The gold which the surf threw up and exposed to view at one time, was covered with masses of barren sand or swept wholly away at another, its stay being too brief to permit the waiting crowd, ill-equipped for the purpose, to secure more than an infinitesimal portion of it at any one time. Then, but little of the gold that the sands contained, could, by reason of its fineness and its being coated with some greasy or gaseous substance, be saved. And so Gold Bluff was, for the time being, pretty much deserted, and its name afterward classed with the traditionary humbugs, of which there were all too many at that day.

But there were those who entertained the belief that where there was so much gold, means could be devised for saving at least sufficient to make the collecting of it remunerative. Of these hopeful ones enough remained to form several small companies who pursued here the business of gold gathering with tolerably good results. These parties having stopped at the original Gold Bluff, and secured there some of the best paying portions of the beach.

In course of time, however, the whole of the beach lying in front of this bluff, some eight miles in extent, fell into the hands of two companies, the one composed of two members, Greenhaum & Chapman; and the other of some six or eight persons, all practical miners. These companies adopted the plan of gathering at low tide the richest portions of the sand, and packing it on animals up beyond the reach of high water, and there washing it in sluices. As each of them owned about four miles of the beach, it seldom happened that they failed to find after a heavy surf, with a favorable wind, some rich sand at one point or another along this stretch of beach, and having grown expert at detecting these deposits when present, and being withal well provided with the means for securing and removing them, these companies made the business pay handsomely. But the locality being remote and difficult of approach, vessels of any kind rarely ever touching, and making no regular landings there, only at long intervals have we been able to hear much about the operations of these companies, little exact information on the subject having, in fact, ever reached the public ear.

From Mr. Allen Heald, of Oakland, who is familiar with this class of deposits, and who, not long since, visited Gold Bluff, traversing the beach thence north, we have some recent and reliable information from this isolated but interesting section of our gold fields. Touching the history and operations of the two companies mentioned, it seems that they or their successors are still the only parties extensively engaged in gathering and washing the auriferous sands at or near the old Gold Bluff.

The Greenhaum company still consists of the two members who originally composed it. The shares of the other company having been bought up by Richard Furnald and Solomon Hall, this property was afterward sold to Adson Adams, the real estate millionaire, of Oakland, Mr. Heald having examined the ground and negotiated the sale on behalf of Mr. Adams, who is now its sole owner. Each of these estates yields on an average about $40,000 per year, of which something like 65% consists of net profits. As Mr. Adams paid but $50,000 for his purchase, he naturally considers the bargain a good one. He has since been offered $100,000 for the mine, but declined to sell at any such figure, believing it a good legacy to leave to his children. Not only so—he finds the locality a pleasant summer resort, and is, at this time, sojourning at Gold Bluff with his family.

The manner of conducting the business of gold gathering at this point is as follows: After a heavy surf the Superintendent of the mine rides along the beach as the tide begins to ebb and carefully notes the condition of the sand, watching for evidence of gold having been thrown up by the waves. If he discovers that fresh deposits have been made he signals the muleteers to that effect, who then rush down their animals and pack out as much of the auriferous sand as possible before the tide again comes in and puts a stop to their work, covering up perhaps the rich streak with a heavy layer of barren sand or possibly sweeping it away altogether.

It is a singular circumstance that when the surf comes square on the beach the gold brought up by it is covered under several feet of this barren sand and, that only when the surf strikes the beach at some other angle, is the gold left on the surface where it can be seen and readily gathered. After being so collected, this rich sand is washed in sluices, small streams of water having been brought in for the purpose. For saving the gold only copper silvered plates are used in the sluices, which are usually run with a light head of water.

On the border of a small lagoon on the Greenbaum ground a short distance back from the beach occurs a large body of low-grade sand. This is run out on cars and washed in an old fashioned "Jenny Lind" tom, being a sluice of one box widened out and supplied with a screen at the lower end.

At one time it was thought that this gold was brought up out of the ocean, an opinion that some people still entertain. But this is clearly a mistake. It came from the bluff in the rear, which is made up of alternating strata of clay, gravel and sandstone. The gravel strata, three or four in number, being all more or less auriferous. The action of the waves has broken down this bluff, which varies from 100 to 500 ft. in hight, and released the gold; the latter having afterwards been by the same agency carried seaward at least as far as low water mark. After a very heavy surf breaking down, as sometimes happens, a portion of the bluff, the beach below is sensibly enriched, the gold by this new addition being rendered somewhat coarser than before.

This fact has suggested the utility of employing powder for breaking down and disintegrating these banks, an agent that will, no doubt, some day be used for that purpose. While the sand along this beach must, under such steady and long-continued working, necessarily suffer a gradual impoverishment, this latter has not, as yet, proceeded far enough here to sensibly affect practical results, a fact due, it may be presumed, to the great width of the beach at this point and to the replenishment which the stock of workable material is constantly receiving from the caving down of the banks above. Farther north, where these favorable conditions did not exist, the gold-bearing beaches have been so nearly exhausted, that hardly any work is now being done, where, from 15 to 25 years ago, thousands of men made good wages.

That the sand, which is constantly covered by the sea, is not very rich has been proven by the trials made on it some years ago with steam dredgers, none of which found gold enough in it to warrant a continuance of these operations.

Each of the companies above mentioned employ from 10 to 12 men and about 18 pack-animals the year round. Operations are kept up with but little interruption, the men being engaged a good part of the time, either in gathering sand or washing it. What time they are not so employed is devoted to cultivating a patch of land in the neighborhood, on which the companies raise some fruits, hay and vegetables for their own use.

Adjoining the Adams claim, which covers the upper or northern half of the beach, a small company is washing these sands by the hydraulic method, using a limited amount of water under a pressure of 80 or 90 ft. From this point north, clear into Oregon, a distance of 30 or 40 miles, very little in this line of mining is being done, though this was at one time along miles and miles of the beach in the vicinity of Whisky Run and the Coquille rivers, an active and profitable industry. Here and there a small company is still to be seen re-working the sands that have already been washed, in some instances several times over, and always with remunerative results, the first one or two washings having generally paid very large wages.

From Mr. Heald, who is himself an experienced, successful miner, we learn that the present has been a prosperous year with hydraulic miners along both the Trinity and Klamath rivers, notwithstanding the water season there, as elsewhere throughout California, has been a very short one. Owing to its freedom from the vexatious debris question and to the presence of good conditions generally, that region of country is strongly attracting the attention of capitalists and others inclined to invest in this branch of mining. Besides great quantities of good gravel, the Klamath country is especially well situated as regards water, which is not only abundant but can be brought upon the mines at small cost and under great pressure, the mountains, the sources of the supplying streams, rising to a great hight directly over the mines. That but little trouble is encountered there from high rim-rock or cemented gravel, may be inferred from the fact that no hauk blasting has ever been practiced nor has a single bedrock tunnel of any length ever been driven in Klamath county; and this, notwithstanding hydraulic mining has been carried on there extensively and successfully for many years. For these and other reasons it costs comparatively little to open up and run a mine of this kind anywhere in this northern region.

A New Form of Girder.

(CONTINUED FROM PAGE 97.)

tom, and the greatest hight 10 inches. Two of 2½ inches diameter wrought iron tie rods anstained the tensile strain. Figure C shows the knuckle joint, the round cast on the center piece, and the socket cast on end pieces, and with the strut cast on same piece, thie latter resting on the bottom on the tie rods. Fig. D shows end of girder. At the top of the arch will be seen a space of 1¼ inchee. Whatever may be the deflection, no parts of the arch, excepting the knuckle joint, touch, so that compression is only exerted on the line of the hottom flange. The cross section of arch (see Fig. B), ie of the Hodgkinson form for straight girder and made to snstain a 16-inch brick wall; consequently, from its broad bearing for the wall, it is largely in excess in compressive resistance to the tensile capacity of the rods. The following is the cost of this girder in San Francisco where materiale and labor are higher than in the Eastern cities and in Europe:

Weight of arch casting, 3,080 lbs., 3½c.	$100.10
Weight of tie rods and nets, 902 lbs., 4½c.	40.59
Fitting 4 bolts and lead	5.50
Drayage and painting	3.00
	$149.19

Had thie been made to snstain 186 tons as a safe load, the breaking load, three times greater—the same casting to be nsed, but to have three of 3 inch diameter rods, it would have cost:

3,080 lbs. casting, as before	$100.10
3 3-inch rods, 1818 lbs., 4½c.	87.78
Other expenses	9.50
	$197.38
Difference	$48.19.

In the experiment at the Pacific Rolling Mills, the other day, this girder was loaded with 117 tone and 1,741 lbs. of railroad iron, the length hetween the supports. Under the weight it dcflected at the joints a quarter of an inch below the true arc. The fonndation on which the girder rested settled seven inches, so that loading had to be stopped. I have no doubt it would have oarried 225 tons, or nntil tbe rods broke. At each of the abntting ends a lamina of lead was nsed to fill in between the castinge, which were not nicely fitted, as the strength at this place wae eo much in excess of reqnirements. This was to make up for the irregular snrfaces, the draft of the pattern making it fuller in the middle in each piece. To make up for the closing np part of the lead when the compressive force was exerted, as well as to straighten the tie rods, when loaded, the arch was cambered three-qnarters of an inch at the joints above the trne arc. The same rule applies to each one of these three sections as that of a continnons arch in one piece of its length; that is, they are subject to a hending moment and a thrust force, and both compression and tension are brought into play, as that of a straight girder, but less of tension than compresion, heing of arch form, as mentioned in a previone part of this article. But it mnst he borne in mind that the compressive force exerted on each of these three short arches or sections of the long arch, equivalent to three small girders, each 7 ft. 9 inches long, is equal to the compressive force of the whole length, 23 ft. 3 inches.

While the compreesive and teneile force transversely exerted is only duo to the load on a length of 7 ft. 9 inches, therefore the compressive force to resiet the tie exerted on a single section of 18 ft. 9 inches, consisting of 8 hays, making the entire length of girder 150 ft., ie eight timee that it would be if the girder was only 18 ft. 9 inches, so by a proper nnmher of hays suitable to the length, this may be so regulated as may beet suit any desired end.

Fig. 1, 2, 3, 4 and 5 are a railroad bridge which may be made 500 ft. in length, and of a euitable number of hays. It will he seen that the top of strut is round and the ends of arch are socketed to meet the round of the strut. Provision is made to prevent the girder raieing by being loaded only on one end with a tendency to raise at the other, as that of a railroad train on the one end. This is effected by the bottom edges of casting pressing together. It will be seen that the ends of arch on ontside enclose the strut. Provision against lateral deflection is made for long spans hy widening the ends where they abnt and enclose the strut. To sustain the bridge floor wrought iron rods, or suspenders, may rnn inside or on outside of the cast iron strut, or a wall on top and floor beams laid on it.

Thie construction weighed in all its bearings Mr. Jackson thinke will be found to be much cheaper for equal strength, than any now in use. Girders of long spans for a hridge can be made as it were in a day, and taken to the place of destination and readily put together. By this mode of conetruction Mr. Jackson is convinced he has found a meane to apply for the world's use the heretofore univereally condemned cast iron, when used for long spans and snbject to cross strain, as well as overcoming the inherent fault caused by the unequal distribntion of the metal cauein weakness if not positive rupture unobservahle, made to exist hy contraction of the metal in cooling. The 25-ft. girder is in front of premiscs, 231 First St., where it may be examined. Mr. Jackeon respectfnlly invites discussion of the engineering world respecting the merits of the device described.

THE July retnrns of the British Board of Trade show a decrease in imports of £1,201,000 and increased exports of £159,000, as against last July.

Contributions to the Geology of California

New Series.—No. 5.

Occurrence of Vanadates of Lead at the Castle Dome Mines.

H. G. HANKS, STATE MINERALOGIST: The occurrence of rare mineral *vanadinite* at the Castlo Dome mines is snfficiently interesting to receive a special notice in this series, although the locality ie just beyond the line of the State, acroee the Colorado river, and in the Castle Dome district, Arizona.

During my recent visit to that district I collected a variety of specimens with the intention of preparing a full memoir npon the speeies, and its association with Wulfenite and the otber beantiful ores of the Castle Dome veins, bnt as the box containing the material hae not arrived I must bo content with sending you this preliminary notice.

Vanadinite, whicb occurs in considerable abundance in the claim known as the "Railroad," is a rare mineral, and has not hitherto been found in the United States, if we except eome minute microscopic crystals mixed with Wulfenite found in tho ores of the Wheatley mines, at Phenixville, Pa., and referred to the species Descloizite, also a vanadate of lead.

The vanadinite occure in groups of hexagonal prismatic crystals with curved sides, tapering at each end, and closely reeembling pyromorphite in form and grouping. These crystale are rarely over one-eixteenth of an inch in diameter, being generally half that size and less than three-sixteenths long. They are in confnsed aggregations, forming crnsts and filling cavities in the decomposing ores of lead, and also on fluor-epar. Some of the crystals are cavernons, presenting the appesrance often seen in phosphate of lead. One eide of a crust of crystale is often in distinct hexagonal oryetale, and the other cousists of an aggregation of minute crystals gronped in arborescent forms, and differing in color from the coarser crystals. The larger crystale are generally light brown in color, with a bronzy luster. The emaller crystals are lighter, and are of various sbades of orange yellow, becomiog in places nearly white with a eilvery satin-like lnster, due possibly to a pellicle of some other mineral covering the surface. The yellowish hrown crystals have a wax-like appearance and luster.

The difference in appearance in the crystalline crusts, their difference of aggregation and color, euggest the probability of several species. It is possible that Dechenite, Descloizite and mimetite are represented; also Eusynchite. The behavior with nitric acid is different, some crystals ehowing a distinct separation of red vanadic acid, and others giving but a slight reaction.

The Wulfenite crystals in association are extremely brilliant and light yellow in color, presenting a beautiful appearance upon a hackground of green fluor-epar, or white crystalline carbonate of lead.

There is great need of investigation of the composition of the many varieties of yellow, red and brown crystals from Castle Dome and Silver district, now usually referred to Wulfenite, though it is probahle that several species are represented.

The Castle Dome vanadinite is totally different in appearance from the red crystale of Silver district. At Castle Dome the vanadinm appeare to be present in varying proportions in the cryetale of different appearance, though all hexagonal, and to he associated with arsenic acid in the mineral species mimetite.

Mimetite.

Some of the specimens giving strong arsenical odors on coal and having the external characters of mimetite or arsenate of lead, give also characteristio reactions for vanadic acid, though not to the same degree, or so distinctly as other crystale where the arsenical reactions are weaker. The strongest reactions for arsenic, so far obtained, are from the crusts of small aggregated crystals of a light brown or straw-yellow color and wax-like luster. The deportment with nitric acid varies, but all the varieties diesolve and give finally yellow solutions, which become green and blue where deoxidized hy organic acide or alcohol. The occurrence of vanadic acid in mimetite is not unknown, Domeyko having fonnd it in mimetite from Mina Grande, Chile.

In all of the specimens so far examined, whether the light yellow, barrel-shaped crystals, or the long, taperiog, hexagonal prieme, or the dendritic aggregatee, reactions for chlorine are obtained, and the yellow nitric solutions hecome green by heating with alcohol.

It is intereetiug to note here that recent researches by M. Bertrand go to show that the hexagonal crystals of mimetite are compound crystals, mado np by twinning of orthorombic crystals. This has been shown by the study of the optical characters. While pyromorphite is truly hexagonal, ehowing only one axis of symmetrical polarization, mimetite was found to have two optic axes. It is poseible that we may find crystals large enough from Castle Dome or Silver district to examine with the polariscope, and ascertain whether they are in reality compounded or siugle.

Vanadinite at Silver District.

Vanadinite also occnrs in beautiful crimson-red crystals in the Hamburg mine at Silver district. Theee cryetals are small, but are beautifnlly distinct hexagonal prisms or "berylloide," being similarly shaped, and are terminated by a flat plane at rigbt angles with the planes of tbe prism. The terminal edges are replaced hy a minnte brilliant plane, and in one or two of the crystals a plane replacing one of the solid angles has been observed. The material at hand is insufficient to give me the best specimens for examination by the goniomoter, so as to accnrately measure the inclination of theee terminal planes to the base or sides. I have, however, mounted one of the minute crystals in hand, and find the angles of the prism apparently equal, so there is little dooht of its truly hexagonal form. The seemingly partial termination or modification of the terminal edges in some crystals raised the question whether, though apparently hexagonal, the trne form might not be rhombic.

The streak or powder of this mineral is salmon-colored or orange red.

It dissolves completely in dilnto nitric acid, bnt in strong nitric acid if added in small quantities, there is a separation of a red powder, which floats of in the acid and is then diesolved, giving a yellow solution, which, after standing some hours, becomes green. It is also tnrned green in a few momente by the addition of a small quantity of alcohol, and this green solution, on boiling, turns blue. These reactions are characteristic of vaoadic acid.

With microcosmic salt in the outer blowpipe flame, we obtain a yellowish green glass, which in the reducing flame is changed to ao emerald green when cold.

Witb borax in the outer flame an olive brown bead results. Strong reactions for chlorine are obtsined by the silver test.

Some of the crystals are light amber colored and are traneparent and some of them aro much darker in color near the terminal plane than at the foot of the prism where it adheres to the gangue.

Vanadic Molybdates.

In the Red Cloud mine at Silver district and likewise at the Silver Glance mine numerous fine specimens of tabular crystals of Wulfenite have been procured from time to time for the past two years. These crystals are often half an inch across, and are from one-sixteenth to one-eighth of an inch thick. The chief peculiarity is their fine red color, very different from that of ordinary molybdate of lead and contrasting strongly with the yellow Wulfenite crystals from the same localities, and from thoee also of Castle Dome. These red crystals I provisionally refer to the ranadiferous variety of Wulfenite. A oomplete analysis is, however, needed to show the compoeition of this and other allied varieties found in other claims at Silver district, notably at the mines opened hy Bamber & Sons—"The Oakland Boys' claim."

The firet red cryetals of Wulfenite observed in the United States were extremely small, being almost microscopic, and were implanted on the ores from the Wheatley mine, at Phœnixville, Pa. They were found by the writer, and the red color wss at firet supposed to be due to chromic acid, but when the mineral was procured in quantity sufficient for analysis, Prof. J. Lawrence Smith showed that the red color wae due to the presence of vanadic acid. The Silver district epecimens now afford sufficient material to permit of a quantitative determination of the constituents.

Octahedral Cryetals.

Beantiful octahedral crystale, of a reddish-brown color, are obtained at the Oakland Boye' claim. I regard these as another vanadic mineral, poseibly a vanadic vsriety of Wulfenite, though the form and the color are so different from the form and color of nndoubted Wulfenite in the same district. I am inclined to regard it as a distinct species, or, at least, a well characterized variety. I regret that tho epecimens I expected have not arrived, thue preventing my making tests and giviog a epecific description.

I am indebted to Mr. Wm. P. Miller, the general euperintendent of the Castle Dome mines and the emelting works at Melrose, for assistance in procuring eome of the specimcne which I have been describing. Some were obtained by me at the minee, April, 1880, and others at the time of my last visit to the mines this past spring. WM. P. BLAKE.

Mill Rock, New Haven, July 29, 1881.

FRESNO MINES.—A subscriber sends ue the following: The mining interest in this district appears to be looking up. The Fresno Enterprise is busily engaged in putting their new mill in order. The Gambetta, on Gruh gulch, ie extracting and sacking a large amount of very rich ore. It is a very rich mine. The Surprise has changed hands. The McDonald Bros. have hought the original locatore out and are pushing the developments with energy. They are down 125 ft., and have a splendid ledge 9 ft. wide. The walls are slate, and are as perfect as they can be, and the ore (which is sulphurets) ie of a very high grade. Tho assays run from $1,100 to $3,100 to a ton of eulphurete. Tho eulphurets average 3%. This mine promises to be one of tho best in the State.

SAYS the *Territorial Enterprise:* Parties proepecting in the lake and deeerted regione for salt, soda, horax, nitrate of eoda, etc., would find a horing machine of great use. It is well known that euch deposits are almost invariably covered with several feet of sand and alkaline soil. To dig through such depoeits in many places is a tedious business, hut with a suitahle horing machine scores of holes might be cheaply sunk.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacifo Coast Inventors.

From Official Reports for tho "Mining and Scientific Press," U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING AUGUST 2D, 1881.

244,977.—ORE CRUSHER AND PULVERIZER—G. F. E. Brinckmann, S. F.
245,129.—VEHICLE SPRING—G. G. Buckland, Tulare Cal.
245,131.—THILL COUPLING—A. Cadwell, Petaluma Cal.
244,991.—HAND RAKE—J. Fox, Alameda, Cal.
245,153.—FOLDING SEAT—Geo. H Fuller, S. F.
245,195.—REFRIGERATOR FOR BEER BARRELS—Messenburg & Wesch r, S. F.
245,229.—FEED WATER HEATER—I. M. SCOTT, S. F.
245,030.—ORE STAMP MILL—Jas M. Thompson, S. F.
245,031.—MACHINE FOR MAKING BLASTING CHARGES—Geo. Trench, S. F.
245,033.—HARROW—VAN GELDER & BATCHELOR—Sacramento, Cal.
245,032.—GRAPPLING OR BALE HOOK—J. M. Vance, Eureka, Cal.
245,038.—MINE DRAINING APPARATUS—Wilcox & Farquharson, S. F.
245,039.—CLOTHES PIN—Jos. Williams, Menlo Park, Cal,
245,251.—REVOLVING DIP NET—T. F. Williams, Lower Cascades, Oregon.
245,041.—CAN FOR EFFERVESCING LIQUIDS—Sam'l. Wood, S. F.
245,255.—STOCK CAR—L. Woodruff, Ellensburg, Gregon.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest poesible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

ORE CRUSHER AND PULVERIZER.—G. F. E. Briockmann, Oakland. Dated August 2, 1881. No. 244,977. This patent covers improvemeots on a previous invention hy Mr. Brinckmaon. These improvemeots coosist in providing a cyliodrical muller, and the oecessary coostruction of the mortar or die in which it is contaioed, to allow of its perfect operatioo. Further, in providing adjustahle roller hearings or pressure wheels, tightened hy set screws and pressing upon the top of the muller for the purpose of preventiog it from rising, whereby he dispenses with the use of the muller or supplementary rollers used io the former pateot, and also does away with the flanges aod plate oecessary to hold the rollers in place. It further consists of a peculiar constructioo of the mortar or die, whereby they may he essily aod readily fitted with shoes; and finally, io a peculiar device for feediog the ore on hoth sides of the machine aud evenly over the exteot of the rollers.

MACHINE FOR MAKING BLASTING CARTRIDGES.—George Frcoch, S. F. This inveotion relates to an improvement in the maoufacture of hlasting charges, and refers more particularly to the mechaoical method of making the charge of the desired form and compactness, and to the machinery for accomplishing this result. In the manufacturing blasting charges which consist of crushed or pulped gun cotton, mixed with any of the nitrates, it is oecessary to suhmit each charge to a heavy pressure aod form it into cylinders of high density, aod some of said cylinders must he perforated to receive the safety fuse aod detonator, hy which the charge is exploded. This treatment is necessary in order to produce the best results in miniog, and the invention is intended to provide a machine hy which the charges are properly compacted and perforated. This iovention has been assigned to the Tonite Powder Compaoy.

CAN FOR EFFERVESCING LIQUIDS.—Samuel Wood, S. F. Dated August 2, 1881. No. 245,041. This iovention relates to a can for holdiog liquids in au effervescent state, whereby their condition is preserved for a considershle time. The object of the iovention is to provide a receptacle smaller and more coovenient than that in which the liquid first comes, ioto which a desired quantity can he drawo, and where it will retain its effervescent quality as fully as if retained in the origioal keg, harrel, or other receptacle. In other words. Mr. Wood wishes to obtain the advantages of an ordinary can or pail, as far as convenience is concerned, and at the same time retain the nse and henefit of the larger vessel as to its capacity to keep the liquid in effervescent condition.

FEED WATER HEATERS. Irving M. Scott, S. F. Dated August 2, 1881. No. 245,229. This iovention relates to that class of heaters which are used to furnish water to steam hoilers, aod are koowu as "feed water heaters." It coosists in a novel srraogemeot of pipes and chambers, through which the water is forced, heing at the time exposed to the heat of the waste steam which surrounds the said pipes. The device has been thoroughly tested and works very satisfactorily.

THILL COUPLING. Alexander Cadwell, Petaluma. Dated August 2, 1881. No. 245,131. This invention consists in certain details of construction in thill couplings. The object is to secure the holt tightly, whereby all rattling is prevented and the danger of loss and accideot averted.

An Inventor.

The Trouble He Causes His Wife by His Various Devices.

"It is all very well to talk about working for the heathen," said one, as the ladies of the circle put aside their sewing, "but I'd like to have some one tell me what I'm to do with my husband."

"What's the matter with him?" asked a sympathetic old lady.

"William is a good man," continued the first, waving her glasses in an argumentative way, "but William will invent. He goes inventing around from morning till night, and I have no peace or comfort. I didn't object when he invented a fire-escape, but I did remonstrate when he wanted me to crawl out of the window one night last winter to see if it worked well. Then he originated a lock for the door, that wouldn't open from midnight until morning, so as to keep burglars out. The first time he tried it he caught his coat-tail in it, and I had to walk around him with a pan of hot coals all night to keep him from freezing."

"Why didn't he take his coat off?"

"I wanted him to, but he stood around til the thing opened itself trying to invent some way of unfastening it. That's William's trouble. He will invent. A little while ago he got up a cabinet bedstead that would shut and open without handling. It went by clockwork. William got into it and up it went. Bless your heart, he stayed in there from Saturday afternoon till Sunday evening, when it flew open and disclosed William with the plans and specifications of a patent wash-bowl that would tip over when it got just so full. The result of that was I lost all my rings and a breastpin down the waste-pipe. Then he got up a crutch for a man that could also be used as an opera-glass. Whenever the man leaned on it up it shut, and when he put it to his eyes to find William, it flew out into a crutch and almost broke the top of his head off."

"Don't any of his inventions amount to anything?"

"He says they do. Once he invented a rope-ladder to be worn as a guard-chain and lengthened out with a spring. He put it around his neck, but the spring got loose and turned it into a ladder, and almost choked him to death. Then he invented a patent footbeel to crack nuts with, and gave it up. His coal-scuttle has made more trouble than anything else. It was rivetted to the grate, and, when the fire got low, it would turn over and pour on coal. The rivets got rusty so he couldn't get it off, and I just sit up in bed and listen to that scuttle all night. Then he arranged a corn-popper so it would wiggle itself, and now he can't stop it. You can hear that popper going around in the closet, and he won't let me throw it away, because he wants to invent something to hold it still. Why, he has got a washtub full of inventions. One of them is a prayer-hook that always opens at the right place. We tried it on one morning at church, but the wheels and springs made such a row that the sexton took William out by the collar and told him to leave his fire-engines at home when he came to worship. The other day I saw him going up the street with the model of a grain elevator sticking out of his hip-pocket, and he is fixing up an improved shot-tower in our bed-room."

"Does he make any money out of his inventions?"

"He doesn't appear to. The other night a man came down and wanted William to get up a patent umbrella fastening. Since then he has wrecked all the umbrellas and parasols in the house. We haven't a thing to use if it should rain. Now he is at work on a combined cat-and-rat-trap. The cats and rats go in at different ends and eat each other up—at least, he says they will; and after that he is going at a pair of pantaloons, in which a man can fall down without spraining his leg. William means well, but he has got the mania for inventing, and I don't know where it will end." And the old woman sighed as she started for home to see what new inconvenience her ingenious husband was preparing to perpetrate.

HIGHLAND SPRINGS,

LAKE COUNTY, CAL.

BEAUTIFUL AND HEALTHFUL SUMMER RESORT FOR FAMILIES, INVALIDS, CAMPERS AND PLEASURE SEEKERS.

Hotel and Cottages Newly Furnished.

Board and Room, $10 per week, including Mineral Baths Children under 6 years, and Servants, Half Rates.

Direct route by steamer "Donahue" to Donahue Landing, connecting with S. F. & N. P. R. R. to Cloverdale, thence by Stage to Highland Springs.

The springs are situated at an altitude of 1,700 feet above sea level; and for natural beauty of scenery, healthful climate, hunting and fishing, are unsurpassed in the State. The surrounding forests and valley are particularly inviting to campers, who will be especially entertained at the Springs.

The waters have produced many wonderful cures in the following diseases: Dyspepsia, Paralysis, Erysipelas, Rheumatism, Sciatica, Liver and Kidney, Bronchitis, Pulmonary Complaints, in their early stages General Debility, and a never-failing remedy for Chills and Fever.

For further particulars, address

MRS. J. C. GOODS, Highland Springs.

SECURE PATENTS

Through Dewey & Co.'s **Scientific Press** Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

THE O'HARRA

CHLORIDIZING FURNACE.

Patented in 1878.

SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1 10 per ton to work 40 tons in 24 hours.

At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61½.

Lewis Chalmers, of the Isabella G. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenial sulphurate of silver up to from 84% to 95% of the assay.

SEND FOR DESCRIPTIVE CIRCULAR TO

WHITNEY, VEASEY & CO.,

Carson City, Nevada.

Agents for San Francisco, KUSTEL & CO., 318 Pine Street.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. Triple Force Caps and all Grades of Fuse.

JOHN A. CHURCH, E. M. PH. D.

MINING ENGINEER,

Room 75, 115 Broadway, New York.

Agent for PADDOCK'S Ore Dressing Machinery. Mining Machinery supplied.

San Francisco Cordage Factory.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisa Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

TUBBS & CO.,

611 and 613 Front Street, San Francisco

ANDERSON'S SPRINGS,

LAKE COUNTY, CAL.,

Nineteen Miles from Calistoga.

Hot Sulphur Water for Rheumatism, Paralysis, etc. Cold Sulphurs for Diseases of the Bowels and Stomach; Climate Beautiful; Scenery Magnificent; Abundance of Trout Fishing; Good Cooking. Board, $10 to $12 per week.

ANDERSON & PATRIQUIN, Proprietors.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 58.

Metallurgy and Ores.

WM. D JOHNSTON,
[Formerly Chief Assayer with Thos. Price.]
ASSAYER AND ANALYTICAL CHEMIST,
118 & 120 Halleck Street,
Near Leidesdorff, SAN FRANCISCO.
ASSAYING TAUGHT.
Personal attention insures Correct Returns.

Nevada Metallurgical Works,
No. 23 STEVENSON STREET,
Near First and Market Streets, S. F.
ESTABLISHED, 1869. C. A. LUCKHARDT, Manager.
Ores Worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, Etc.
Working Tests (Practical) Made.
Plans and Specifications furnished for the most suitable process for working Ores.
Special attention paid to Examinations of Mines, plans and reports furnished.
C. A. LUCKHARDT & CO,
(Formerly Huhn & Luckhardt.)
Mining Engineers and Metallurgists

JOHN TAYLOR & CO.,
IMPORTERS OF AND DEALERS IN
Assayers' Materials,
MINE and MILL SUPPLIES,
CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, Etc.
118 and 120 Market Street, and 15 and 17 California St., San Francisco.
We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.
Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grams and grammce, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

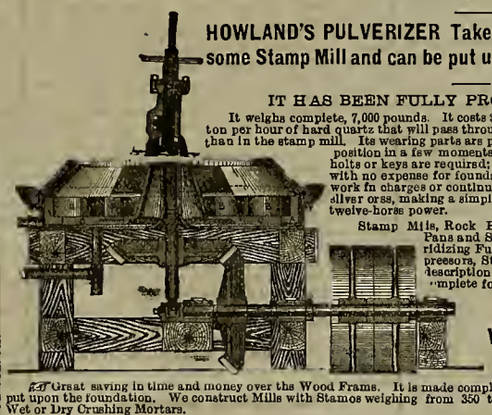
NEW YORK METALLURGICAL WORKS,
104 and 106 Washington St., N. Y.
ORES CRUSHED AND SAMPLED, AND WORKING TESTS MADE BY ANY PROCESS. ASSAYING IN ALL ITS BRANCHES. ANALYSES OF ORES, PRODUCTS, MINERALS, ETC.
Assaying and Metallurgy of Silver taught theoretically and practically.
Examination of mines and the starting and running of reduction works a specialty.
French, German and Spanish spoken.
MATHEY & RIOTTE, M. E., & MGT.

SHEET IRON PIPE.
FRANCIS SMITH & CO.,
Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand
SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Arteeian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.
SHEET IRON PIPE.

PACIFIC MACHINERY DEPOT.
H. P. GREGORY & CO.,
Nos. 2 and 4 California Street, San Francisco.
Importers and Dealers in every description of
MACHINERY!
Sole Agents for the Pacific Coast for

BUCKEYE Engine Company.
J. A. Fay & Co.'s Wood-Working Machinery; Bement & Sons' Machinists' Tools; Blake Steam Pumps; N. Y. Belting and Packing Co.'s Rubber Goods; Sturtevant Blowers and Exhaust Fan; Tanite Co.'s Emery Wheels and Machinery; Payne's Vertical Engines and Boilers; Perry's Centrifugal Pump; Judson's Standard Governors; Dreyfus Self-Oilers; Gould M'fg Co.'s Hand and Power Pumps; Eclipse Windmills; Disston & Sons Circular Saws; Otto Silent Gas Engine; Ducs' Elevator Cups; Ballard's Oak Tanned Belting.
Also on hand and for sale A FULL LINE OF MILL AND MINING SUPPLIES.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and O, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supplies Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
Great saving in time and money over the Wood Frames. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

LEFFEL'S IMPROVED WATER WHEEL.

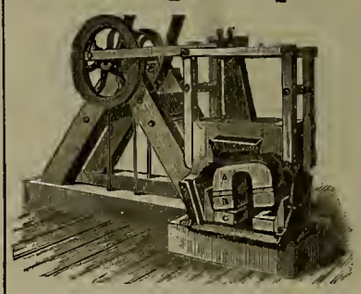
PRICES REDUCED!
PATENTS REISSUED 1868.
The "OLD RELIABLE" with Improvements, making it
THE MOST PERFECT TURBINE NOW IN USE.
Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.
Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address
JAMES LEFFEL & CO., Springfield, Ohio, and 110 Liberty St., N. Y. City.
PARKE & LACY, Sole Agents, 21 and 23 Fremont St., S. F.

STEEL CASTINGS
FROM 1-4 TO 10,000 lbs. WEIGHT.
True to pattern, sound and solid, of unequaled strength, toughness and durability.
An invaluable substitute for forgings or cast-iron requiring three-fold strength.
Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.
15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.
CRANK SHAFTS, SHOES, DIES and GEARING specialties.
Circulars and Price Lists free. Address
CHESTER STEEL CASTING CO.,
Works, CHESTER, Pa. 407 Library St., PHILADELPHIA

IRRIGATION! LAND RECLAMATION.
The Turbine Pumps.
3,000 to 15,000 Gallons a Minute. Strong, Durable & Cheap.
SAN. FRANCISCO TOOL CO., No. 21 Stevenson St., San Francisco.

SELBY SMELTING and LEAD CO.,
416 Montgomery St., San Francisco.
Gold and Silver Refinery And Assay Office.
HIGHEST PRICES PAID FOR
Gold, Silver and Lead Ores and Sulphurets.
Manufacturers of Bluestone.
ALSO, LEAD PIPE, SHEET LEAD, SHOT, ETC.
This Company has the best facilities on the Coast for working
GOLD, SILVER and LEAD
IN THEIR VARIOUS FORMS.
PRENTISS SELBY. - - Superintendent.

HUNTINGTON'S Oscillating Stamp Mill



It has no Steme, Cams, or Tappets, and Adjusts Itself to the Wear of the Shoes and Dies.
For Simplicity, Economy, Durability and Effective Working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power.
Price, 900-Pound Hammer, - - - - $500.
" Double Mills, - - - - - - $950.
Price, 1200-Pound Hammer, - - - - $600.
" Double Mills, - - - - - - $1150.
Send for Circulars and Testimonials.
SHINGLE MACHINES AND SAW MILL MACHINERY, STEAM ENGINES, ETC., TO ORDER. MINING MACHINERY OF ALL KINDS.
F. A. HUNTINGTON,
220 Fremont Street, San Francisco.

DuBOIS' Automatic Quicksilver Feeder.
A machine for feeding quicksilver to the mortars of GOLD MILLS. It is so connected to the cam shaft, that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a mechanical movement, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding ordinary hand-feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect. Price complete, $100.00. Send for circular.
P. C. DuBOIS,
18 Fremont St., S. F.

ALEX. DEL MAR, Mining Engineer.
Formerly Director of the Bureau of Statistics of the United States; Superintendent of the United States Special Commissioners of Mines; Member of the Committee on Mines at the Congress of Nations held in St. Petersburg, Russia; Mining Commissioner for the United States Monetary Commission; author of a History of the Precious Metals, etc.
216 Sansome St., San Francisco.
Mining properties surveyed and reported upon; assays and qusutitative analyses made of ores etc.

OTTOKAR HOFMANN,
(Of the Firm of Hofmann Bros.)
Metallurgist and Mining Engineer.
Erection of Leaching and Chlorination Works a specialty
Working Tests and Reports made.
415 MISSION STREET, SAN FRANCISCO.

WIND MILL. One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.

Oration at Opening of Mechanics' Fair.

We gave last week a report of the opening exercises of the Mechanics Institute fair, but held over for want of space the able speech of W. W. Morrow. This we give herewith with the exception of the remarks on cable roads in San Francisco, which we keep for a future occasion:

Mr. President, Ladies and Gentlemen: A distinguished English visitor, after six weeks of travel in the United States, recently arrived in San Francisco.

He was of course duly welcomed, and asked the usual question as to his opinion of the country and its institutions. His reply was a candid confession that he did not feel competent to pass judgment on the affairs of a country, based upon observations made from the window of a railroad car.

The embarrassment of our English friend can be fully appreciated by any one who will attempt to gather and arrange statistics concerning our present progress in the mechanical arts and mechanical and agricultural productions. We are speeding along so rapidly through depressions and over altitudes that broad fields of facts, on either side of us, drift away before we can note their character or determine even their location.

The careful and conscientious student desiring to determine accurately the value of these vast industrial fields, must stop and proceed patiently and systematically to investigate details, before he can render a judgment that shall comprehend all the elements that go to make up the material wealth and prosperity af a country.

Happily no profound discussion of any question in which you, as friends of the Institute, are interested, is called for on this occasion. I shall therefore content myself with a few obvious comparisons and illustrations to prove what everybody already knows, that we are in the midst of progress, and the future is full of promise.

The Mechanics' Institute.

I learn from the reports of the officers of the Mechanics' Institute that it was founded on the 6th day of March, 1855, and that the first exhibition held under its auspices was inaugurated on the 7th day of September, 1857.

In the announcement made by the Managers of the Institute some time previous to the first exhibition, the influence of the proposed enterprise was expressed in strong and hopeful language. It was said: "The advantages of fairs must appear obvious to every reflecting mind; and in no quarter of this globe do they promise more than in California, where so much may be accomplished by the dissemination of correct information relative to her natural and artificial resources. Besides exciting emulation, extending practical knowledge, suggesting ideas to ingenious minds, affording tangible evidence of superiority, stimulating talent, exhibiting the progress of the arts, promoting extensive intercourse among producers and their patrons, they cannot fail to excite a world-wide interest in regard to our State, and extend reliable information respecting its resources, which will tend to encourage immigration and permanently establish beneath our genial skies an industrious, enlightened, prosperous and happy population."

It is pleasant now to note the sanguine expectations of the originators of these splendid exhibitions, and know that they have been more than realized. And the occasion of the opening of this, the Sixteenth Industrial Exhibition, seems a fitting opportunity to consider the progress that has been made in California, and particularly in San Francisco, in the last 24 years in those departments of industry with which this Institute is intimately connected.

Progress of the State.

In 1857, the excitement caused by the discovery of rich placer mines nine years before in the lower ranges of the Sierras, had about run its course with the exhaustion of the surface deposits.

The more restless of the adventurous miners had either departed for their Eastern homes or were searching for new El Dorados.

The Comstock was yet unknown.

It was a period when the future of the State seemed uncertain, but there was a large number of energetic and enterprising young men who determined not to abandon, without further trial, a country which, in their eyes, gave promise of a great future.

A few farmers scattered here and there over the State had demonstrated that its broad sunny valleys were capable of producing large crops of grain of all kinds, while fruits and vegetables of every description grew in abundance.

During the year ending July 1, 1857, a larger crop of wheat, barley and oats had been grown than was necessary for home consumption, and a surplus of less than 40,000 bushels of wheat, 140,000 bushels of barley, and about 26,000 bushels of oats was exported. The wheat found a ready and profitable market abroad. The fact was suggestive, and gave encouragement that while the glory of our mineral wealth might suffer as the product decreased, there was wealth in the soil that would give the State a more enduring and a far brighter fame.

An agricultural community meant an abiding and industrious population requiring manufactures to supply its various and constantly increasing wants. This was the theme of the first Industrial Exhibition held in San Francisco.

What has the harvest been? The wheat and flour exports from California since then have reached the enormous figures of one hundred and thirty millions of rentals, or the equivalent of more than two hundred and sixteen millions of bushels. The export of wheat last year alone amounted to more than fifteen million centals, or twenty-five millions of bushels, while the total production probably exceeded thirty millions of centals, or fifty millions of bushels.

The barley crop has been estimated to exceed 5,000,000 of centals; the wool crop at 46,000,000 of pounds, and the wine product at 12,000,000 gallons.

It would weary you to go through the whole list of productions, but enough has been stated to show how generously the soil and climate have responded to the predictions made 24 years ago.

Now, what has the patient, hard-working mechanic been doing all these years? There are no statistics at hand showing the extent of the manufactures in San Francisco in 1857, for this kind of industry was then in its infancy. The Assessor of this city and county reports that the total value of manufactures in San Francisco during the year 1880 was $72,364,680, and that the number of men, women and boys employed was 28,232. This is an increase over the year previous of $2,869,800 in the value of articles manufactured, and 2,671 in the number of men, women and boys employed.

Is it a ny wonder that the pavilion used for the first exhibition, covering less than a half an acre and giving floor space of only 20,000 square feet, has given place to the present magnificent structure covering more than four acres of ground, and furnishing floor space of 175,000 square feet? We are not surprised either when we are told that the present building must give away to still another, and that before the time comes around for the next exhibition, a permanent building is to be erected of such grand proportions and architecture as to be at once the pride of the city and the glory of the State.

All honor to the public-spirited gentlemen who founded the Mechanics' Institute. All honor to their successors, who have supported and carried it forward to the important position it now occupies, as a substantial power in developing the mechanical industries of the city and State.

"Mind acting through the useful arts," says Mr. Everett, "is the vital principal of modern civilized society."

"The mechanician, not the magician, is now the master of life. He kindles the fires of his steam engine, and the rivers, the lakes, the ocean are covered with flying vessels; mighty chain-pumps descend, clanking and groaning, to the deepest abysses of the coal mines, and rid them of their deluge of waters; and spindles and looms ply their task as if instinct with life. It is the necromancy of the creative machinist." This was said forty-four years ago, and it makes one curious to know what graceful thought would have been suggested to the eloquent orator by the wonderful machinery that now lifts the water from the profound depths of the Comstock lode. How much more, too, would he have been impressed with the great and all-pervading power of mechanic arts as they have since been developed in all departments of industry!

If we examine the discoveries of the past centuries and compare them with the inventions of our own times, we feel a pride in pointing out where the genius of man has triumphed here and there in solving some great mechanical difficulty, and we are often surprised, when the problem is solved, to find it had not been done before.

The expansive power of steam was known long before Watt put it into the form that has developed into the modern steam engine.

The electric current was known and recognized by the ancients, but who among them ever dreamed of applying it to the uses of to-day—the telegraph, the telephone, the phonograph, or the commercial light?

The principles involved in the power and pressure of water have been more or less understood and utilized for centuries, but it was the modern inventor that adapted those principles to the hydraulic lift, the hydrostatic engine, and the hydraulic nozzle.

And so with innumerable things in innumerable ways, genius, necessity and opportunity separately and jointly have supplied, improved and invented.

Inventive Genius in California.

In points of mechanical invention and adaptation California has no need to feel ashamed of her record, and when we consider that the predominating influences here have not been favorable to deep thought and careful study, except as exigencies have arisen which momentarily commanded concentration of mind, the many evidences of genius among our mechanics and thinking men invoke admiration and satisfaction.

In some of the modern inventions California, perhaps, furnishes some of the best examples that can be found of improvements in the use and economy of forces. This is entirely natural and reasonable, when we remember that our population was not the result of growth upon the soil. We were all Topsys—"Never was born; never had no father, nor mother, nor nothin'. I was raised by a speculator, with lots of others." Our raising seems to have shaped our character. Nature appeared to us strangely accoutered, and to subdue it quickly and effectively, we have sought for the best weapons we could find.

A friendly critic said of us a few years ago that we appeared like a bran-new people with a bran-new country. He saw no evidences of a former generation. No old people, no ancient places, no antique things, no relics. It was as though in the school of events it had been determined to try the experiment of placing a perfectly clean slate (not a political one) in the hands of a new generation of men, and requiring them, without rule, direction or copy, to work out the sum of all their capacities. With such a people there was no prejudice against new appliances.

The farmer commenced work without old tools and of course he was anxious to get the best of the new. The miner was obliged to invent new machinery to enable him to search for the hidden treasure or he must abandon the pursuit. The prize was a glittering one, and he began to think. When a full-grown man, accustomed to toil and struggle, is urged by a powerful incentive to think, he generally goes direct to the point. He may grasp his subject awkwardly, and even fail to comprehend it; but the chances are that he will break through some mystery by force and reach a truth, the road to which will afterward be explained by the scholar on strictly scientific principles.

The Miners.

The California miners have done wonders in increasing the power of man's agencies in the search for the precious metals.

In 1852 it occurred to a Placer county miner that the pressure of water might be used in working a gravel claim. He accordingly placed a barrel in some convenient place high above the ground he desired to work. Into the barrel he led a small stream of water and made a reservoir. From the barrel to his claim he stretched a hose made of common rawhide, and ending in a four-foot tin tube, the nozzle of which was one inch in diameter. This cheap and simple contrivance proved to be equal to the labor of several men in removing the earth and washing out the gold, and was the origin of what is now known all over the world as hydraulic mining.

The need of a large quantity of water under heavy pressure for this kind of mining has required its conveyance for long distances around mountains and across deep gorges. Here the inventive genius of the miner has enabled him to overcome difficulties which at first seemed insurmountable. The old heavy metal pipe could not well be secured and supported at a great hight; but by successive improvements a thin sheet-iron pipe takes its place, and may now he seen suspended across gorges nearly 2,000 ft. in depth.

At the mine where the water is used it is now discharged from an ingeniously contrived nozzle, under a pressure that makes the stream as rigid as a bar of steel. It plays with huge bowlders as a child would play with marbles, and yet it is as easily controlled as the water faucet in your chamber basin.

What a marvel of power and convenience has been developed since that first experiment in 1852. But here I am assailed by a distressing douht. Has all this power and mechanism been entirely beneficial? I fear that it has not. The miner has been expeditious and successful in scouring the hills for gold, but what has become of the mountains of earth he has washed down? This is dangerous ground. It has been said that rivers have been filled up and large tracts of agricultural land destroyed hy it. It is said also that under the aggressive name of *debris* it has found its way into the halls of legislation and produced fearful havoc in the political and financial affairs of the State.

If all this is true we must find either an engineer or politician—if he has not been found already—who will have the genius to follow up the inventions and improvements in this branch of industry with some new and effective device that will make the hydraulic miner an unqualified blessing, or abolish him altogether.

The quartz miner has also done much in improving the methods and machincry long used for extracting and crushing ores.

For three or four hundred years the ponderous looking stamps used in the quartz mills of mining countries and brought here when quartz mining first commensed, were bobbing up and down in a most ridiculously ineffective manner. The stamp used was square and had a square wooden sbaft, and the whole was lifted by a cam (usually also of wood), working in a long cut in the square stamp-head. Some bright fellow in the mountains, having no reverence for this aged contrivance, gave it new youth and vigor by substituting iron for wood, and a cylindrical shaft and stamp-head for the square apparatus.

He thus simplified the construction of the several parts of the stamp, and by then giving it a rotary motion made the shoes which crush the rock wear uniformly, and that is your quartz mill of to-day.

This was an exceedingly simple but valuable improvement, and the great wonder is that it was not made before.

As early as 1854 the hydraulic jack was employed hy an ingenious mechanic in this city for raising massive buildings. Since then the same method has been used in Chicago and other large cities for a like purpose.

A small stream of water conducted through small pipes to numerous hydraulic jacks has quickly, steadily and silently done the work which would otherwise have required the employment of a large force of men in a slow and dangerous operation.

The feature of the day, and that which strikes an observer most forcibly, is the application of well-known scientific principles in simple, easy ways for the performance of work about the foundry, the machine shop, the mill or the factory. Turn where you will and you will find some simple device which solves a problem, the solution of which has cost hours of thought and patient application. So simple and obvious are many of these modern scientific improvements to machinery that one can hut wonder at the delay in applying in practice a knowledge of principles which have been understood so long. Only the other day I saw in an engine room of one of the large mills in this city a contrivance which was represented to be simple, and it so appeared.

It was certainly very useful, and the explanation I had of it was so interesting I determined to make a note of its operation.

Within a huge steam cylinder, under a pressure of from 80 to 100 pounds to the square inch, a piston traverses from end to end, according to the speed of the engine, perhaps fifty, sixty or seventy times every minute. Each square inch of the circumference of the piston bears closely enough upon the interior surface of the cylinder during its rapid movements, to prevent the passage of the subtle steam even under the tremendous pressure which is required to furnish the power for all the motion in this large establishment.

To maintain this great speed with economy of power and safety, the constant and regular introduction of some lubricant is necessary, but the place in which it is required seems inaccessible.

The problem of how to do this in the most satisfactory manner was solved by a San Francisco mechanic, and the whole principle involved was the simple one of specific gravity.

The whole world has always known that oil was lighter than water; hut it was only recently that this knowledge was made use of to introduce oil into a cylinder against a pressure of 100 pounds to the square inch.

Do you ask how it was done?

The inventive mechanic tapped the feed-pipe of the cylinder and led a small pipe from this point by a circuit of a few feet to a point in the same feed-pipe nearer the cylinder. Midway in this second pipe he interposed an oil cup. The oil, subject to a pressure each way equal to the cylinder pressure, be it what it may, is in a state of equilibrium. But the effect of conducting the steam to the cup in the small pipe is to give it an extra exposure to the air and produce a slight condensation of steam into water. Each drop of water as it trickles from the pipe and settles into the oil cup, displaces a drop of oil, which immediately rises and is carried through the circuit and into the cylinder with the steam, where it performs its intended office. So simple, so perfect, so successful and economical was this device that it did not seem capable of improvement. And yet some bright, ingenious mechanic saw that the thing was not complete; that in the hands of a shiftless man even this device might be used wastefully. To him occurred the idea that a glass tube filled with water might be interposed, forming a part of the return pipe, from the cup to the cylinder, and thus, each drop of oil as it proceeds on its errand might be compelled to reveal itself to the engineer.

Need I say that it was exceedingly interesting to stand by that cylinder, feel its mighty throb, realize the enormous power it exerted, and observe through the simple glass tube just described, the drops of oil hastening on with accuracy and dispatch to perform their appointed duty?

Our Material Resources.

If it now appears that we have an abundance of mechanical genius in this State, the next question of interest is, have we the material in the soil on which to found a large and comprehensive industry? Has nature provided large sources of water-power and stored up heat in forests of timber and fields of coal? The question is answered in a word.

The water-power of the western slope of the Sierra has been estimated to exceed that of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey and Delaware.

This tremendous force is now employed in only a limited way hy the hydraulic miner, while in the winter season it spends itself extravagantly in flooding the valleys below.

The time will soon come when the hundreds of miles of ditches, canals and flumes that now line the mountain sides for mining purposes will be utilized, and their capacity increased to supply power for manufactories.

The immense forests of timber found in the Coast Range and Sierras should be a source of untold and lasting wealth to the State in supplying lumber for building purposes, material for all kinds of woodwork and fuel for mills and factories, but, unfortunately, the lumberman, although enterprising and liberal, is plying an exceedingly wasteful trade. He plants his greedy sawmill in the forest beside the river, and immediately enters into a conspiracy with steel and water to carry on a work of destruction. The splendid groves that nature required a thousand years to rear in their sublime grandeur are prostrated in a few days. The choice portions of these great trees are soon converted into lumber, but the remainder is too often burned or allowed to rot upon the ground.

There should be more economy exercised in supplying our present wants from these ancient woods, for the time may come when every stick of wood a foot long will have a commercial value.

The present very able and energetic President of this society can tell you more about the coal fields of this State and coast than I can, and I have no doubt hut that I would express his knowledge on the subject in a business-like way by saying that they are well nigh inexhaustible.

It is proper to say, however, that it was at one time supposed that the lack of large deposits of good coal was one of the few things wanting to found in this State a great mechanical industry.

The discovery of tertiary coal fields—a more recent formation than the anthracite or bituminous coal—and sometimes improperly called lignite, was considered as an indication that the older and better series would not be found on this coast. I remember the charming excuse that was made some years ago that Nature had been so busy making gold and silver she had not had the time to complete her manufacture of coal and we had surprised her in the act. This is proven to be only partially true, for the quality of our coal improves with each new discovery, until now, for smith purposes as well as for fuel, our home product promises soon to supply all our home demands.

Prospectors also report discoveries of coal of a quality that will yield excellent coke and hard coal suitable for the forge. The consumer is thus assured that all his wants in this respect will soon be fully supplied in both quantity and quality by home production.

At this point the pleasant duty devolves upon me to make the announcement of an event of more importance to the people of this coast than the result of an election or the birth of a prince. And yet it is indeed the birth of a king that I am called upon to proclaim to you. A king wielding an influence more potent than gold, and hearing in his hands the scepter of an absolute power.

In order that the advent of this new dynasty may be properly recorded in the annals of the State, let us notice with some particularity that at 4 o'clock on Sunday morning, April 24, 1881, the first iron ever made in California was run from the furnace. The event took place in Placer county, and the locality is named Hotaling, in honor of the well known San Francisco merchant, who, with Irving M. Scott (a former President of this Institute), and Egbert Judson were the founders of this enterprise.

The establishment is under the superintendence of James M. White. It produces 25 tons of iron per day, and as it has now been in operation just 100 days its production has been 2,500 tons. As the supply of ore, fuel, and other materials required is practically inexhaustible, the manufacture of pig iron may now he considered a permanent business in this State. The King has been installed. Long live the King! But you may ask why is this an exceptionally important event in California? The question is easily answered. It is because iron enters so largely and generally into the Mechanic Arts that they can scarcely be said to exist without it. And the lessons of all the years since 1849 have been that we must make use of the original materials that have been so generously supplied by nature, work them into what is called raw materials, and in the manipulation of the latter become manufacturers, or we will lose through competition all the advantages we gain in other departments.

Foreign burlaps and machinery deprive our farmers of a considerable profit on their grain crop, and so it is in many other branches of business.

Any community that obtains its raw materials from abroad is at best hut a vassal of some other section, while every addition made to its products is a link severed from the chain of dependence that binds it, however unwillingly, to a distant and perhaps an unfriendly interest.

The manufacture at home of a good quality of pig iron liherates us at once from the domination of the foreign metal markets, and makes possible the manufacture of many things of vast importance to the people of this coast. Iron plates suitable for shipbuilding ought to be made here. This would enable the Pacific coast to build and own a fleet of ships that could control the coast and foreign trade in the interest of home capital and enterprise.

Then would arise a demand for skilled as well as unskilled labor, and by cheapening construction extend the area to be supplied, build up commercial trade, protect our merchants, and add another solid block to the foundation upon which our future greatness will rest.

The Mechanic.

The next, and by far the most important factor to be considered in any estimate of our future success in the manufacturing enterprises, is the mechanic himself, for without him all these calculations are idle and useless.

The question is, does this State furnish an inviting field in which the mechanic can work out the problem of a comfortable existence?

This has been a serious question in the presence of a constantly increasing foreign horde, rapidly monopolizing all departments of labor; but the recent ratification, by both parties, of a treaty between the United States and China, under which the United States is permitted to restrict this non-assimilating immigration, gives us hope to believe that this vexed question will soon be settled in favor of the Caucasian race.

Let Congress act promptly and effectively under the treaty stipulation, and put a stop to this invasion. The immense number of arrivals by every steamer warn us that action cannot be had too soon, and we look to our Representatives in both Houses of Congress for a determined effort in that behalf. With this question settled, the mechanics, and, in fact, all classes, will feel more contented. Agitation will necessarily cease when the cause for it is removed, and capital will return to its accustomed channels. Our young and active boys will be encouraged to learn some useful trade when they know they will not be driven from their employment by a race with whom they cannot compete on any narrow ground in a contest for existence.

There does not seem to be any just reason why this State should not be the best place in the world for the mechanic, and I believe it will be so demonstrated very soon; but there must be an effort made to attain excellence in workmanship before there can be any successful competition with the manufacturers of the East and Europe.

And here it is that the influence of this Institute should he made aggressive and effective. The society is to be congratulated for the splendid work it has already accomplished. Its library of over 30,000 volumes of choice literature, including the best collection of scientific works on the coast, is a matter of just pride. The courses of lectures it has furnished to its friends and patrons have been exceedingly beneficial, and the whole State has eagerly watched the improvements, encouraged and developed by the periodical exhibitions given under its auspices. But something more should be done in the direction of education. Our young men and boys need counsel and instruction, and I am glad to know that I but reiterate the opinion of the present officers of this society and their predecessors when I say that there should be some further means employed for imparting instruction in the mechanical or technical arts.

We have arrived at a point in the development of the resources of this State where the best appliances must be used and the most skillful workmen employed, if we expect to keep pace with the world at large.

The fruits that grew near at hand have all been gathered, and we must now reach and climb for that which is beyond our immediate grasp.

The first miners found gold near the surface, and generally separated it from the earth without the assistance of much machinery, or if any was used it was of the most simple character. But now we find the miner, as he pursues the receding metal into the mountain, assisted by the most complicated and powerful machinery on the globe, while he himself has developed a genius in the pursuit and a skill in controlling and directing his mechanical agents. And so it is in nearly all departments of industry. What the State wants now is men specially trained and skilled in their respective callings. Here again we have the raw material in abundance.

Our boys require just this training to make them safe citizens and capable of becoming a power in the great forces of the world. It is the men who labor in some legitimate industrial pursuit that furnish the muscle and the muscular brain—if I may be permitted to use the expression—to blaze pathways into the mysterious depths of nature and nature's forces.

News in Brief.

DIPHTHERIA prevails at Sawyer's Bar, Siskiyou.

JOHN CLARK, once Surveyor-General of Utah and New Mexico, is dead.

THE ship *Trafalgar*, 123 days from Antwerp, loaded with railroad iron for the California Southern railroad, arrived at San Diego Saturday.

THE postoffice at Mammoth city has been abolished, and thus has the last vestige of that once thriving mining town passed away.

HEAVY fires are raging in the foreste near San Bernardino mountain, and extending over into Bear valley. A large amount of damage to timber is reported.

THE Carson *Appeal* says: "The trout fishers now find plenty of game in the deep pools of Carson. Since the water has begun to run low the fish have left the riffles and gone into the still pools."

THE Reno *Journal* says the asylum and the new railroad will be the means of dishursing over $100,000 at that place within the next three months.

BARON ADOLPHE DE ROTHSCHILD, brother of the partnere in the Parie house, has bequeathed to the Louvre his collection of art works, with $200,000 for their maintenance.

Our Agents.

OUR FRIENDS can do much in ald of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. F. OSBORNE—San Francisco.

A. LEONARD MEYER—Utah and Idaho Ter.
C. E. WETMORE—Alameda county.
J. M. WOLFE—California.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

THE State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half year ending this date, the Board of Directors of The German Savings and Loan Society has declared a dividend on Term Deposits at the rate of five and one-tenth (5 1-10) per cent per annum, and on ordinary Deposits at the rate of four and one-fourth (4¼) per cent. per annum, free from Federal Taxes, and payable on and after the 11th day July, 1881. By order.

GEO. LETTE, Secretary.

San Francisco, June 30, 1881.

Steep Hollow Gold Mining Company.—

Location of principal place of business, San Francisco, California. Location of works, Liberty Hill Mining District, Nevada County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 6) levied on the 21st day of June, 1881, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Cert.	No. shares.	Amt.
Jos. Clark	3	50	$75 00
E. A. Richardson, Trustee	25	100	150 00
E. A. Richardson, Trustee	26	100	150 00
E. A. Richardson, Trustee	27	50	75 00
E. E. Dewey, Trustee	50	500	750 00
J. W. Pew, Trustee	55	2250	3375 00

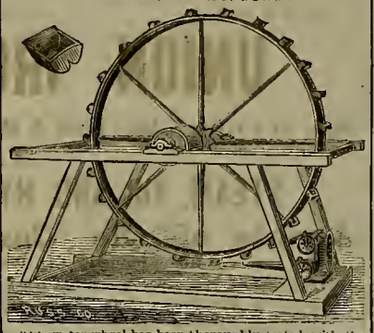
And in accordance with law, and an order of the Board of Directors, made on the 21st day of June, 1881, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the auction rooms of Jno. Middleton & Son, No. 116 Montgomery street, San Francisco, California, on Thursday, the 18th day of August, 1881, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. W. PEW, Secretary.

Office, 310 Pine street, room 15, San Francisco, Cal.

THE PELTON
WATER WHEEL.

(Patented, Oct. 26, 1880.)



The water wheel has been thoroughly tested with the Dynamometer, and utilizes 78% of the theoretical power; and underheads of water of 75 to 800 ft is guaranteed to give better satisfaction than any Turbine or other wheel ever offered to the public. The above per cent. is due to the peculiar shape of the buckets used. They do not reduce the water to a spray, but divide and deflect it outward and backward, in such a manner that a part of the impact and the whole reactionary force are utilized, without any part of the water coming in contact with the bucket following. Furthermore, the per cent. of efficiency remains constant through great variations in the amount of water used. These buckets can be taken off in transportation, and can be replaced by new ones when worn out by sand in the water; also can be applied to wooden wheels when desired.

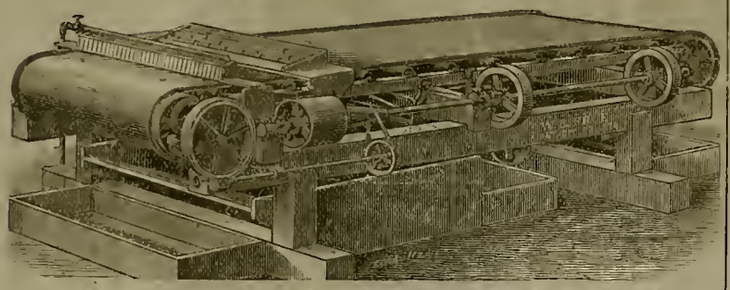
Hoisting and Pumping Machinery.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR.

Over 250 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and the concentrations are clean from the first working.

The wear and tear are merely nominal; the water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

ADAMS & CARTER, Agents. Room 7, No. 109 California Street, S. F.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

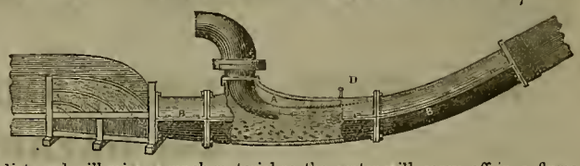
Send for Circular. EDWARD G. DENNISTON, PROPRIETOR.

Awarded First Premium at Every Fair of the Mechanics' Institute for the Last Twelve Years.

HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY.

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co., S. F.

Excelsior Blasting Powder,

—MANUFACTURED BY—

THE EXCELSIOR POWDER COMPANY.

—o—

This is no NEW PATENT NON-EXPLOSIVE SAFETY POWDER, but the GENUINE STANDARD ARTICLE, and as safe to use and handle as any Nitro-Glycerine Powder manufactured. The Fumes and Gases, common in other Nitro-Glycerine Powders, are almost destroyed, and do not leave the miner with headache or nausea. Among the numerous recent testimonials the following is but a fair sample, constantly received, attesting the superiority of EXCELSIOR POWDER.

AUBURN, Cal., May 26, 1881.—EXCELSIOR POWDER CO.: I send you, per Wells, Fargo & Co., a box containing samples of country rock through which I am running our tunnel on the Conrad Mine, and through which we have now run 425 feet, 225 feet of it having been done with EXCELSIOR POWDER. If any one can produce harder rock I would like to see it. I here say that I can do more execution with your No. 2 Powder in this rock than I can with any No. 1 Powder of any manufacture I have ever used, and I have used every kind now manufactured here, excepting "Tonite," and I have had 20 years' experience in blasting. Respectfully yours,

E. W. ROBERTS, Superintendent.

Give this Powder a trial and you will use no other. For Strength and freedom from noxious fumes, it has no equal. Address all orders to EXCELSIOR POWDER CO., No. 330 Pine Street, Rooms 53 and 54, Academy Building, San Francisco, Cal.

VOLUME XLIII Number 8

The Milling of Gold Quartz.

The following paper was recently read before the California State Geological Society, hy Melville Attwood, F. G. S., "On the Milling of Gold Quartz.—Amalgamation:"

When last I had the pleasure of addressing yon, the snhject was on the petrology, or jointed strnctnre of the rock masses of the Bodie mining district. This evening I wish to call your attention to a mnch more important snhject, namely the milling of "Gold Quartz." At the present time the mining commnnity of this State are nsing strennons efforts to make the working of low-grade ores a profitshle husiness, and if any snggestion of mine will in the least assist the matter I shall feel amply repaid.

I hope however, other miners more capahle than myself will communicate the resnlts of their experienco on this subject.

If we search tho records of past times, we shall find that a great deal has been done years ago, which might he applied with great advantage even at the present time, in proof of which examine the drawings and descriptions of them, which I have hrought for yonr inspection. The first or No. 1, (see engraving) I copied from Sir John Pettns' hook on the "Lsws of Metals, &c," pnhlished in 1683, nearly 200 years ago. You will see how much hetter it is calculated to wash gold allnvia than our modern rooker.

An explanation of the engraving, taken from the hook referred to, is as follows:

1. The man that worketh with the rattar.
2. The middle floor whereon that which goeth through the rattar doth fall.
3. The lower floor whereon that which cometh from the middle floor doth fall.
4. The plain receiver of that which falls npon hoth.
5. The person that stands on a hoard and ont of a wheelharrow throws the matter or oar, into the tunnel which guides it into the rattar.
6. The channel in which water doth rnn into the rattar.

"Then some of the gold washers nse npon their hearths the strong timode hlaok and rnsset woolen cloth, over which they do drive their works, hecause the woolen cloth is rough and hairy, so that the small and round grains of gold will remain, and not run forth (as it will from the timode), whereby the gold npon the hlaok cloth may apparently he known, though it be small and little. Others nse instead of the timode or hlack woolen cloths, linsy-woolsy (half linen and half woolen; wrought in the manner as the timodo is), npon which the gold doth stick hetter, and such cloths do last longer, hecanse of the linen that is among the woolen, which doth strengthen it; therefore it is hetter for this work."

For the concentration of sulphurets look at the drawing, No. 2 (see page 121), "Brunton's ore-dressing frame," which I rememher seeing in successfnl operation in the year 1847. The drawings I have copied, were pnhlished in the London *Mining Journal*, 1847. It is very similar to the Frne concentrator now heing so snccessfully introdnced at our different qnartz mills.

A is a piece of prepared oanvas, 30 ft. long, joined at the ends—thus forming an endless hand, with slips of wood fastened transversely on the inside, and making, when stretched on frame and rollers, a snrface of 12 ft. loug and 4 ft. wide, the inclination of whioh is altered to snit the material to he operated on hy the screws, *G G*. *B* is an inclined plane, divided into several channels, in connection with the trough, *C*, into which is placed the ore to he dressed, from which it is washed and distrihuted over the channel, *B*. *D* is a shoot, over which clear water runs; *E* a cistern, or receptacle, where the cleaned or dressed ore is deposited; and *F* another, into which the dirt and waste falls. By the action of the water-wheel, the endless helt is maóe to move oontinnously upwarda against the stream; and as the work is washed on the tahle overhead, *B*, where the atream is increased hy the clean water, which two streama oombined are snfficient to wash the waste over the end of frame into cistern, *F*, while the ore, hy its anperior gravity, resists the force of the stream and is carried npward, heing, while passing hetween the heads, *B* and *D*, snhject to the aotion of the stream of clean water. When the ore thus separated from the waste is carried np past the head, *D*, it is free from all action of water, and adheres to the canvas nntil it tonches the water in cistern, *E*, when it directly falls off, and is deposited in the hottom of the cistern, *E*. Thus, there is a continuons stream of material to he dressed passing over the inclined plane, *B* —a continuons steam of waste going over the end of frame into cistern, *F*—and a continuous stream of clean or dressed ore heing deposited

FIG. 1—MACHINE FOR WASHING GOLD ALLUVIA 200 YEARS AGO.

in cover, *E;* and it is fonnd that no other method yet adopted can either produce the same effect, hoth as regards the high produce of the cleaned ore or the impoverished state of the waste, in which psrticular point the great saving is—as, let the person attending it he ever so negligent, no ore is heing wasted, so long as the water-wheel is at work, while in the old method there is a great qnantity of ore which finds ita way to the tail of the frame through the negligence of the party using it.

The plan of a "trnnking hnddle," No. 3 (see page 121), or a machine for washing the alimea or tailings collected in dama or catch-pits, was an invention of my own, hy which, in 1842, I recovered many thousand ponnds worth of copper ore. It was puhlished in the London *Mining Journal* of that year, and models of it placed in the Mnseum of Practical Geology. It might ho nsed to advantage as a rapid means of treating the tailings that have aconmnlated at tho Comstock, Bodie, and other mining districts.

In this engraving, *A* represents the holes hy which water is admitted; *B*, knives to cut the tough slime and divide the stream of water; *C* is a drnm with wings to work the slime np well; *D*, grates; *E*, hesoms to sweep the grates; *F*, vanes to keep stirring np the slime as it psses into the trunks; *G*, trunks; *H*, stops to regnlate the water in the trnnks; *I*, a hox into which the hesoms sweep the small pieces of wood and stuff too large to psss through the grates.

Fig. 4 (page 121) is the modern rooker or cradle, which is shown simply that it may he compared with the ancient appliance shown in Fig. 1.

The principal ohject in my now addressiug yon, however, is to snggest and recommend the extracting of the

Gold from the Sulphurete

By amalgamation in *wooden barrels*, the same that has heen successfully employed at the St. John del Rey mine, Brazil, for nearly a half a century, in place of the chlorination process now so mnch nsed in this State. I feel assnred hy the former process more gold will he saved, and at a oonsiderahle less cost.

The St. John del Rey mine is owned hy an English Co., and has heen profitahly worked for npwsrds of 45 years. Last year, 1880, in their fiftieth annual report it appears they stamped 63,540 tons of veinstone, and state the cost of milling the same was 3s.11½d. per ton, ahout $1; and that the net profit for that year's workings wss $315,000.

The veinstone of the St. John del Rey mine is a mixture of magnetic, arsenical and common pyrites desseminated in a quartzose gangne, and is composed of ahont 40% of silica, and 60% of pyritic matter—the arsenicsl pyrites carrying the most gold. The smallest grain of gold is rarely seen hefore concentration.

Their Procese of Amalgamation

Is nearly perfect, hut the stamping and concentration very defective, the stamps doing hut little duty, only 1¼ tons per head during the 24 hours. Their plan of concentration heing principally what is called "straking," consisting of a numher of fixed inclined trays 30 ft. in length, and 18 ioches wide, with a fall of one inch to the foot, the trays are covered for the first 16 ft. with hullock's skins tanned with the hair on them, and in lengths of two ft. two inches; helow these are a series of hlankets or haize cloths of the same length. The deposit of sulphurets on the first three skins contains nearly all the gold, and amonnts to ahout 0.42 of a cuhic ft. per ton of veinstone. Stamped, it contains ahout 30 ounces of gold per ton, all of which with the exception of one ounce is in a free state—the ounce of gold heing mechanically mixed with the coarser grains of pyrites.

It is estimated that in stamping and straking, 10% of the total amount of the gold is carried off in suspension hy the water.

Their loss in amalgamation is comparatively trifling, as far as I can gather from their nnmerous reports, and will average less than 4%—the loss of mercury is 0.45 ounces per cuhic foot of sulphurets amalgamated. The apparatus employed for amalgamation of the sulphurets, consists of wooden barrels, four ft. in length, and two ft. five inches in diameter, having a capacity of 20 cubic ft. The charge of sulphurets for each harrel is one ton and a half *free from decomposition*, and 60 lbs. of mercury. There is also a sufficient amount of clean water at the same time introduced to give the slimes the necessary degree of fluidity to enahle the glohules of quicksilver formed to hecome properly incorporated, without allowing them to hecome sufficiently mobile to admit of the settling of the mercury and amalgam at the bottom. The harrels when charged are allowed to rotate from 20 to 30 hours, making 18 revolutions per minute in accordance with the state of the atmosphere.

The contents of the harrels are afterwards washed in an apparatus called a "ssxe," which is used to separate the gold amalgam from the refuse. In this country it might he perhaps hetter to employ separators the same as those used in the different pan mills.

In thcir report of 1880 the resnlts of their trials of

The Cometock Pan Syetem

Was anything hut satisfactory, indeed in the milling for gold that system appears to he too costly for low-grade ores, and not fit for the rich. It is hetter calculated for the treatment of veinstone which contains in the ton from five to ten onnces of silver, and that in a snitshle mineralized condition as chlorides etc.

The attempts to grind the sulphnrets when they contain upwards of 50% of pyritio matter, and to amalgamate the mechanically comhined gold enclosed in the particles of pyrites, at the same time and in the same pan, has not heen attended with success from the earliest attempts, some of which I witnessed in Brazil in 1832, which was then made in an apparatus heing a modification of the Hungarian howl. The St. John del Rey

Sulphurete When Ready for the Barrel

Contain ahont 95% of pyritic matter, and are redneed so fine that 90% of it will pass throngh a sieve having 100 holes to the linear inch.

What I have tried of the Californian sul-

[[CONTINUED ON PAGE 121.]

Geographical Society of the Pacific.

A meetiug of this society was held last week, Prof. Davidson (President) in the chair. Mr. Tb. E. Slevin, on behalf of tbe Executive Committee, reported tbat a hall had beeu rented, furnished and provided with all requirements necessary to carry out the object of the society; tbat a library of geographical works had been donated by members, and tbat the Government at Washington had furnished a large numher of charts and maps of tbe coasts, and the adjacent States and Territories. Many members had joiued tbe society since the last meeting, and a number of persons bad signified their intention to become members.

Reports of Officers.

Tbe Secretary reported that 106 gentlemen had subscribed their names up to date. Of these, 100 were regular members, whose initiation fees amounted to $1,000, the dues to the first quarter to $300, and six life members, $600, making a total of $1,900.

The donations to the society are valued at $500, and it is expected that this valuation will, witbiu the next three months, bo very largely iucreased, as many geographers and explorers are taking a great interest in its success.

Tbe Treasurer reported having expended $870.20 for rent, furniture, stationary, etc. Tbe hills had been audited and paid.

The President stated that tbe Constitution and By-laws had been framed with great care on the basis of the American Geographical Society of New York, the California Academy of Sciences and otber societies of this city.

Tbe Secretary having read the Conetitution and By-laws, Mr. Wm. Lane Booker proposed that tbey be adopted. Tbe motion was seconded by Mr. F. Barton and carried unanimously.

Tbe President expressed his satisfaction that the Society was now fairly launched, and he had no doubt it would prove of great service, not only to the inhabitants of California, to tbe travelers and explorers of tbe Pacific coast who make San Francisco their starting-point, hut also to the navigators of the Pacific ocean. Many of the captains of tbe whaling vessels who had visited tbe Arctic regions would be able to give from time to time much valuable geographical knowledge to this society, and he tbought it would he advisable to make it generally known, that tbey may regard the society's rooms as a rendezvous for information. The society would bave it in its power to render good service to many of the scientific societies abroad, and these societies would reciprocate the services rendered. Tbe Academy of Scieuces had bitherto necessarily gathered all tbe geographical knowledge that had been brought to San Francisco, hut uow tbat the Geograpbical Society had been established they might hope to gleau from all parts of the coast more particularly every item of new information that could be given. For bie part be should make a point of doing all that he could to furtber its objects. He was about to visit the interior for some monthe, and he would contribute all that be could iu a geographical point of view. There was a very large

Field for Geographical Exploration

In the new region acquired by the United States from Ruesia. An immense belt of timber of extraordinary growth throughout tbe Arcbipelago Alexander, was there to be found, wbich, when the forests of tbe more southern regions are exhausted, will prove of inestimable valne.

Tbo President also alluded to the imperfect surveys of the Alaska coast and to the fact that private companies, such as the Hudson Bay company, possessed much valuable information of localitiee which were unknown to the general public and to the Government.

Tbe question as to whetber Plover island was a part of Wrangel Land or an island, was brought up and fully discussed, the President referring to a paper wbich he had presented to this society with a chart.

Mr. Wm. Lane Booker stated that be had just received a letter from Captain Markham, who gave it as bis opinion tbat no fears need he entertained as to the safety of tbe crew of tbe *Jeannette*, for although the *Jeannette* might be crushed iu the ice, they had ample means of protecting themselves and of effecting communication with the inhabitants.

Prof. Davidson remarked that in a conversation with Lieutenant Schwatka, that gentleman had expressed a similar opinon.

The question as to whether or not water could he found on Socorro island, was mooted hy Mr. Booker, who etated that a vessel had touched there and a man was left ashore. An English war-ship had stopped at the island iu order to make a scarch for this man, hut no trace of him could he found, nor had any water been discovered. It was his own impression tbat water did not exist there—recalling the circumstauces of the loss of the *Mathilde*, and the faot tbattwo vessels, the *Freda* and *Lancashire Witch*, sailed from this port in search of the shipwrecked crew. He thought this would he an interesting subject for inquiry.

The Sacramento *Bee* says most of tbe hydraulic miuee are owned hy foreign companiea. The Nevada *Transcript's* statement is falee. Out of the large numher in this county, only one of them ie owned hy a "foreign company," aud that company would have been hetter off, financially, if they had never eeeu a hydraulic claim.

The Scale Insects at San Jose.

Tbe outlook for conquest on the side of the fruit growers against the pests which endanger their industry, becomes brighter when we remember the number of earnest men who are now working as amateur entomologists and unyielding insect-fighters in the different parts of tbe State. A forcible illnstration of this fact comes to us tbis week in tbe ehape of a report made to the Santa Clara Horticultural and Viticultural society, by S. F. Cbapin and D. C. Vestal, two fruit growers of the county. This report was submitted at the last meeting of the society and it fills nearly four long columns in tbe San Jose daily newspapers. There is given a long record of observations on the insect wbich is an undescribed species of *Aspidiotus*, locally known as the "small, round, hlack scale." It aleo describes the results of 22 experiments iu tbe application of different materials in different ways, showing that the committee bas used due diligence in the aggressive departments of its work. We have not space for the introductory notes on tbe insect nor for the enumeration of tbe experimente aiming to destroy it, hut the most practical portion of the report, which is a deduction from all local experience and experiments, will he found valuable everywhere that scale insects have come, and we shall give a etatement of its essential parts.

As the female scale insect has no wings, sbe can, of course, only he spread about by becoming attached to sometbing hy whicb she is carried to different localities; and hy crawling during the short period after hatcbing, before becoming fixed for life. Birds will carry tbem most frequently about an orcbard; and it is tbought tbat one sonrce of danger is little regarded, viz.: carrying tbem about on one's clothing hy brusbing against infested trees. The system of return hoxes aud packagee of any cbaracter, is known to be pernicious, and a fruitful source of the spread of all kinds of noxious insects, whiob either as insects, eggs or larvæ are fastened to tbem and taken into the orchard to he developed in due time. If boxee or packages are returned they should ho dieinfected as soon as received by dipping in boiling water to which is added not less than one pound of potasb to 25 gallons of the water used. Trees procured for transplanting should be washed as eoon as received, witb a strong potash wasb, with not less tban one pound concentrated lye, to tbree gallons of water.

Thorough and constant cultivation of an orcbard should he kept up; and diligent watchfulness of every tree hy the owner himeelf exercised, so that no scale insect sball escape obeervation, and when found the proper remedy should be iustantly applied. All orcbards, even tbough showing no scale, should be wasbed with concentrated lye of the strength of 1 lb. to 3 gallous of water, as this strength will keep treee healthy and free from moss and filth. Where infested with scale insects, the strength of 1 lb. of lye to 1 gallon of water (or not less than 1 lb. to 1½ gallons water) shonld be used. This strength will destroy all scale, and also will completely destroy the eggs and larvæ of the red spider; as found from experiments made, any less strength will not destroy the eggs of tbis mite. Lye should be applied in a spray by the use of a garden syringe, or where large orcbards are treated, the most economical meane is to uee a large harrel or tank placed upon a wagon or eled and drawn through tbe orchard, and the solutiou thrown upon the tree by a force pump, throngb 30 or 40 ft. of hose, to wbich is attached a nozzle baving for ite opening a simple straigbt slit, very narrow in width and one-sixteentb to one-eighth of an inch long. Great care should be observed to cover all portions of tbe tree, as upon its thorongh application depends its success. Care should also be taken to protect the hody from its effects, as it hurns the ekin. Tbe lye is best broken up and dissolved in a small quantity of boiliug water and then the required strengtb obtained hy adding cold watcr. Strong lye should only be used when the tree is dormant—as in any effectual etrength it will burn the foliage. One hundred large trees can be washed thoroughly.

Tbe investigatione of the committee show that where crude petroleum has heen used it kills the tree *if the sap is moving;* where the trce ie *entirely dormant* it may he used perhape without destroying the tree. Crude petrolenm is too heavy and ite uee is not recommended. Kerocene (refined coal oil) in no instance has killed the tree, hut bas destroyed the scale and relieved the tree of its presence, thue enabling it to recover. While not fertilizing the tree, it ie effeotual as a remedy and can be applied at any season of the year if of a high grade (150 test). The best time however to apply it is when the tree ie dormant, and invariably used when the tree is dry; as it will he of no avail if applied to a wet eurface. It should be applied in as fine a spray as possihle, and ae little used as will once cover the tree, taking care that the entire tree is sprayed. In this way high-grade kerosene is recommended. A lower grade (100 test) may be used *only when the tree is dormant;* the hest time for application is in the autumn after the leavee bave fallen. Concentrated lye hae proved itself, where used of sufficient strength, to he thoroughly reliahle and effectual, and has the great property of fertilizing the tree and eoil, ae potash ie one of the natural conetituente of both, and is required for the health of the trce. Its use is therefore recommended—60 lbs. of the concentrated lye of tbe American Lye Co. ie equivalent to 100 lbs. of Commercial potash.

Where trees are very had it is recommended to firet apply kerosene in the autumn and then by the time tbe sap starts late in winter apply lye 1 lb. to 2½ gallons water. For summer washes (other than higb-grade kerosene) to be best applied about the first of June. The following are recommended:

Whale oil, soap oil and sulphur. Mixtures, 1 lb. to 1 gallon water; or, soft soap 1 lb., sulphur 1 lb., tobacco 1 lb., added to three gallons water, are all that can be recommended.

Tbe different proposed means of destroying the ecale, hy boring tbe trunk of the tree and putting in the hole preparations of various sorts have been proven ineffectual, as the committee has observed tbat where tried no effect at all has been produced and tbe trees are etill alive with scale. So far as they can determiue no remedy can be effectual, which does not directl reach the scale, and through its penetrating power destroy the ineect itself. The committee's experiments show that young orcharde may be kept free from ecale by constant care, and where invaded, tbe insect at once destroyed. Old orcharde infested very seriously may become cleared and the trees giveu new life and vigor. It is the firm conviction of tbe committee that could nnited action he secured, the pest could speedily be destroyed and stamped out of existence.

Pacific Coast Harbor Improvements.

Tbe annual report of Col. Mendell, of the United States Board of Engineers for the Pacific coast, having charge of the river and harbor improvements in California, has been sent on to Washington. The following is the substance of his report on tbe most important works in California:

Oakland Harbor Improvemente.

At the beginning of the past fiscal year, July 1st, 1880, the operations on this harbor had been suspended for three years, on account of tbe restrictione of tbe law requiring that a title shonld be acqnired by the United States before work could he resumed. In June, 1880, Attorney-General Devens gave an opinion tbat tbe United States already had fnll rights, and in accordance with bis opinion tbe work was resumed iu tbe fall of tho same year. During tbe tbree years' snspension of work on tbis barbor, tbe jetties bad settled considerably, and in some placee falling below tbe level of low water. The effect of this was a reduction iu tbe depth of the cbannel from 10 to 8½ ft., for a distance of several hundred feet. Up to tbe 30th of last June tbe dredging was not sufficiently advanced to restore the original depth of 10 ft. During the past year tbe operations were continued for carrying out the original plan of improvement, wbich consists of the extension of rubble stone jetties from tbe Oakland shore to deep water in San Francisco bay. The north wall has heen raieed to high-water mark for a distance of 5,700 ft., and the south wall has been raised over a distance of 930 ft. to tbe bigbt of five ft. above low water mark. Tbe work of dredging was begun last April, and still continues. Wben the contracts now in force for dredging are carried out, it is the intention of Col. Mendell to use all the available fnnds to continue the dredging, and the operations of the year will be cnnfined to the execution of tbie work. The future operatious will be the prosecution of the excavation of a tidal basin to connect tbe San Antonio and tbe San Leandro estuaries. Col. Mendell thinks the present year will probably pnt the jetties in condition so as not to need any attention for eome yeare to come. Tbe channel between the jettiee will require gradual enlargement, and the same is true of tbat portion of the cbannel lying in front of Oakland. It does not, however, he says, seem probable that tbe enlargement of the channels will be continued for several years. About $55,000 was expended during the past year, leaving about $219,000 available from the past appropriations for future operations. Col. Mendell thinks tbat $300,000 can be profitahly expended during the year ending Jnne 30, 1883.

Wilmington Harbor Improvements

The principal operations of the past year bave consisted iu dredging for the purpose of widening the channel through the reef, whicb lies west of Deadman's islands. The depth of the channel continues to improve, and there ie now a good channel over ten ft. deep at low water. Colonel Mendell saye it ie quite possihle to increase the depth of this channel to 15 or 16 ft. at low water by the excavation of the reef and hy the extension of the jetties. A careful estimate ebowe that the probahle cost of tbese operations will probahly he ahout $292,000, which snm conld he advantageously expended in two years, if the appropriatione were made. Col. Mendell in his report eays that the increase of the population in Southern California and the extension of the railroads in Arizona and New Mexico, have given increased importance to Wilmington harbor, and tbere eeems to be more reason uow for a harhor 15 ft. deep than there was for 10 ft. deep at the time the improvements were commenced. The operations for the coming year will he covered by tbe contracts now in force. They consist mainly in placing the etone on the jettiee. About $39,000 wae expended during the past year, and about $29,000 remain from the past appropriation, which ie availahle for the coming year'e work, and which eum ie not sufficient to do all that is desirable. Mendell thinks that $650,000 can he profitably expended during the two years ending June 30, 1883.

Sacramento River Improvements.

Tbe operations on tbe improvement of the Sacramento river for tbc past year were confined to removing and destroying snage from the upper river. As a result of these operations, tbe river was put in a better condition last summer tban it bad heen for years, and the movement of an unusnally large wheat crop was greatly facilitated. Tbe operations of the coming year will be principally tbe employment of a new snag-boat during the greater part of the year, if tbe etage of the water permits, in removing enage and cleaning tbe channel. No exact estimate can be made of the numher of obstructione likely to he met, but it is thought tbat a year'e work of the snag-boat will be necessary to put the channel in good conditiou. When this is once done, the yearly accumulations will require removal. In addition to this work, provision for better depth in tbe ehoal places will have to he met. Tbe improvements projected for the lower river remain yet in sheyance, the demands for the upper river having up to this time left notbiug available for otber purposes. The Six-mile Bar, above Sacramento, the report says, in all probability, will require improvement in tbe coming year, aud will necessitate an expenditure of $12,000. During the last year $65,880 were expended on the river, leaving $50,500 of the past appropriatione available on July 1, 1881. The report states that $100,000 can be profitably expended on work during the fiscal year ending June 30, 1883.

San Joaquin Improvements.

The operations on the improvements of tbe San Joaquiu river last year were confined to the dredging of tbe channel at different pointe on the river. Tbc work being either not begun or uufinished at the close of the year, the prosecution of tbis dredging will constitute the operations for the coming year. The report states that no survey of the San Joaquin river as a wbole bas yet heen made, and for that reaeon no estimate of the permanent improvements has been possible. It recommends the survey of tbo river from Tulare lake to the moutb. Only $8,000 was expended on this work last year. Fifty thousand dollars was available on July 1, 1881, from tbe past appropriations, and $50,000 is the amount recommended that can be profitably expended during the year ending June 30, 1883. The work of improving

The Humboldt Bay and Harbor

Has not yet begun. At tbe close of last year, the appropriation of $40,000 by the act of Marcb, 1881, was first made for tbe Humboldt bay and harbor.

It is proposed to expend, during tbe coming year, three-fourtbs of this amount in dredging, mainly in front of Eureka. It is estimated tbat over $95,000 will be required for tbe completion of the projected work, and that $50,000 can be profitably expended during tbe year ending June 30, 1883.

Garfield District.

A New Mining Dietrict in Nevada.

A correspondent of tbe *True Fissure*, writing from the above-named district, says: Garfield District is situated on the south side of the Belleville and Walker Lake road, about midway between the lake and New Boston. Our district, as yon are aware, is young, hut we think it none the worse for that. There are about fourteeu very promising locations made at tbis writing. Tbc formation of the district is slate and porphyry, with some lime. Tbe veins are generally of the contact order, the two first formations forming the walle. Messrs. Johl and McDonald are working a number of their locations, and will continue to develop them as rapidly as convenient. They have quite a number of tons of ore on the dump that will average from $600 to $700 per ton. The deepest shaft in the district is ou the Fairmount No. 2 mine, heing about 40 ft. in depth. The vein has improved in size, as well as in quality of the ore, from ten ft. dowu. The ore is black metal and cbloride. The veins are in size from three to ten ft. in width, tbe smaller veins being much richer than tbe larger ones. They are also working the Fairmount No. 1 and the Lottie mines, both of wbich are looking very well and producing oro. They have two other claims tbat look well on tbe surface, hut are not working them as yet.

Water and timher are scarce articlee, the nearest water heing at New Boston or Walker Lake, about fifteen miles from either place. I think, however, a good supply conld he obtained within four miles hy sinking a well. There is plenty of scrubby cedar for all preeent purposee. There are some twelve miners in the camp, and all are at work. A good ebow preeente itself for prospecting if one hae animals to pack or haul water. Grass ie plenty in the mountaine, and the animals will do well if watered.

Col. Davies, eaye the Marysville *Appeal* of July 30tb, leaves for California to-day to take part in the May Lnndy cnit, which will he opened iu the Snperior Court of Mono county on Monday next. At Reno he will he joined by Gen. Clarke who is also in the caee. The cuit is brought by J. M. Miller *et al.*, to recover a half interest in the May Lundy, Monitor, Lake View and Bryant mines, situated in Homer district. George W. Butterford *et al.*, are the defendante. The suit involves $10,000,000.

MECHANICAL PROGRESS.

Progress in Iron Casting.

But little change has been made in the *methods* of simple iron castings during the last half century, but the *practice* has been wonderfully improved during that time. The progress which has thus been made, which is great, has been due to superior materials for molding, better fuel, better quality of iron and superior skill in practice. The result has been such as to almost elevate iron founding to the plane of the fine arts, and various art works in bronze, silver and brass are now reproduced in iron with most striking art effect. This improvement was first noticed in the rival efforts of stove manufacturers, many of whose castings are now made almost as thin and smooth and sharp in outline as can be produced by the most skillful workers in bronze. Antique swords, ornamented helmets, Japanese bronze trays, with foliage ornamentation, and many other ancient works of art are now reproduced in great number.

According to the *Industrial World*, the best American iron castings are fully one-third stronger than the best English. The cause for this favorable difference between the American and British castings is said to lie in the quality of the iron employed in their construction. The result of this difference in quality is most plainly shown in the superior lightness and finish of our manufactures in iron. We do not mean to say that there never have been any castings in England as fine as those we produce here, but we freely assert that the majority of castings that there pass for the best are inferior in quality to those made here. We might also add that castings made at the lake cities of Cleveland, Chicago, Racine and Milwaukee, as a general thing, are superior on many accounts to those made in the Eastern States. This is the testimony of workers in iron. They say that the best grades of Eastern castings are more or less porous or flaky, and that numerous little holes or specks are discoverable, which impair their appearance as well as their strength. The Western castings—and we only refer to the highest grades—have a fine, close structure, and are soft and easy to work. In fact, they can be milled nearly as easily, and without annealing, as can the Eastern castings after annealing. * * *

But while saying so much for the West we are constrained to make the admission that in point of finish the Eastern makers have some advantage over most of our Western foundries. The Eastern molders have a faculty of turning out castings with sharp, well defined surfaces, and their work is truer and more uniform than much of our Western work. Then many of our Western foundries have yet to learn the art of pickling which is so desirable in making many descriptions of castings. But we belive that our Western foundries are making rapid progress in improving their work, and we predict that the time is not distant when the West will compete with East in finish and style of work, as they already do in the quality of their productions. We, in fact, have a few foundries already in the West that are formidable competitors of the Eastern makers, and it is fair to suppose that we shall have many more.

What Becomes of Condemned Boilers.

If the secrets which are locked in the breasts of the junk dealers of Philadelphia could be revealed, a startling tale might be told. In different parts of the city there are sidewalks and yards which are occupied from January to December with boilers which have been placed under the han. As fast as one disappears another takes its place. Sometimes thirty, forty, or even fifty, may be counted in a single yard. A few months later another lot have taken their places. Where have they gone? Some up through the State, some to Jersey, some to Maryland; but the majority might be found in use right in Philadelphia. It is a notorious fact, freely admitted by every man in the junk trade, that a boiler may be condemned, perhaps purely on account of a little capriciousness on the part of the inspector, removed to a junk shop, painted up, perhaps a soft patch or two put on some place, then resold, built in position, and passed at a pressure which, if allowed in the first place, would have saved the original owner the necessity of replacing it. As a matter of fact, there is absolutely no method by which an inspector can identify a boiler a second time. Very few condemned boilers are broken up for scrap. When the condition of one is so utterly bad that even a junk man is afraid to recommend it to a city user, he generally finds no difficulty in finding a purchaser in some other part. Old boilers which would not pass muster at any pressure within city jurisdiction are regularly shipped across to Jersey, down to Maryland, or up the State.—*Philadelphia Record.*

AN INGENIOUS DEVICE.—The experiment of running a locomotive without brakes has just been successfully tried by the Delaware, Lackawanna and Western Railroad Company. The locomotive is of ordinary pattern, but has an extra pipe leading from the boiler to the steam chest, by which power can be applied against the piston, checking the engine and enabling the engine to reverse without "hauling over."

Brick Foundations for Machinery.

Experiments and observations concerning the strength and utility of brick foundations for machinery have been summarized by the age of industry. Trautwine is quoted as saying that a rather soft brick will crush under a weight of 450 to 600 lbs. per square inch, or about 30 to 40 tons per square foot, while a first-rate machine-pressed brick will require from 300 to 400 tons per square foot. This last is about the crushing limit of the best sandstone—two-thirds as much as the best granites or roofing slates. But masses of brick-work, he notes, will crush under much smaller loads than single bricks. In some English experiments, referred to by this author, small cubical masses only nine inches on each edge, laid in cement, crushed under 27 to 40 tons per square foot. Others with piers nine inches square and two ft. four inches high, in cement, only two days after being built, required 44 to 62 tons per square foot to crush them. Another, of pressed brick, in best Portland cement, is said to have withstood 202 tons per square foot, and with common lime mortar only one-fourth as much.

The same authority, however, is careful to add the statement that cracking and splitting usually commence under about one-half the crushing loads. To be safe, he recommends that the loads should not exceed one-eighth or one-tenth of the crushing load; and so also with stone. Moreover, he notes these experiments were made with low masses, but the strength decreases as the proportion of the hight to the thickness increases. He cites the following example: The pressure of a brick shot-tower in Baltimore, 246 ft. high, is estimated at six-and-a-half tons per square foot; and in a brick chimney at Glasgow, Scotland, 468 ft. high, at nine tons.

Prof. Rankin calculates that in heavy gales this pressure is increased to fifteen tons on the leeward side. The walls of both are, of course, much thicker at the bottom than at the top. With walls 100 ft. high, of uniform thickness, the pressure at the base would be five-and-four-tenths tons per square foot. He prudently concludes that with our present imperfect knowledge on this subject, it cannot be considered safe to expose even first-class pressed brickwork, in cement, to more than twelve or fifteen tons per square foot, and good hand-molded bricks to more than two-thirds as much.

Unfinished Tools.

Some time ago the writer was asked, by letter, why our machine tools are not sent ready to operate, barring the inevitable setting-up, leveling, hanging counters, and adjusting belts. Since the reception of the letter he has made inquiries of builders of tools, and so far has failed to get a satisfactory reply. In several instances it is a "*Cosas d'Espana*," an old custom, that should not be changed because it *is* a custom. When in Spain the traveler asks, "why is this thus?" he is met by the reply it is a custom of Spain. In other replies, the writer was informed that the operators of the new tools preferred to put their tools into shape to suit their own demands.

There appears to the operative and observant mechanic no special demand for unfinished tools, especially now, when there is such a demand for operative machinery. When a man buys a lathe, for instance, locates it, adjusts the counter shaft, and puts on the belt, he ought to have a tool ready for work. But, instead of that, he finds both centers lacking a point. They must be turned to gauge before a stud or shaft can be suspended between centers and worked. If there is any reasonable reason why the centers of a lathe are not ready for use when the lathe is placed *in situ*, the writer has not yet found it.

In most shops where the lathe is built, the test of agreement between the axes of the spindles and the ways of the lathe is determined by very severe tests—the centers of head-stock and tail-stock are proved by trial and determinate shafts, that fit alternately into one and the other center holes of the respective spindles. This trial not only determines the agreement of the two spindles, but also determines the agreement of the centers of each spindle, with the ways that guide the carriage that carries the cutting tool. It is evident, therefore (if the entire work has been properly done), that the centers of the lathe might as well be finished to the proper angle of 60° as to allow the purchaser the luxury of reducing them from a cylindrical to a cone-like form. It seems that there is room for improvement in this old-time practice.—*Boston Journal of Commerce.*

SINGULAR PROPERTY IN STEEL.—It is well known that a steel that is very flexible when cold breaks at the blue annealing temperature. It has generally been considered that the purer the iron is the less subject it becomes to this defect; but the workmen of the Ural Mountains, who use iron of remarkable purity, have often observed the same fact. Mr. Adameon has found that the metal becomes powdery at a temperature between 260° and 370° C. (500° and 698° Fah.) or the temperature at which willow twigs take fire. This phenomenon seems to explain a large number of accidents, as, for example, the breaking of tires under the action of brakes and the fraction of riveted molds and of machine arbors which become heated by friction.—*Ann. du Gen. Civ.*

SCIENTIFIC PROGRESS.

The Comet—Scientific Observations.

When the comet, which has just now passed out of sight in the northern heavens, first made its appearance, much confidence was felt that so large and conspicuous an object would afford an opportunity of adding much to our knowledge of those wandering bodies, by applying to it the new means of research, which have recently been devised in improvements in photography and in the use of the spectroscope. It was hoped that by the united action of these two devices many peculiarities might be obtained, invisible to the eye by any of the ordinary aids hitherto employed. But, owing to various causes, the result has not been very satisfactory.

Prof. Henry Draper, of New York, who has of late made stellar spectroscopy a specialty, and who has achieved so much success in this direction, that, in his recent photographs of the nebula of Orion, he has depicted details so minute as to equal in faintness stars of the 14.7 magnitude, has made persistent efforts to secure the best possible photographs of the comet's spectrum. His efforts were much impeded by unfavorable weather; but he has nevertheless succeeded in accomplishing something.

On an exposure of 162 minutes, the tail of the comet impressed itself to the length of nearly 10°—fully as long as it was visible to the sharpest unaided eye.

Three photographs of the spectrum of the nucleus under exposures of 180, 196 and 228 minutes were also obtained. It will require some considerable time before the results and discussion of these photographs can be fully determined. But enough has already been ascertained to lead to the conclusion that a large proportion of the light from the tail is reflected light, and that carbon constitutes an important element in the constitution of the nucleus. Other elements are also undoubtedly present.

The observations by Professor C. A. Young at Princeton were made under a very tantalizing state of weather, and, with only one exception, none of them exceeded sixty continuous minutes. Professor Young appears to have paid particular attention to a study of the jets which issued from the nucleus, the spectrum of which, when isolated—a very difficult thing to attain—was found to be continuous, indicating that the body under examination is an incandescent solid, although it may be a liquid or gas under a high degree of compression. The spectrum of the tail was also continuous, but overlaid by a banded spectrum, and corresponded to the spectrum of the coma—the bands indicating the presence of gases in a condition of great heat and tenuity.

Mr. William Harkness, of the Naval Observatory at Washington, examined the comet for polarization with very unsatisfactory results. The same observer remarks that notwithstanding the brightness of the nucleus, it gave a spectrum very ill-defined and difficult to measure. Mr. Harkness also remarks, in his report, that it is a matter of interest to note that on or about the 20th of June, two or three days before the comet became visible, the earth must have been in the immediate vicinity of the comet's tail; but his calculations have not yet been determined with sufficient accuracy to enable him to state definitely as to whether our orb actually passed through the tail, as it did on a similar occasion some thirty years ago.

Professors Wilson and Stone, of the Cincinnati Observatory, have announced that on the evening of July 8th the comet was seen to divide into two bodies, as Biela's comet did some years ago, the new and smaller comet appearing directly over the old one, but invisible to the naked eye. Two days after, on the 10th of July, Professor Hall, of the Washington Observatory, examined the comet with the large 26-inch refractor, and Professor Eastman at the same time using the 9-inch instrument, but neither of those gentlemen were able to see any indication of the reported division of the nucleus.

In this connection it may be well to note, as a possible explanation of the above, some observations made by an English astronomer June 29th, and reported in *Nature* of July 7th. It appears from the report, as above, that on June 29th the comet passed over a star of the eighth magnitude. We quote: "Definition very good and tranquil. As the star became involved in the jet it gradually increased in size, and, when seen through the brightest part of the jet traversed, resembled an ill-defined planetary disk about 3″ in diameter. At this moment the comet seemed to have *two* nuclei similar in aspect and brightness."

If a similar phenomena happened at the moment the Cincinnati astronomers were observing, they might possibly have been led into the error of a supposed division of the nucleus.

DECOMPOSITION OF NITRATES BY DECOMPOSITION IN THE DARK.—In plants which grow in the dark, although there is a regular organization and development of stalks, roots and appendages, there is a persistent elimination of a portion of the material which was contained in the seed. The tissue of the organs which are developed under a shelter from light is firm and strongly impregnated with a liquid which has a sensibly acid reaction. The cotyledons are, therefore, provided with the principles which are necessary for the life of the embryo; but nocturnal vegetation is unable to fix the carbon of the carbonic acid which is in the air. Boussingault has experimented in order to find whether this impotence extends to the fertilizing substances, which the roots commonly draw from the soil; if, for example, nitrogenous compounds, such as the nitrates and the ammoniacal salts, are assimilated. He immediately found that if a measured quantity of these salts is added to a sterile soil, a considerable portion disappears entirely, and only a part of the quantity is found in the growth. He therefore concludes that a soil which had been rendered entirely sterile contains traces of organic substances after vegetation in the dark. These substances are probably due to an excretion from the root, which exercises a destructive action upon the acid of the nitrates that were added to the soil.—*Ann. de Chim. et de Phys.*

SCIENCE IN CHINA.—The interest which the Chinese are taking in modern science and culture is not confined to the fact that they are sending great numbers of their young men to this and other countries for a liberal education, for they are also establishing schools of science and literature in their own midst, modeled after those of foreign nations and partly under the conduct of foreigners. They are not only apt as scholars—as imitators—but they are also beginning to strike out as original thinkers. As a case in point, a Chinese physicist, as reported in *Nature*, has recently asserted that "the law, which is commonly accepted, and which states that the octave of any note may be produced by doubling the length of a musical cord or tube, is strictly true only for cords. He says that experiments with tubes of different lengths and diameters have led him to the conclusion that the ratio of length is as 4 to 9, instead of 1 to 2." Several English and American scientific treatises have already been translated and published in the Chinese language, and it is probable that the time is not far distant when we may find valuable original publications in the same language.

ELECTRIFIED CLOTH.—In a wax-cloth manufactory at Griesheim, near Frankfort, the finished pieces of wax-cloth are hung up to dry in an artificially-heated room, being supported in successive folds on wooden bars placed across near the roof, and the lower parts being about a yard above the floor. The air is kept about a day at the temperature of 40° to 60° C. by means of the furnace gasses passing through earthenware pipes in the ground, but also and especially, an air-current heated by these. On opening the place, (the heat having been shut off for a short interval), the wax-cloth is found strongly electric. The boys go under to have their hair set on end, and a distinct shock is received on touching the cloth, more or less strong according to the size of the piece. The explanation, as Herr Krebs says, is doubtless to be sought in friction by the hot air on the wax-cloth in its rapid passage through the room. This is the more probable, since it has been noticed by the work-people that the electric shocks are more violent when the drying occurs in calm weather, which favors the passage of the air-current through the room.—*Ex.*

INVERSE ELECTRO-MOTIVE FORCE.—LeRoux has published a simple process for showing an inverse electro-motive force in the voltaic arc. It consists in extinguishing the arc by opening the circuit and immediately re-establishing, by hand, the communication between the two carbons through a galvanometer. This shows the existence of a current going from the negative to the positive pole between the heated carbon points, and in the contrary direction in the galvanometer. Hence arises the difficulty of illuminating two or more arcs in a continuous current, since it is necessary to overcome the same inverse force for each arc. Magneto-electric machines, with alternating currents, profit by the existence of this inverse current, and this is one source of their great advantage over ordinary batteries.—*Comptes Rendus.*

DISTILLING ALCOHOL BY ICE.—Raoul Pictet, of Geneva, so well known for his discoveries relating to the liquefaction of gases, announces the discovery of a method of distilling alcohol by ice. Two kilograms of ice are needed for the production of a liter of alcohol; that is, for the distillation of 110 gallons of alcohol, a little less than a ton of ice will be required. The cost of production will include only coal for working the steam engine which drives the air-pump, and the sulphuric acid, the evaporation of which produces the ice. M. Pictet declares that this will notably diminish the expense of distillation, and suggests that the excise on alcohol should be proportionally increased.

ABSORPTION OF OXYGEN IN COAL MINES.—The Belgian Academy of Sciences has received a report on the researches made by M. Fabre regarding the diseases to which coal miners are especially liable. He finds that, as coal absorbs rapidly up to 100 times its own volume of oxygen, the air which the miner have to breathe is deprived of oxygen to a hurtful degree; the atmosphere of a mine is also further vitiated by the gaseous carbon compounds given off by the slow combustion of the coal. M. Fabre concludes that a supply of air is more essential than that of light, and even the best ventilated mines require better ventilation.

IT is said that an addition of 3% to 5% of glycerine is sufficient to keep indigo extract dry for years, without having the least influence on the brightness of the product.

The Mining Share Market.

Mining stocks have been comparatively lively during the week, though nothing startling has occurred on the Comstock. The Virginia *Chronicle*, commenting on the statement that the value of Comstock shares has shrunk in six years $264,402,704, says:

There are many who will take a pessimistic view of the above startling summary and endeavor to wrest the figures into condemnation of mining and pursuit of wealth as stamped in evanescent colors on the certificates of stock values, which have exhibited such remarkable powers of expansion and equally vigorous force of contraction. Such a view may be a grateful one to some, and may open a vast chilling perspective dear to the cantions Bostonian or frigid speculator of the Quaker City, but to the average Utopian of this immediate section it will have none but a revivifying effect. Hope springs eternal in the Comstock breast, and the shrinkage in stocks of some $264,000,000 impresses the hopeful denizen of Mt. Davidson merely as an immense vacuum in values which may yet be filled up by active inflation of the very stocks which have so seriously collapsed. And there is this consoling thought, that if in the near future prices do not reach such extravagant figures as in the past, they are at least likely to have more lasting values, based on the solid backing of ore, which promises soon to be shown up.

There are once more rumors of a change in the control of Sutro tunnel. The Virginia *Enterprise* says: There was yesterday a rumor (and pretty well founded) that Mr. Mackay has either secured control of the Sutro tunnel or made arrangement by which he and some of the large holders will work harmoniously together.

Sutro tunnel stock is gaining strength in New York. The company will at no distant day commence work on some of the veins through which they have passed. With very little trouble they will he able to find a vast deal of excellent ore.

PARK CITY, Utah, is probably the most active mining camp between Tombstone and Leadville. In the past year it has nearly doubled in size and population and still continues to grow. The Ontario is pouring forth a steady stream of bullion. There are other mines in the place which many regard as fully as promising as the Ontario. The Ontario has produced $8,750,000. The hills surrounding the place may he said to he merely scratched for mineral.

New Dry Ore Washer.

A machine called the "Enreka Concentrator and Disintegrator" for dry placers, sand and cement, ie to he seen in the upper story of No. 10 Stevenson St., where we examined it this week. This ie the latest and most simple of the many "dry washere," end ie the result of a nnmher of years experience with this class of machines. It weighe about 250 pounds, and ie 3x4x4 in size.

The ore table is stationary, not having any side or end shake of any kind. Under it, however, is a peculiar douhle acting hellows which forces a pulsating hlast of air up through the drilling or light canvas, which, on top of a wire frame, forms the ore table. Riffles are formed on this inclined table to catch the heavier particles. A peculiar and valuahle feature of the appliance is an apparatus which keeps the coarser gravel, etc., moving on downwarde to the discharge end.

In most concentrators of this kind large pieces of gravel, etc., accnmulate at the riffles and do not allow the fine particles to he hlown or shaken off, thus clogging the riffles. In this machine, however, the coarser gravel is moved onward hy mechanical means eo it cannot pack. The mechines are warranted to stand the dry hot winds of Arizona and New Mexico. There is no leather or boards used in the construction of the concentrator. By a simple addition, a feed and tailing elevator is attached hy which the hopper is fed with the sand or gravel and the tailiogs are removed out of the way. With these attached a hurro or horse runs the machine. Light machines are made for a man to run hy hand. The makers of this apparatus have seen the defects of the dry ore concentrators and have endeavored to remedy them. It works very rapidly, and the one we saw had a capacity, we are told, of three tons per hour. Ordinary placer gold, shot, etc., was readily caught in its riffles. The concentrator is quite simple in construction, not liable to get out of order, and appeare to he well adapted for its work. More or less hlast can he given to work heavier or lighter etuffs. A hard graphite luhricator is used on the journals, and is applied in a peculiar way. This ie of advantage in hot climates like Arizona, New Mexico, or Mexico, where ordinary luhricators do not answer. There ere in these conntries thousands of acres of ground which cannot he worked except with machines of this kind, hut which can he made avaiahle when worked dry.

THE Chrysolite M. Co. paid a dividend of $100,000 in New York on the 10th. This is a Leadville property.

MINING SUMMARY.

The following is mostly condensed from journals puhlished in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

MORNING STAR.—*Monitor-Argus*, Aug. 16: Two more men were added to the force already at work on the Morning Star tunnel, this morning. They are laying track, retimhering and cleaning out the debris that has accumulated since the former owners shut down work, a number of years ago. They expect to have the tunnel in condition to commence taking out ore hy the first of next week.

THE work on the Illinois-California has been commenced hy the contractor, John Ellis.

IT is reported that Lewis Chalmers is having the machinery in the Exchequer mill overhauled, and expects to commence crushing in ahout 3 weeks.

THE owners of the Triumph are still working on their claim. They must have found the real color, we judge, from the active interest they are displaying.

AMADOR.

SPRING HILL.—Amador *Sentinel*, Aug 10: The shaft of the Spring Hill mine, near here, is down 300 ft. Encouraging rock is found, but it is intended to thoroughly develop it, and the sinking will he prosecuted to a further depth of 200 ft.

EMPIRE.—The water supply having slacked up, steam is being used at the Empire mill. Everything is moving along as though a $250,000 law suit was not pending. There is talk that the Merchant's hank has offered to scil its interest in the Empire to the Pacific Co., or they will buy the Pacific. Separate managements, as at present, will he of the most henefit to Plymouth. Drifting from the north shaft, toward the Alpine line, has been going on for ahout 3 weeks. It is intended to prospect clear to the Alpine line, a distance of 500 ft, unless a pay chimney is sooner struck.

BUTTE.

TREASURE BOX MINE.—Oroville *Mercury*, Aug. 13: But few of our citizens have any idea of the extensive mining operations that are being carried on near Thompson's flat. Tuesday, in company with the superintendent, Mr. Harris, we paid a visit to the works. Although the work has been in progress but a short time, still they have erected a hlacksmith shop and have two or three small buildings in the course of construction. The mouth of the tunnel is situated just ahove what is known as Black flat, about half a mile from Thompsou's flat, at the hase of Table mountain, and is reached hy a road which the company has just built. The tunnel is 6x6 ft in the clear and is timhered and lagged. The main tunnel is now in about 200 ft and is being run due north. There are 2 shafts being sunk on the line of the proposed tunnel which are down to the level of the main tunnel, and in the first they have run off on the line 70 ft, and in the second 16 ft. These shafts are 450 ft apart, and between these and the mouth of the tunnel 3 air shafts have been sunk. Mr. Harris states that he will not strike hedrock until he comes to the old Wardwell shaft, which lies in a direct line of the tunnel, and just above which they propose sinking another shaft. Early residents here will remember that the Wardwell shaft went down to hedrock and paid very rich indeed. The proposition is to drive the tunnel dus north 1,500 ft, which will hring it just under the lava caps, and then to swing it sufficiently to the west to strike the northwest corner of the company's claims. The swing of the tunnel will just clear the series of claims owned in Morris ravine. They estimate that the entire length will he one mile, and the object is to cut the old dead channel that lies under the lava caps of South Table mountain.

CALAVERAS.

BIG CLEAN-UP.—Calaveras *Chronicle*, Aug. 13: The Mammoth hydraulic, on Tunnel ridge, owned by J. F. Velth, Esq., has just finished cleaning up, after a run of 4 months. We have not heen informed as to the exact yield, hut hear that it is well up in the thousands. The Mammoth is one of the hest hydraulic claims in this portion of the county, and its proprietor is an experienced miner and knows how to work it to make it pay.

SOUTHERN ITEMS.—*Mountain Echo*, Aug. 6: A $10 nugget was picked up on Six Mile creek recently. The hoisting works on the McElroy mine are completed, and work is progressing as rapidly as circumstances will permit. Bennett & Co. are still engaged in sinking on the Raspberry mine. This mine in former times was very rich. We learn that Mr. Wm. Bovee, of San Francisco, has commenced operations on his mine and intends sinking a deep shaft. We visited the Dolan & Coggswell mine the other day and found it the most wonderful mine we have ever seen. It can hardly he called a quartz mine. It is simply a mountain of talc and quartz mixed, which yields from $5 to $8 per ton. There is no such thing as refuse in this mine; everything is worked from the surface down for a depth of 80 or 90 ft, and the hill for over 100 ft. It needs to be seen to he appreciated.

EL DORADO.

CRIZZLY FLAT.—Cor. *Mountain Democrat*, Aug. 13: Another set-hack has been caused hy the shutting down of the Mount Pleasant mine. We always write to speak of the Mount Pleasant mine as being the foremost and hest, hut forget to mention that it is the only one that has been prospected to any great extent. The Mount Pleasant shaft is now only 400 ft deep, hut, from present appearances, the company are going to work in earnest. Supt. Bradley, of the Crystal mine, was in town yesterday, and reports that the shaft siuking in that mine is still going on. Nearly every week we are visited hy men wanting to bond mines. We prefer capitalists. These middlemon are not doing us any good. They want to make it all, hut say that our prospectors are not willing to take reasonable prices. The Meltons are moving their mill nearer the river, which will give them an abundance of water-power. They will he kept husy crushing ore from the surrounding mines. Bullard, Drieshach and others are using the pick and shovel to good advantage. They are getting flattering prospects. They are go-ahead fellows and have great faith in our mines.

INYO.

GENERAL ACTIVITY.—Inyo *Independent*, Aug. 13: We are certain that there are at present more properties being worked in the county than at any time for a number of years. There has been during the year a very large aggregate yield of precious metals, the exact figures of which cannot and never will he ohtained. The individual owners and the companies operating hereabouts are averse to reporting the hullion yield. The immense product of hase hullion at Cerro Cordo, Darwin and Lookout can only he approximated, should any future statistician ever attempt to dig up the hottom facts.

BISHOP CREEK.—The interest of course centers around the great Polita mine. About 30 men are employed, under the general superintendency of George Story. We hear that the force has been decreased in the main 100-ft incline on account of had air, and a new perpendicular shaft started about 120 ft northward, for further development and for ventilation purposes through a connecting drift. The company is bringing in water by pipes from the head of Redding's canyon, a distance of about 2½ miles. There is a cluster of claims located all about it in every direction, including the Nugget and and La Ninya, east and west extensions, and many others. The Red Cloud, adjoining La Ninya, under bond to Russell & Loose, is working a small force, and at 30 ft in depth has the same ledge of rich gold ore as the more noted mines. In Redding's canyon several new mines are being opened by Calvin, Giles, Thompson and others, all looking well.

DEEP SPRINGS.—Across the Range, nearly east from this district, lies Deep Springs, where some 20 men are at work upon different claims, the most prominent being the California (old "Hard Cash"), Elio, Piouecr, Half Dol-

lar, Trade Dollar, Eighty-One and others on the west side of the valley, and the Zulu, Scout, Greenly, Cairo, Lake, Fortuna and others on the east. Messrs. Griswold & Todd, we understand, have purchased a mill and will put it in operation in the valley. Something of a detailed description of these mines will be given soon.

BEVERIDGE GOLD.—The Taylor 5-stamp mill, running on Keynot ore, cleaned up the proceeds of 180 tons on the 10th inst. There were 1,355⅞ ozs, worth $16.18 per ounce, amounting to $20,600. An increased force is to be put on the mill and the battery run day and night. All the parties interested state that the next month's yield will not fall short of $35,000. The old Kearsarge is beginning to promise well. With a small force at work, Supt. Grey is steadily opening a ledge of ore assaying from $200 to $1,200 per ton in silver. In the same district, it is rumored, work is to be resumed on the deep Independence tunnel, to tap the rich Rex Montis series at a great depth.

MARIPOSA.

A PROSPECT CRUSH.—Mariposa *Gazette*, Aug. 13: Mr. Mast, owner of several good mines on the other side of the river in the vicinity of Coulterville, has taken out 50 tons of rock from the mine near Tim Sheehan's, and is hauling it over to the Martin & Walling mill to have a prospect crush made.

PROSPECTS OF A SALE.—Mr. A. G. Black, of Bull creek, is taking the water out of the compromise and Marble Spring mines. We learn he is expecting capitalists from below to make a purchase.

RECENT OPERATIONS.—The Yosemite, or No. 9 mine, near Hornitos, is now running 25 stamps on excellent rock, under the supervision of the experienced miner, Mr. J. F. Thorn, with every indication of big returns. They will shortly run 5 more stamps, making 30 in all.

BIG STRIKE.—We are informed that a very rich strike has been made in the silver mines near this place. This company drive their works steadily ahead, making no blow whatever, and it is the hardest thing imaginable to find out anything in regard to their workings. We hope the reported rich strike is so, and we have every reason to believe it is by the way their business is conducted.

MONO.

BODIE.—*Free Press*, Aug. 16: The fact that the water has been so far conquered in Bodie district that levels are being run in the 4 deep shafts 200 or 300 ft under the old water line is a most gratifying circumstance. It would seem that we are very shortly to get a glimpse of the riches which have heretofore been guarded by what has been an impassable barrier, but which now has given way to the indomiteble pluck of the leading spirits of the district. The Lent shaft has reached a depth of 700 ft, and within a very few days a drift will be running for the famous Fortuna ledge, which will thus be developed at a vertical depth of considerable more than 100 ft below the lowest point worked, and on the slip of the vein perhaps 200 or 300 ft deeper. The Fortuna is a vein which the best judges of mines who have ever examined this district do not think will ever "quit." It is wider and stronger at its deepest development than anywhere else. Its discovery on the new level in good shape will give an immense "back" of ore, in addition to that now depended upon in the upper levels. This is one of the interesting points in the mining situation here just now. The Red Cloud is another. There a crosscut is already in 07 ft west from the shaft on the 600 level, running for the Concordia ledge. This ledge is the vein made of the Silver hill series. Its resemblance in many respects is most remarkable to the great Comstock lode. In size it is immense, its width being from 50 to 200 ft, and this great vein is the puddling in which our bonanza plums must be found. Successive rich ore chimneys have been found along its course, in the Concordia, Oro, Addenda and Dudley mines, through all of which it undoubtedly passes. The best developed chimney has been found in the Oro mine, over 200 ft in vertical deptb, commencing at a depth of about 300 ft, and continuing down to the 250 level, below which a winze is now being sunk. We believe these chimneys will make into bonanzas below, crowding out the clay and filling the vein to great width with rich bodies of silver ore. The water difficulty has heretofore caused out many of the weaker companies with good prospects, which it may be anticipated will resume work at an early day. Among the companies which have never ceased work at any time may be mentioned the Blackhawk, South Bulwer, Con. Pacific, Boston Con., Tioga and others which have been named. The foundation of the new Bodie Tunnel mill is complete, and the advent of the contractors is awaited.

NEVADA.

EMPIRE MINE.—Grass Valley *Union*, Aug. 13: This old mine, which has been one of the chief gold producers of the Grass Valley district for 25 years, during which time it gave an output that footed up many millions, but which during last year took a season of rest, is again in complete order, and being extensively worked. Since the pumping out of the mine, the main incline has been put in thorough repair, heavier pumps put in, and improvements made to boilers and machinery, which has reduced the consumption of fuel nearly one-half. Old drifts have been cleaned out and re-timbered, drifts extended and stopes opened to admit of extracting regular supplies of ore for the mill. Since pumping out the shaft it has been sunk from the No. 12 to the No. 13 level, which latter has been driven 50 ft south. Ore is now being extracted from the Nos. 4, 6, 9 and 13 levels, all of fair quality, and from No. 4, rock is being produced that will yield $50 per ton. Above No. 13 level there are 100 ft of solid backe, a strong vein, from 2 to 2½ ft thick, of fair grade ore, but better ore will be found as the drift is extended south into the old Rush & Leyton ground, as two distinct chutes put down from the upper levels into that part of the mine. Everything is looking encouragingly in the Empire, and it is believed that the old mine has years of valuable life in it yet. At the present time there are nearly 100 men at work in the mine, by the day, tribute and on contract, and this number will be increased as the drifts are extended and the stopes opened. Capt. John White is the general superintendent of the mine, and Charles Stokes underground foreman.

PEASONY MINE.—Grass Valley *Union*, Aug. 1: Work was interrupted in this mine the latter part of last week, owing to the break in the V flume, which cut off the water power to run the pumping and hoisting works, causing the water to rise in the shaft, and stopping the sinking for several days. The work is again going ahead, and it is expected that the depth of the shaft will reach 200 ft in the next 3 weeks. Upon attaining that depth, the contract made by the Oakland company with the owners of the Peabody location will have been fulfilled, and the further operations of driving drifts will be done under the auspices of the joint ownership, which will be an incorporated company. The preliminary steps for incorporation were taken on Monday, the number of shares being fixed at 60,000, of a par value of $5 per share. It is in contemplation to put up steam-hoisting works, and dispense with the use of water, as there is too great a liability to interruptions to a constant supply.

PLACER.

FOREST HILL NOTE.—Placer *Times*, Aug. 13: The Hidden Treasure mine company has lain a new track through the entire length of the tunnel in their mine, and are now ready to resume work in their mine. Rumor says Breece & Wheeler, at Bath, have struck very rich pay in their mine. The Dardanelles Co. are putting a number of men to work in their mine, good pay dirt having recently been struck.

RICH ROCK.—*Herald*, Aug. 13: We were shown a piece of rock a few days ago from the Tremilling Bros.'e mine, on Bellvue hill, that was rich enough for specimens. Many very rich crushings have been taken out of this mine, and its richness seems to increase. The specimen referred to was taken from the drift at the bottom of the shaft, 160 ft from the surface. We understand from Ned Tremilling, who showed us the specimen, that the ore in the lower level is all remarkably fine, and that while the mine has paid them well from the start, their prospects were never so flattering as at present.

PLUMAS.

MINING.—Greenville *Bulletin*, Aug. 13: The Indian Valley drives steadily along. There is nothing new to report. Under the present management the mine is like any other settled industry in one of the older States. The same is true of Green Mountain, Gold Stripe and other mines in the vicinity. Where enough capital is invested to provide suitable machinery and the same is placed under skillful operators, good returns are regularly obtained.

CHLORINATION WORKS.—A great deal of the ores here contain sulphurets. The only reduction works near us are at Sutter creek, but the steepness of the road puts them out of the field for Greenville. An establishment of the kind is much needed here. A custom mill could be run in connection with it.

JAMISON NOTES.—Cor. Plumas *National*, Aug. 13: The richest mining strike in the southern part of Plumas since the discovery of the Eureka and 70 mines, was made a week or two ago by Felix O'Neil and Wm. Roach, who associated with themselves Wm. Roberts. The strike is on the spur of the mountain that divides Squirrel creek from Poplar creek, almost on the summit of the mountain. The lode runs north and south, dipping east, and is from 2 to 2½ ft thick; one wall porphyry, the other chlorite slate, and only opened in two places, about 100 ft apart, shows by the surface indications to be continuous for several thousand ft. The mountain side, which is very steep, is strewn with quartz, most of which is covered with little specks of gold, plainly visible, making it a wonder that it has remained undiscovered so long. One of these bowlders was found by John Nichols some years ago, and he and Squire Lannes prospected for 2 years to find where it came from, but without success. O'Neil & Co. will start a tunnel on the east or Squirrel creek side of the mountain to-morrow morning. This will tap the lode not very far from the crest, and as the dip is toward them they will not have far to run. The ground is favorably situated for draining 600 or 800 ft in depth. As is usual in such cases, the country has been all claimed, and notices posted for a long distance on the course of the vein—John W. Hill, John Swan and Alloth getting in on the first extension north, and they are now running a tunnel. Paul Serrand and others have the first southerly extension. In proof of the old adage that "misfortunes never come singly," while Hill was up making the location, Alloth, while walking up a water way that run through an old dump in their claim, picked up a chunk of quartz, about a pound and a half in weight, that contained over $100 worth of gold, which had evidently passed through the sluice while piping on the mountain side a couple of years ago.

SIERRA.

QUARTZ AND GRAVEL.—*Mountain Messenger*, Aug. 13: This week G. F. Orr, superintendent of the Big Emma mine, Rasp's ravine, Kanaka creek, 6 miles southeast of Forest City, called on us, and reported that while prospecting for quartz, gravel was struck. A shaft has been sunk 9 ft to the bedrock, and river-wash gravel found that paid 15 cts to the pan. Fifty thousand dollars have been put up for developing this ground. The quartz ledge was discovered with a diving rod. A flume 800 ft long and a large derrick are to be constructed. Drs. Martin & Draper, of Oakland, are owners.

SIERRA CITY.—Haskel Peak has sunk 50 ft at the end of the tunnel, finding prospect of quartz gravel with fine gold. Ten hundred and one are now running over their channel of blue quartz gravel, appearing better than ever before, the prospects well in fine gold. Blue Gravel is still running their tunnel through blue quartz gravel that has prospected well in fine gold—now in 450 ft. Eureka Con. has a large force at work, pushing their tunnel ahead rapidly as possible. Washington ere now making good progress with their tunnel in cement and gravel.

WATER.—The Extension company is preparing to pump water from the Phiocene shaft for use at their mine, Forest City. A flume over a mile long will be needed to drop the water into the South fork of Gregon creek. The water will be used to drive air into the mine and to wash gravel. The company now has about 800 carloads of gravel in the dump. It has also ordered 2,000 running ft of steel rails.

GOLD BLUFF mill has been running for some time, and the prospects are good. Parties will be up in the spring from Oakland to search for the extension of the Rainbow quartz ledge. They claim 6,500 ft of the lode. Work on the Good Hope quartz mill is progressing. Mr. Hewson, the owner, has not yet returned from below. Two cast-iron mortars, weighing 5,300 each, were shipped to the Sierra Buttes quartz mine this week by Forbes & Taylor, proprietors of the Downieville foundry.

CONTRACT.—The Ex. Co. has let a contract to M. Herp to cut 100 cords of wood at the Pliocene shaft at $3 per cord. Bald Mountain Co., Forest City, is working over 100 men, and this mine is now said to be again yielding handsome returns. Five carloads of gravel, shipped by the M. X. Co., Forest City, this week yielded $21. The water for washing was kindly given by the Bald Mountain Co.

RUBY.—The Ruby Co.'s tunnel is in about 2,000 ft, with moderately soft bedrock. The use of the Burleigh drill has been discontinued. It is the opinion of the owners that they are nearing or are undercutting a channel. Savage has raised up 20 ft, and gravel is expected 30 ft above. Tunnel is in 1,000 ft, and is 1,200 ft below top of ridge. The upraise is being pushed through granite mixed with slate, quartz and syenite.

SISKIYOU.

KLAMATH.—*Democratic Times*, Aug. 12: Mining the bed of the Klamath river in Siskiyou county is proving more remunerative than ever this season, and a large number of claims are being worked. One company, composed of 3 white men and 5 Kanakas (some of this latter former residents of this place), has struck it very rich, one panful of dirt from their mine paying $50 and a bucketful $500. They expect to take out $100,000 during the season.

TRINITY.

BUCKEYE COMPANY DOINGS.—Trinity *Journal*, Aug. 13: Mr. S. K. Holman, superintendent in charge, kindly furnishes us the following items touching the Buckeye ditch and the progress made in repairing last winter's damages: "The repairs decided upon last spring—that is, the opening up of the old ditch between Bolt's hill and Van Matre's creek, a distance of 22 miles—were completed July 31st. The necessary repairs and ditch cleaning proved more extensive than the March examinations indicate, but far below in cost as well as extent—this wild and extravagant reports current during last winter and the early spring. The work done covers putting in 200 12 ft boxes, 4 ft wide and 3 ft high, in strings of 2 to 35 boxes, distributed over 13 miles of ditch and representing about 40 breaks; cutting and putting up 124 sets of timbers, separate from the boxes and lagging and covering the same; running a tunnel 232 ft long, in rock 6 ft by 5 ft in the clear, and timbering and lagging the same top and sides; walling up sundry breaks at head of ravines, shoveling out slides, caves, etc, thoroughly cleaning the ditch for 14 miles and doing much other work which, though expensive, does not show on the surface. All has been done as rapidly as true economy dictated, with a moderate gang of men who have worked faithfully and efficiently under the able leadership of Mr. E. N. Sbedd.

NEVADA.

WASHOE DISTRICT.

OVERMAN.—*Enterprise*, Aug. 16: The drift on the 2275 level has been extended 45 ft without meeting with any material changes in formation.

CHOLLAR-NORCROSS-SAVAGE SHAFT.—The hydraulic pumps are running at 6½ strokes, handling all the water from the 2400 level.

CHOLLAR AND POTOSI.—We are cleaning out the joint drift on the 2400 level, preparatory to the resumption of prospecting.

CALEDONIA.—The pump has been run an average of 9 hours per day, consuming four and one-seventh cords of wood per day. The Forman shaft has been sunk and timbered 15 ft; total depth, 2,125 ft.

CON. IMPERIAL.—Have been engaged this past week in digging drain and putting in boxes to carry the water from our 2900 and 2100 levels to the Jacket pumps.

HALE & NORCROSS.—The 2400 winze is now 105 ft deep. We are cutting out a station at the 2500 level. Will resume sinking in a few days. The flow of hot water continues strong.

CON. VIRGINIA.—On the 2300 level the Joint Best & Belcher crosscut has been advanced 26 f On the 2500 level the joint California winze has been sunk and timbered 10 ft, and switch plates put down.

UTAH.—The west drift on the 400 level is now in a distance of 10 ft, with the face in a favorable looking formation.

CALIFORNIA.—During the week 61 tons and 400 lbs of ore have been extracted. On the 5200 level the joint Con. Virginia winze has been sunk and timbered 10 ft, and switch plates put down. Bullion shipped to the value of $3,491.65.

UNION CON.—The 2700 station at the bottom of the joint Sierra Nevada winze has been completed. The joint Mexican east winze on the 2500 level has been sunk and timbered 10 ft.

SIERRA NEVADA.—On the 2700 level joint Union Con. drill hole No. 2, from station, extended 65 ft, and drill hole No. 3 extended 75 ft. Taking out main pump and cleaning out shaft. Bullion shipped, $5,362 88.

CANDELARIA DISTRICT.

MOUNT DIABLO.—*True Fissure*, Aug. 3: Drifts are being run east and west from the north crosscut at the bottom of the main winze, called winze No. 1, from the 3d level. The west drift shows a 2-ft ledge of ore, assaying from $40 to $50 per ton. The east drift is showing a ledge of low-grade ore that looks promising. In the face of the west drift, on the 2d level, is a streak of ore assaying from $66 to $73, and the appearance is very encouraging. A drift is being run west from the main stope on the 1st level, and has a good vein of ore in the face. A shipment of bullion was made on the 5th instant, amounting to $11,-318.10.

NORTHERN BELLE.—The development in the 1st level, mentioned in the report of last week, looks fully as promising as it did then. The other shaft levels show no material change, and are yielding as usual. A large amount of work is being done on the adit and the levels above, and they look as well as a week ago. The 9th especially presents a fine appearance. Mill No. 1, which shut down on the 5th inst. to clean up the Mount Diablo crushing and to make some slight repairs, started up again on the 7th inst. Bullion shipments for the week ending August 10th were $19,978.32.

HOLMES.—The winze in the main tunnel has reached a depth of 30 ft, and good headway is being made, the ground being of easy breaking character. The north drift has advanced 12 ft. It has been very hard in the face, but is coming in softer. A tunnel has been started at a point down the hill 285 ft perpendicular from the old workings, from which some developments of an important character may be looked for in time.

GEN. JACKSON.—Work in the drift continues in good looking ground, and fair progress is being made. The ore still continues in strength in the drift, and is of better grade than that of last week. The Gen. Jackson certainly bids fair to become a mine of more than ordinery merit.

CHERRY CREEK DISTRICT.

THE TEACUP SETTLEMENT HANGS FIRE.—White Pine *News*, Aug. 5: Dispatches received here during the early part of the week were of such a favorable nature as to lead our people to believe that a speedy settlement of the affairs of the company was pretty certain. A dispatch received Thursday afternoon, however, dissipated all such hopes, and leads to the impression that the overtures made by Mr. Kobbe to the creditors when here were anything but made in good faith. This last dispatch says: "We have contracted to crush 1,000 tons Exchange ore. Will pay off labor bills. Will the creditors except company's notes, payable in three months, and guarantee not to disturb us." This is just what the creditors refused to do when Mr. Kobbe was here, and they have not changed their minds since then.

DUN GLEN DISTRICT.

BUILDING A MILL.—*Silver State*, Aug. 11: The Auburn Con. G. M. Co. of Dun Glen have decided to build a first-class 20-stamp mill in Badger canyon, on the east slope of the Range near their mines. The machinery has been ordered, and the Superintendent, L. S Hodges, invites proposals for hauling it to the mill-site and for erecting the mill.

ESMERALDA DISTRICT.

PROGRESS AND DOINGS.—*Herald*, Aug. 13: The mining news from all sections of the county is very flattering, and bears us out in the assertion that Esmeralda county will in a few years be sending out more bullion than any county on the Pacific coast. New discoveries are made almost every day, and the rock sent us shows rich in gold and silver. Wherever the ore is worked the result is always good, and in most cases the returns are exceedingly high, in some instances yielding thousands of dollars per ton. Mines in Esmeralda district are numerous that have fine prospects, and they can be purchased at reasonable figures. We learn that New York parties have become interested in two prominent properties in Aurora, and work will commence on one of them shortly.

THE CENTENNIAL.—The work for the week has been in the incline, which has been driven down about 6 ft, making its entire depth 236 ft.

SILVER LINING.—An incline is being sunk on the Silver Lining, and shows the ledge to be a continuation of the Humboldt West, which mine it joins on the north.

CORTEZ.—At the bottom of the incline the width of the ledge is now 6 ft, and the quality of the ore splendid, as formerly; and throughout the mine, wherever work has been or is being done, excellent paying ore is seen. We hope the Cortez mining company will soon commence the erection of a mill to work its own ores, as we need no assurance that it could keep a 20-stamp mill clattering away all the time on ore, the returns from which would astonish "the oldest settler."

EUREKA DISTRICT.

GEDDES & BERTRAND.—*Sentinel*, Aug. 14: Dick Berryman, foreman of the Geddes & Bertrand mining company at Secret canyon, has a number of men employed in tearing down the old smelting furnace to make room for the new 20-stamp mill that is to be erected immediately. All the material for the mill has been ordered in San Francisco, and the carpenters, millwrights, etc., will commence building operations in a day or two.

THE BANNER MINE.—The Banner mine is looking better than for a long time past. There are several thousand tons of ore in sight and of higher grade than has usually been obtained. Mr. McGarry will put on an increased force of men at once, and send down the ore in greatly increased quantities. He is satisfied that the Banner will give a better account of itself in the future than in the past.

THE ALPINE.—This is the name of a mine owned by Jobu Baker and Tommy Hailey. It is situated on the summit of Prospect mountain, between the Banner and Orange mines. A miner, doing the assessment work on the Alpine, has just developed a fine showing of high-grade carbonate ledge. The prospect is a most flattering one, and will doubtless be followed up until the extent of the body is determined.

ARIZONA.

SILVER DISTRICT.—Cor. *Journal*, Aug. 10: The result of development in this district of remarkable lodes continues very favorable. The many huge coutact ledges in north Silver district, of which there are at least 10 miles of massive croppings on the different channels, and now in a condition for inspection, as the Territorial road has been completed and wheeled vehicles can be driven to within a half mile of the outside claims.

THE Clip mine, which is showing up as one of the most remarkable claims in the district, in that the entire shaft averages an assay of 70 ounces silver to the ton, milling rock. Milton Santee is the owner.

THE first north extension is the Alberta mine, upon which but little work has been done. It shows a continuation of the same variety of ledge matter as on the Clip, and will soon be opened by the Chicago company.

THE Black Rock has a gang breasting off the massive croppings, and the result is highly satisfactory. The scarcely any is added to the waste dump, and the milling rock will average 50 ounces to the ton, and the lowest grade of furnace ore, carbonates and black galene, assay 170 silver to the ton; this, mind you, on the surface; and from the various shallow cuts now in on the ledge the surmise is favorable to 1,200 ft in length of just such a variety.

THE Silver Glance tunnel, now in 100 ft, has tapped the ledge, and struck it rich in a foot of high grade, black galena ore, which is increasing in width as the tunnel progresses; and, at the same time, on the same shift, a large body of high-grade carbonate ore was struck in the shaft on the same lode.

IDAHO.

WOOD RIVER SMELTERS.—*Times*, Aug. 10: Four smelting furnaces, having an aggregate daily capacity of 95 tons, are now on Wood River—one, of 5 tons capacity, is being erected at Bellevue, and will probably be heated up the middle of September. Another is going up about 4 miles beyond Galena. It is being erected for the Senate Co., and is of 30 tons daily capacity. The road from Galena to the site is nearly completed, and the furnace will probably be "blown in" about the 1st of October. The Philadelphia Co.'s sampling, smelting and separating works, at Ketchum, are being erected as rapidly as men and money can do it. The office and boarding-house are completed, and the road to the head of the West Fork is nearly finished. The works will have a daily capacity of 40 tons. The furnace will probably be ready in about 40 days. The Wood River Co.'s smelting works, near this city, are running right along, and turning out bullion by the carload. The fifth was shipped to-day. It went by way of Blackfoot, as no teams could be got to take it to Kelton.

MONTANA.

MOULTON.—Butte *Miner*, Aug. 9: A livelier impetus has been given to the operations of the Moulton mine within the past 10 days. Yesterday the main 3-compartment shaft of the mine had reached a depth of 450 ft—50 ft over half the distance for which sinking has been contracted for, which is 800 ft. It is a model shaft. No trouble is experienced from water, and the rock in the bottom throws out well.

ALICE.—The ore bodies in the 100, 200, 300, 400, 500, 600 and 700 levels are reported to be presenting their customary appearance. The product of the mine, which is not worked to its full producing capacity, may be placed at 75 tons per day on an average. The mine is so extensively opened that the present per diem ore product could readily be doubled without much extra exertion, if the ore was required for milling purposes. Both Alice mills are running smoothly, and the mine is paying monthly dividends that will aggregate for the year 1881 the handsome sum of $480,000.

LEXINGTON.—The Lexington main shaft is now down 195 ft, and is timbered 190 ft deep. The rock in the bottom is tight and the volume of water medium. The progress of the shaft downward has been something over 1 ft per day for the last week. Plenty of free-milling ore to supply the Davis 10-stamp mill is taken from the mine daily, and that is the present per diem ore product. The sale of the mine is looked upon as being as good as made.

BELLE OF BUTTE.—Work on the Belle of Butte mine actively continues. Driving the east level from the main shaft on the ore vein is developing a fine chute of rich ore. The vein is strong and measures nearly 15 ft wide where it has been crosscut. The ore coming from this level, which is to the east about 16 ft, is high grade, assaying 88 ounces in silver, and carrying gold. Free gold can be seen in some of the ore coming out. Crosscutting through the vein in the west level is going on. A short time ago the Silver Bow Co. purchased the Belle of Butte for $25,000. The company has already developed enough first-class ore to pay for the mine.

ACQUISITION.—The new main shaft on the Acquisition mine was down and timbered to a depth of 175 ft yesterday. Within the past week the shaft has been sunk about 10 ft. No indications of striking the ore vein are met in the shaft.

STEVENS.—On the Stevens mine work is now continued to sinking the main shaft. Sinking is accomplished slowly, as the rock is decidedly hard.

NEW MEXICO.

GEORGETOWN.—Cor. *Herald and Southwest*, Aug. 6: Georgetown has been a paying camp from its discovery down to the present time; but, since the purchase of some of our mines by the Mimbres M. Co., our camp has taken on a different appearance altogether. This company, having ample means, has introduced good and powerful machinery, both into their mills and mines. They are thus enabled to work and develop their property with much greater facility than heretofore, when elbow grease was all we had to depend upon. This company is now employing about 200 men at the mines, besides those employed at their mills. With teamsters, wood choppers, coal burners, etc., the force is probably 250 men in all. They are now extracting 15 tons of ore per day. They have recently purchased the Big Cedar, the Glanorgan and the Centennial mines, which will add considerably to their mining property in the camp, and, it is to be hoped, will also add considerably to the output of metal. Their mills are now turning out from $30,000 to $40,000 per month, and their business appears to be in every way in a thriving condition. There are some other mines in our camp not owned by the above-named company. To wit, the McGregor, the Commercial and the Satisfaction. The McGregor is now worked very profitably by the owners, Alex and Malcolm McGregor. They are taking out some of the finest ore that ever came from their unusually rich mine. This ore is not only rich, but is also very free, and is easily worked in the mill to over 90% of the assay. This is now, as it has always been, a paying mine, and we have often thought that we would not want a better thing than to own it and the Commercial, which is contiguous, and a good stamp mill. There is a chance for profitable investment here, as we are satisfied that the owners of these mines will sell at fair figures, notwithstanding they are paying them well under the difficulties above named. Messrs. Lucas & McKay have recently returned from the Cuchillo Negro county, east of the Mimbres mountains (Black range), where they have been looking after their mining interests. They report the mines in Apache district looking very well indeed. They have had assays from some of their mines situated near the South Fork of the Cuchillo Negro creek. Assay No. 1 shows $10.32, No. 2, $898.32 and No. 3, $426.15. These assays were made by Dr. E. Andrews, of Santa Fe, and prove the fact that they have some very high-grade ore, the samples all coming from near the surface.

OREGON.

CLEAN-UP.—*Democratic Times*, Aug 12: Jacob Wimer and his son, W. J. Wimer, of Waldo, were in town this week. They brought with them their share of the gold-dust that has been taken from Wimer & Simmons' claim, in Josephine county, which is enough to make anyone happy. Over $20,000 have been cleaned up thus far, and this season's work will not be completed for a few weeks yet. There are few better pieces of mining property then this. The owners are men of energy and enterprise, and deserve their success. S. Arnemith is engaged in wiggdimming Squaw creek. Several parties are prospecting for quartz on Wagner creek. Yaudes, Saltmarsh & Co., of Sterling, have finished cleaning up, with satisfactory results. S. C. Carter has struck a good pay streak on Squaw creek, from which he took $8 in two days recently. Kleinhammer, Towne & Reynolds, of Sterling, will finish cleaning up in about six weeks. Water is getting light there. Jos. Eppersou was in town last week attempting to organize a company for the purpose of mining some ground on Steamboat with a hydraulic. Wm. Heeley and J. M. Dews, miners from Big Applegate, were in town yesterday, having made a clean-up that proved satisfactory. They will soon commence putting the Squaw Lake Ditch Co.'s mining property in order..

The Youth of California.

Four Stockton boys are under arrest for manslaughter. It seems that they were entertaining themselves by propelling a hand car along a trestle which was only the width of the track, waiting their opportunity to catch a Chinaman crossing the trestle. When an unfortunate Celestial essayed to cross they would rush the car upon him. The successful manner in which they pursued their fiendish sport is described by a witness in the Police Court, as follows:

The boys saw the Chinaman crossing the bridge, and one of them cried: "There goes a Chinaman." They immediately pushed the car toward the deceased. The Chinaman fell on his knees and elbows on the bridge close to the track. The hind wheel of the car struck the deceased and knocked him off the bridge. He struck a timber in falling and it turned him over. He fell sideways into the water and was drowned. Ten minutes before that the same boys had chased four Chinamen with the same car. Three escaped by running ahead of the car and by getting on the opposite bank before the car overtook them. One was caught by the car and escaped by catching hold and getting upon it. When the boys started the car after the deceased they kept yelling: "There goes a Chinaman; start her up."

The Stockton *Herald* says: These boys, or all but one of them, are members of Sunday schools connected with evangelical churches in this city.
